Poire Maria (*de Nantes*).—Tree very vigorous as a standard on the Pear stock, and is entirely destitute of spines. It seems well adapted for orchards; however, if cultivated as a pyramid the fruit would probably attain a larger size. Fruit nearly middle-sized, turbinate, about 2½ inches in length. Stalk thick and short; eye open, in a wide shallow cavity; the segments of the calyx drop off. Skin almost entirely covered with russet; brown reddish next the sun, and everywhere sprinkled with pale red dots; it becomes yellowish when the fruit approaches maturity. Flesh white, fine, melting, with abundance of sweet perfumed juice. Season, November. Raised from seed by M. Garnier, and fruited for the first time in 1853.

Beurré Antoinette.—Tree of moderate vigour, and is likely to be very productive. It will probably succeed best on the Pear stock and trained as a pyramid. However, as it has been but lately obtained, we cannot speak from experience as regards the mode of culture best adapted to it. Fruit variable in form, about 3 inches in length, and as many in diameter. Stalk rather more than 1 inch in length, woody, slender, yellowish-brown, inserted between some small projections. Eye open, shallow, and irregular. Skin smooth, pale green, changing to yellow at maturity, sprinkled irregularly with small russet specks. Flesh fine, melting, buttery, very juicy, and sugary, with a remarkably perfumed flavour. Season, October and November. Raised by M. A. Bivort.

Poire Fondante de Noël.—Tree very vigorous and productive, suitable for a pyramid, a form which it naturally assumes. Fruit Bergamot-shaped, about 2¾ inches in diameter each way; sometimes, however, it is longer from the base to the eye than it is across. Stalk nearly an inch in length, thickened and fleshy at its junction with the fruit. Eye open, irregular, in a shallow depression. Skin smooth, green, spotted with cinnamon coloured russet and sprinkled with some brown dots, especially next the sun; the colour changes to golden yellow when the fruit is ripe. Flesh fine, melting, very juicy, with a deliciously perfumed flavour. Season, December and January.

Belle après Noël is a synonyme of the above. The variety was obtained by Major Espéren. ‖

WOODS AND PLANTATIONS.—No. III.

WOODS are usually divided into a certain number of "cuts," by which means a portion of the underwood is saleable every year, having had eight years' growth. After its division into lots, it is sold by auction to the highest bidder, the woodman having marked such Oaks as he thinks should be left standing for a future crop of timber. In almost all cases, too, many of these trees are left to do justice to the underwood, and owing to the inherent sentiment of veneration for everything in

* For the knowledge of this I am indebted to Dr. Hooker, not having immediate access to the paper.

the shape of an Oak which our labourers entertain (probably derived from Druidical tradition) many weak etiolated things are left, being Oaks, which never thrive again, being suddenly deprived of all their shelter. The lots of underwood when sold are cut by the purchasers; too generally by persons unaccustomed to the use of the adze, the implement itself being frequently dull and notched; the roots of the stools are thus much strained and loosened, and the face is left high, and with rough jagged cuts, preventing the moisture from running off. It is seldom that the stools are cut down sufficiently near to the surface, and becoming higher with every successive cutting, they produce weaker and weaker shoots; and from not being cut upwards with a clean cut, they soon get rotten. Much of the work is deferred till too late, and, consequently, the supplies accumulated by the action of the roots are wasted and misappropriated.

When after being cut down the stools start into new growth, it is customary to leave every bud that pushes into existence, it may be to become a vigorous, straight, clean growth, but too often to be smothered and die, after having robbed, to no purpose, those which still survive.

This is not an overcharged picture of the way in which this department of sylvan economy is conducted. I will now proceed to suggest measures for its improvement.

In a former paper I proposed the separation of the growth of underwood from that of timber, and I fully believe that such a step would be a leading one in the proper direction. Every intelligent practical cultivator admits the importance of a free access of light, and the advantage of circulation of air. It is beyond doubt, that in the absence of light the wood of trees does not become properly constituted and solidified, and it was proved by that great philosopher and vegetable physiologist, the late Thomas Andrew Knight, Esq., that air in motion exercises a most salutary influence on the growth of trees. By the separation of timber trees from underwood, the latter would have the advantage of unmitigated light, while the stems of the former would not be wrapped in the gloom of tall, toppy undergrowths; and the air would penetrate among them, its gentle motion "enabling their fluids to circulate more freely," and conduce to the formation of woody matter. It is admitted by competent practical authority, that the wood of those trees which grow on the exposed side of a plantation or forest is of much greater density than that of those nursed in the interior, and it is of course more durable and valuable; with this well-known fact staring us in the face at every turn, is it not strange that we still persist, most doggedly, in excluding the light of heaven from our woods, and guard most effectually lest a zephyr should enter?

As the bright sun of scientific discovery cannot too often illumine the atmosphere of traditionary ignorant practices, or dispel too much the misty exhalations of empirical usage, I venture to quote from Mr. Knight's paper, printed in the Philosophical Transactions for 1803, the following account of an experiment on some young Apple trees, which is most conclusive:—

"Early in the spring of 1801, I selected a number of young seedling Apple trees, whose stems were about an inch in diameter, and whose height between the roots and first branches was between 6 and 7 feet. These trees stood about 8 feet from each other, and, of course, a free passage for the wind to act on each tree was afforded. By means of stakes and bandages of hay, not so tightly bound as to impede the progress of any fluid within the trees, I nearly deprived the roots and lower parts of the stems of several trees of all motion, to the height of 3 feet from the ground, leaving the upper part of the stems and branches in their natural state. In the succeeding summer much new wood accumulated in the parts which were kept in motion by the wind; but the lower parts of the stems and roots increased very little in size. Removing the bandages from one of these trees in the following winter, I fixed a stake in the ground, about 10 feet distant from the tree, on the east side of it, and I attached the tree to the stake at the height of 6 feet, by means of a slender pole, about 12 feet long, thus leaving the tree at liberty to move towards the north and south, or, more properly, in the segment of a circle, of which the pole formed the radius, but in no other direction. Thus circumstanced, the diameter of the tree from north to south, in that part which was most exercised by the wind, exceeded that of the opposite direction, in the following autumn, in the proportion of 13 to 11."

Here we have a decided proof of the advantage of a certain amount of air in motion, as evinced by the augmentation of the bole of the tree "most exercised." But while we would avoid the Charybdis of excluding all circulation of air, we must not split upon Scilla by giving no shelter; for in exposed situations it is a most important element of success. The point to attain is that happy medium which gives moderate shelter, but does not impede the play of light or air round every Oak or other tree of the wood, in all stages of its growth.

It strikes me that this could not be better accomplished than by having large woods divided into alternate zones of trees and underwood, the trees and bushes in the outside one being mixed, and left thicker for the purposes of shelter and matsine-nets, and thus the margin of it thinned and grouped with a view only to picturesque effect. It would certainly be better if proprietors, instead of selling their underwood standing, were to have it cut, sorted, and allotted by their own people, selling it by auction when cut. They would thus avoid the injury inflicted on the stools by unskilful hands. Nothing is more important than to cut down low and to level the stool all round with a clean upward cut for a finish. It greatly renovates very old and high stoolings to saw them down low, and finish them off smoothly with a sharp axe. [Certainly.]

The want of judgment which we constantly see in the practice of the spring cutting of hedges and underwood is much to be reprehended, and can only be accounted for by a want of knowledge of the laws which regulate vegetable life, or a blind adherence to old habits and customs. In the course of my experience I have not unfrequently heard it affirmed that late cutting would succeed best with thin hedges; but my own conviction is, and I give the opinion most advisedly, that the sooner after the "sere and yellow leaf" has fallen, our underwoods, which are in a fit state for the purpose, are cut down, the more vigorous the shoots of the succeeding year will be, while, if the operation is deferred till spring, the sap will have ascended, the buds will be swelling, and the energies of the plant will have been expended to no purpose. [Hear, hear.]

Dr. Lindley says, "Theory of Horticulture," p. 17, that roots "are perpetually attracting food from the earth and conveying it into the interior of a plant, where it is stored up till it is required by the young shoots of the succeeding season." Read this, ye foresters! Mark it, ye woodmen! And remember that you cannot practise late cutting with impunity. The vessels of every pole cut in the spring are full of sap, and therefore they will be less lasting for stakes or hurdles, while by that practice you are abstracting the food prepared in Nature's laboratory for the nourishment of a future growth.

I believe that there is no one thing "under the sun" on which more misconception prevails than there is with regard to pruning, simply because most persons regard it as a remedial art rather than a preventive one. It is too often accepted as the practice of amputating large branches, which have grown with undue vigour, or the removal of mutilated limbs by the saw; but by good gardeners it is generally understood to be the science of assisting the operations of nature in the growth of trees for specific purposes, and concentrating their energies to some particular end. For this, the gardener who would induce luxuriant and vigorous growth, thins the nascent shoots with his finger and thumb, not allowing the superfluous ones to become large, only to be removed by cutting; he prunes, too, as soon as the leaves have fallen, and wastes not the matter slowly accumulated by the roots. On the contrary, when he would induce a state of fruitfulness, he uses means of an opposite kind to attain his object—he resorts to late pruning, to pinching the summer wood, and other ingenious devices. The farmer, too, leaves not his Turnips to struggle for existence till the weakest are destroyed, to the infinite injury of the survivors. Why, then, are the principles which are recognised in the horticultural and agricultural world unworthy of the attention of the managers of woods? There can be no doubt that the produce of copse or underwood would be greatly improved if the embryo shoots were, in garden parlance, to be "disbudded," or, in more intelligible language, to be thinned, rubbing off the weakest as soon as formed, instead of retaining all that are produced to struggle together for existence.

I have hitherto confined my remarks to useful and profitable undergrowths, but on many estates it is necessary to have covert for game. Happily for this country the preservation of game is carried to a much less extent than formerly, and gentlemen in the present day attach more value to their waving crops of golden grain than to the annual massacre of hares, pheasants, and rabbits which used to take place. Game, too, from the facility of purchase, is now within the reach of tradesmen, and in common with many other things which were not, but now are, within reach of the million, it is less valued by the higher classes. It is probable that in the great progress of population and civilisation our wild animals will ere long become extinct, or "few and far between."

It is essential that a covert for game should be thick at bottom, but as our woods are managed we generally find that it is thinnest where it should be the most dense, the long straggling branches impeding the progress of the beaters, and holding next to nothing.

There are few persons of fortune who do not wish to have a limited supply of game, those who do so cannot do better than follow the advice of Mr. Brown, of Arniston, viz., to plant masses of evergreens in open spaces, such as Holly, Rhododendrons, &c., which would greatly enliven our woods and produce that charming variety which all who value the charms of a country life must fully appreciate. *Henry Bailey, Nuneham, Oxford.*

MARANTAS.

Plants with variegated foliage are now in much esteem for decorative purposes, and well they deserve to be so, for many of them are exceedingly useful, being striking and interesting objects irrespective of their flowers; and hence their beauty is of a more enduring character than that of plants which have no particular beauty except while in bloom. Unfortunately, however, the flowers of most of our finest variegated plants are very uninteresting; but this is of little importance, as the beauty of their foliage will always render them attractive and useful for decorative purposes. Several varieties of Maranta deserve to be ranked among the finest of our variegated plants, being free growers, with large finely marked foliage, which is not so tender and liable to become disfigured by any little mismanagement as is the case with many of our variegated plants. Persons about to commence the culture of this genus, who can only accommodate a few varieties, should procure the red and white veined kinds, which are very beautiful; but vittata is my own favourite, and is probably the most useful variety of the genus. These are somewhat expensive at present, but there is no risk of losing them, hence there is no danger of having to purchase a second plant, as frequently happens with amateurs in the case of hard-wooded plants. Young plants cannot be procured at a better season of the year than the present, for there will be no danger of injury on the journey while the weather is mild. When received, the plants should be placed in a close but not over warm house or pit, and kept rather dry for a few days until they get over any little injuries they may have received in travelling. Then examine the state of the roots, and give a moderate shift if necessary, using nice fibry peat with a small proportion of loam carefully broken up, and well intermixed with plenty of sharp sand and some lumpy bits of charcoal, to ensure the free percolation of water through the mass. Likewise have the pots well drained, for the Maranta requires a free supply of water while in active growth; but stagnant moisture about the roots is very injurious, spoiling the markings of the foliage as well as the general health of the plant. After potting, place the plants in a close warm pit or house, where they will not be exposed to bright sunshine, and water carefully at the root until they get hold of the fresh soil; but dew them overhead with the syringe every fine afternoon. If a brisk bottom-heat can be commanded, this will greatly assist in promoting active growth; but fine strong specimens will soon be obtained without it. When dull cloudy weather occurs it will probably be necessary to place the plants in a light rather airy part of the house, in order to prevent the foliage being injured by damp; but unless damp appears inclined to be troublesome, they may be allowed to remain in the warmest corner, and be kept growing on slowly. Syringing will of course be unnecessary in winter, except an occasional wipe on a fine morning, to clear the foliage of dust, &c.; and too much water must not be given to the soil. Attend to repotting in spring as early as may be necessary, giving moderate shifts, which are safer than large ones. If scale or insects of any kind attack the foliage, these must be carefully removed by means of a sponge and water, and this should be attended to before the foliage gets disfigured. By continuing this treatment for a season or two, fine large specimens will be obtained; and when this is the case they may be removed from the stove and placed in the conservatory, where, if they are afforded a close corner, and not over-watered or allowed to suffer from damp, they will be quite at home all the summer season. But they must be removed to where a temperature of not less than 55° is maintained as soon as cold damp weather sets in in autumn. Large specimens will of course require to be repotted occasionally, and this should be done as early in spring as there may be an opportunity of affording them a brisk temperature to stir the roots. With proper management, specimens will last for any number of years; and propagation is easily effected by dividing the old plants, or by means of offsets, which should be taken off with as many roots as possible, and kept close for a few weeks after potting, when they will be sufficiently rooted to be treated as established plants. *Alpha.*

Home Correspondence.

A Collector in the Crimea.—Allow me to suggest that it might be worth while for some members of the Horticultural Society to send a collector to the Crimea and Asia Minor, especially for Acorns, Pinus, and hardy plants. The officers in the army have other things to think of; and, alas! many are cut off by cholera. Now, there are in London, doubtless, plenty of young men, such as gardeners or nursery foremen out of place, who would be glad of such an errand; the expense would not be much, as a passage would be obtained in a Government vessel. If a number, say 10 or 20, were to join, the cost of the collector could be easily defrayed, and the results distributed among the 10 or 20 subscribers. I should be, for one, anxious to join in such a subscription. Or why does not some intelligent young man propose to go out of himself, and open a list publicly for subscriptions? The time of Acorns ripening is now near at hand. *C. D.* [We fear it is too late for the present season; otherwise the plan might pay.]

Mosquito Smoke.—In answer to "R. A. H." (see p. 565) respecting the passage referred to in Fortune's book on China, I have made the following note, unfortunately without the reference. "For keeping off mosquitoes the Chinese use the resinous sawdust of Juniper wood smeared upon Bamboo, which they find very efficacious." The word "smeared" is not clear; but the Bamboo can be only the vehicle, and the sawdust stuck upon paper, or other material, so as to hang up and burn gradually, with smoke and no flame, seems to answer the conditions. Whether, where Juniper cannot be got, other highly resinous woods (not medicinal) would answer the purpose, and whether the sick patient could bear enough of the smoke to expel the gnats, experiment may decide. *J. Prideaux, Plymouth, Sept. 5.*

Tritoma Uvaria.—This evergreen herbaceous plant, though introduced from the Cape of Good Hope so far back as the year 1707, is yet comparatively little cultivated in this country. In the course of my perenrinations I have rarely ever met with it; and where

in one or two instances I had the good fortune to encounter it, I found it in anything but a flourishing or perfect condition. When so found, however, it forms an object of surpassing beauty. About four years ago I received a small plant of it from Kew, which, after growing some time in a pot, was turned out in the spring of 1851 into an open border (having a north-east aspect, but sheltered from the south-west winds, which are very prevalent and destructive here), by a terrace wall. Here it appeared to be at home, for it grew vigorously, and in the autumn of the following year it rewarded me with a few heads of bloom, giving an earnest of what was in store for me when the plant itself should be more fully developed. This year my brightest hopes with respect to this plant have been realised. At the present time it is the most conspicuous object among the many plants by which it is surrounded. Its flower-stalks, which number 24, are thrown well above its flag-like and graceful foliage, some of them rising to the height of 5 feet, and sufficiently strong to bear unsupported the magnificent display of blossoms which cluster round their summits. It is a plant which, whether viewed from a distance or in close proximity, cannot fail to captivate, while it must be regarded as one of the brightest gems ever introduced from that rich world of floral loveliness, the Cape. Those whose object in flower-gardening is to combine beauty with effect cannot do better than grow this plant extensively, for it will be sure to reward them for any labour or skill bestowed on its cultivation. It appears to delight in a deep rich loamy soil; and as a proof of its capability to resist frost, I may mention that it withstood the severity of last winter uninjured. *Charles Winchester, Osborne. Sept.* 4.

Cherries.—I have forwarded you a specimen of the Merry, gathered from a tree growing in my garden at Wootton Bridge, Isle of Wight. The sort was procured from an old tree about five years ago; and the fruit, now sent with four others, were the first fruits of the young tree raised from the budding of that season. As I have known this sort of Merry these 50 years, and as it had the recommendation of being a large good kind of fruit, I was induced to procure some cuttings from the original tree, which is now become very old, and bud some young stocks; and having done so, I have now several young trees which will prevent its becoming extinct. The original is now standing in an old garden which is for the most part walled in, and, consequently, but little known. The weight of the fruit sent, when gathered, was about a quarter of an ounce with the stem. *J.* [The fruit is middle-sized, heart-shaped, black; flesh dark red, sweet and rich. The stone is large in proportion to the size of the fruit. It is a good variety of the wild Cherry called "Merry" in some parts of this country, and corresponds with the Merisier of the French ||]

Gnats.—If "R. A. H." will hang a few small bunches of Rue at the bed's head of the sick patient, he will find that the gnats will cease to annoy him. I have always found this simple remedy effectual, but perhaps a sick person may not like the smell of the Rue, but I should think it the least evil of the two. *G. D. V.*

Propagation of New Holland Plants.—September is the best month for putting in cuttings of New Holland plants. The compost in which the cuttings are to be inserted should consist of finely sifted peat and clean silver sand in equal parts; each pot should contain one-third of clear broken potsherds for drainage, one-third of the above compost, surmounted by one-third of clean silver sand; the whole should be pressed firmly together. The cuttings should be neatly inserted at convenient distances apart, under bell-glasses. A close pit or frame in a north aspect, where the bottom is both cool and dry (where the conveniences are limited), is the best situation that can be provided for the cuttings until they are rooted, when the glasses may be dispensed with. At the approach of winter the pots should be removed, washed, and should occupy a shelf near the glass, in the most airy part of the greenhouse. In order to ward off the effects of damp, the bell-glasses should be carefully dried every morning, about the same hour; and to still further guard against the silent though desolating ravages of this, often till too late, unseen enemy, the cuttings from half-past 7 to 8 o'clock should be exposed to the influences of the atmosphere. Early the following spring, the plants should be potted singly into 3-inch pots, in a compost consisting of two-thirds turfy peat, broken into lumps (previously scalded, to kill insects), and one-third sharp sand; pot firmly and drain well. The cool pit, but in a warm aspect, should again be resorted to, as furnishing the young plants with the best possible situation that they can have during the first growing season. *R. Miles, London.*

Victoria Regia.—It may not be uninteresting to know that this fine Water Lily can be grown in perfection in a much smaller tank and house than many suppose it possible for it to thrive in. It may now be seen in the most robust health, and flowering profusely, at Flitwick Manor, Bedfordshire, the seat of Mr. Brooks. The gardener, Mr. Hewetson, had a seedling plant of it sent him a distance of more than 100 miles, on the 12th of April last; he planted it as soon as he received it in a slate tank, 9½ feet long by 9 feet wide, and 3½ feet deep, in a compost of strong turfy loam and decayed cow manure, and I have not seen any plant of this Lily growing so luxuriantly, or flowering so freely. The leaves measure 5½ feet in diameter, many of them hanging over the sides of the tank. Other aquatics are growing in similar tanks with equal vigour, and are flowering abundantly. At present there are many beautiful flowers open on Nymphæa spodiana (?) and others are showing for flower. All were planted in the same compost, and have had comparatively but little fire-heat. *J. F., Luton Hoo Park.*

Roses on the Manetti Stock.—I have lately seen the most beautiful little Rose garden, in the picturesque grounds of J. Morris, Esq., at Sandgate, I ever beheld. Its history is as follows: for 20 years this spot had been appropriated to Roses, and the soil being very light and sandy, became at last so exhausted that Roses budded on the Dog-Rose refused to grow, even with abundance of manure mixed with the soil. As a last effort, the ground was cleared of all the dead and dying Roses last November, some manure was applied, and the soil was well stirred. Three hundred young dwarf Rose trees, all budded on the Manetti, were then planted. Their luxuriance is now quite remarkable; I never saw such beautiful growth or finer flowers. So vigorous are their young shoots that they will to a certainty (as they are nearly all Hybrid Perpetuals) give a succession of flowers till November. This for a Rose garden which has been planted barely nine months is, I think, a fact worthy recording. It is indeed great encouragement for those, and there are many, who have failed in cultivating Roses in light and exhausted soils. It is also most interesting and rare to see such beautiful Roses thus flourishing only 200 yards from the sea. *Rosa.*

Fruit crop at Honfleur, Calvados, France.—I may mention for your information, that fruit of all kinds, except Grapes, is plentiful in this neighbourhood; and apropos of your controversy with M. de Jonghe, I may add, that a friend of mine has for some years covered his fruit trees, espaliers and all, with nets, removing them when the fruit is fairly formed, and frost not likely to recur; he has found an immense advantage in this plan, his fruit being always finer and more abundant than his neighbours.' *J. T. H.*

Turning Plants White.—I have recently visited a garden in the midland district, the gardener of which seems to take a particular delight in turning everything he can lay hands on white. I particularly noticed some Balm having quite an ivory-like appearance. Can you inform me by what process this is effected? [No.] *Banbury Cross.*

Notices of Books.

Dr. Leidy's Flora and Fauna within Living Animals.—It appears from an article in the "Florist and Horticultural Journal," published in the United States, that we have inadvertently given great offence by our review of the work above mentioned. On a reperusal of that review we find it very difficult to conceive why it has been taken in such bad part, and the more especially as our object in writing it was to induce those persons who had already purchased Dr. Robin's work, which has had a very large sale in England, to add to their libraries the work of Dr. Leidy, as containing information not to be found in Robin; and we were the more desirous of recommending it, because the only remuneration, as far as we believe, which the authors of communications to the Smithsonian Institution can look to, is the sale of the copies which are placed at their disposal by the society.

The passage which is more particularly called in question stands as follows. "It may be true that it does not contain much which may not be found in Robin's second edition of his admirable work on those fungals which grow on animals; but the illustrations are in some instances far more complete, and well worth the attention of every botanist and physiologist who may chance to be interested in the subject. We would point out more especially the plates which represent the curious parasites which infest the intestines of different species of Julus, and the several entozoa which live in their company; for though the principal of them are not overlooked by Robin, there is nothing in his plates as regards these particular productions which can for a moment be compared with Dr. Leidy's copious and excellent figures." Now, what "remarkable errors" or "perversions" are contained in the above passage we cannot conceive.

There is no question whatever as to the originality of the observations of Dr. Leidy, a question altogether beyond the scope of our journal, which aims at little more in its reviews than an indication of the sources from whence trustworthy information can be obtained; and the whole tendency of the passage is to show that, on some points, Dr. Leidy's work contains information and illustrations superior to what is presented by the popular publication of Dr. Robin. We beg, too, to observe that at the time our notice was written, we had read every word of Dr. Leidy's book, and had gone through that of Dr. Robin page by page with a view to ascertain what additions had been made in his second edition. If, therefore, we have erred, it has been with our eyes open. If we had reason to believe that we had given the slightest pain to Dr. Leidy, we should at once write to him personally to express our regret; for we have received too many kindnesses from American botanists, and are in too intimate relation with several, to wish to give a moment's dissatisfaction where we have met with nothing but the most kind and honourable feeling, without a particle of captiousness or jealousy—a fact to which we have more than once borne testimony in this journal, as also to the rapid strides which every branch of botany is making in the United States; and those American botanists, such as Asa Gray, who know most of England, are well aware that such kindly feelings are universal amongst those who are most worthy of estimation for diligence and talent. Much as we admire genuine patriotism, we have no sympathy for the man of science, however great his abilities may be, who confines his powers of vision to his own horizon, and will acknowledge no merit with which he is not personally or nationally identified.

New Plants.

83. CHÆTOGASTRA LINDENIANA. *Planchon.*

"This is another of those woody Melastomads belonging to the fine and well marked group which inhabits the sterile and snowy regions (paramos) of the Columbian Andes. These alpine plants, which are remarkable for the splendour of their flowers, form the principal ornament of the high stormy places in which they are found, and are protected from the inclemencies of their natural climate by their coriaceous or velvety leaves and persistent fleshy flowers, whose corollas resist the action of frost and wind. These species from the Andes must not therefore be confounded with those with deciduous short-lived flowers found in hot and temperate climates, and which have deservedly fallen in estimation. The C. Lindeniana is a bushy shrub with hairy leaves having a rusty under surface (in their native country) and large blackish-purple flowers. It was discovered on the top of Monserrat (one of the highest peaks of the plateau of Sta. Fé de Bogota), at a height of 9840 feet. Mr. Schlim again found it in the paramos of the province of Pamplona, and thence introduced it into Europe." Price 25 fr. *Linden's Catalogue for* 1854.

If, as we suppose, a plant in our herbarium, without name, from Mr. Linden, numbered 1311, be this, it will be very near the *Chætogastra muricata* of Peru, another very fine thing found by Hartweg; but, like the rest of that collector's Peruvian and Grenada plants, never received alive in England.

84. FRAXINUS (*Ornus*) DIPETALA. *Hook. et Arn. Bot. Beech.* p. 362, t. 87.

This Ash, first described from Douglas's specimens from New California, by Hooker and Arnott, has been introduced into this country from Chihuahua, one of the northern states of Mexico, by Mr. J. Potts, and is now growing in the garden of Mr. F. Scheer, at Northfleet. It has stood the last two winters well, and may therefore be considered as perfectly hardy. Its compact, lively green foliage, its purple branches, and its elegant white flowers, render this species as great an acquisition to our gardens as the other ornamental plants, for the introduction of which we are indebted to Mr. Potts. *Berthold Seemann.*

Garden Memoranda.

HORTICULTURAL SOCIETY'S GARDEN, TURNHAM GREEN.—Since our last report the great Lælia superbiens in the curvilinear stove has thrown up three more flower spikes, which now number seven in all, being about as many as it has had on it in any previous year. As brilliant a display of flowers as usual may therefore be expected from it. Seldom have the glass houses presented a larger amount of floral beauty at this season than they now offer. In the stoves, this is kept up principally by means of Achimenes, which have been and are still beautifully in blossom; and in greenhouses such plants as Fuchsias, Calceolaria rugosa, which for autumn display is invaluable; Balsams, Japan Lilies, &c., maintain an agreeable amount of gaiety. Chrysanthemums for the conservatory are progressing most favourably, the plants being dwarf, bushy, and covered with leaves to the very pot; some early ones even promise soon to be in flower. In pits were numbers of young plants of Selago distans, which is struck in quantity every spring and grown on all the summer for the decoration of cool greenhouses and the conservatory shelves in winter, for which it has been found most valuable, its multitudes of small white flowers being much admired at that season. The magnificent Brugmansias, both white and red, which flower so beautifully in the conservatory three or four times a year, have just been close pruned, and have had their wood well painted over with a mixture of soft soap, clay, and sulphur, to keep them free of insects. Hedychium Gardnerianum, growing in the bed, is just coming into blossom, its great heads of yellow and orange flowers producing a brilliant effect. Few plants succeed better or look gayer than this in the bed of a conservatory. Camellias this year are well set with flower-buds, as is also a tree of Paulownia imperialis, which, though quite hardy, was brought in here in order to ascertain whether or not it could be made to flower after having a good roasting under glass. The result is as stated; it is now covered all over with flower buds, which will probably open next spring. Cestrum aurantiacum a week or two ago was literally one mass of blossoms; it is again well furnished with flower buds, which, when they shall have expanded, make the third time it has blossomed this year. Statice arborea planted out in the bed has bloomed much better and longer than it does in a pot—its showy blue flowers remaining good quite three months; for conservatory beds few plants could possibly be more suitable.

In the Arboretum the bedding plants are just now at their best, and altogether this department of the garden is at present very enjoyable, the Grass being short, soft, and beautifully green, while the shade of the trees keeps the turf cool for walking on. The Mexican Pinuses, which were so much injured by the winter and

spring, have recovered wonderfully, the worst of them being now nearly covered with healthy foliage. Saxe-Gothæa, which had been killed more than half way down, is pushing afresh near the root; but whether or not it will survive the ensuing winter remains to be seen. The Fitz-Roya, which was much less hurt, has made young wood pretty freely.

In the orchard department the Apple trees have been badly affected with American blight. Brushing the parts affected with a painter's brush dipped in strong vinegar (No. 24) has been tried as a remedy.

On the Peach wall there is a good sprinkling of fruit, more especially on the Bellegarde, Late Admirable, Noblesse, Barrington, and Shanghae. The latter is a handsome Peach, which in a warm season like the present is even more sugary than the Bellegarde. It however requires a roasting autumn to have it in perfection. It is melting, with a good many fibres adhering to the stone where it is very red; the skin is pale yellow, streaked and mottled on the side next the sun with delicate red. As respects season it is rather later than the Bellegarde. The good early sorts of Peaches, such as the Acton Scot and Grosse Mignonne, are now all but over. On some of the trees the fruit is encased in Halliman's Glass Fruit Protectors, which exclude wasps, and keep such fruit as drop off from falling.

Pears on walls are in good health and well set with buds for another year, and if next spring be favourable a good crop may be expected. On Beurré Rance a few good fruits are swelling well under the present warm weather, and on Glout Morceau and Duchesse d'Angoulême is also a fair average crop.

In the kitchen garden Potatoes have caught the disease, from which even the Fluke is not exempt. It must be admitted, however, that it is more so than other kinds, and that all are much less affected this season than in previous years. Onions are very badly affected by a kind of rot at the root; they have been pulled up and laid out to dry with a view to stop its progress.

FLORICULTURE.

Layering Carnations.—The operation of layering is one of some nicety, and consequently there are many who do not do it at all well. Much has been written about it; but it requires practice and patience to do it properly. The system generally followed, and the one which I find to answer best, is, after having provided an equal quantity of road dust and decayed leaves, or other vegetable soils, well mixed, and a quantity of pegs, either made of Fern, or what is better leaden ones cast in a mould, I place my pot in a wheelbarrow or on a low table, and take my seat in front. I then, with a sharp knife, remove the lower leaves close to the stem, and shorten the ends of the others; but I am not fond of cutting away too much. When all the layers are trimmed some of the compost must be put on the pot; and, having selected the joint to cut through, I place my finger at the back, to keep it steady, and gently insert the point of my knife in the centre of the stem, pushing it gently forward with the edge downward till the blade is half through; I then give the handle a slight twist, and bring the blade out below the joint on the under side, thus forming a nice tongue. The nib is then cut back to a joint, and the piece of leaf stripped off, leaving a small bud at the bottom. It is then carefully pegged down in the fine soil which had been placed on the pot. Each layer is operated on in a similar manner. When all are down, they have a little more soil put on them, but they should by no means be buried deeply. It sometimes happens that there are shoots so high as not to be conveniently brought down to the same level as the others; when this is the case, a large piece of broken pot is placed within the rim, which holds up the soil, and makes a higher surface, in which they are layered; or sometimes they will be long enough to insert in small pots placed close to the stem. After having got all the shoots down and slightly covered with soil, I place smooth flat stones, about the size of a halfpenny, over the cut of each layer. This not only prevents the soil from being washed away from that particular part, but it very much accelerates the rooting; for if the weather is hot, and the soil in other parts of the pot dry, if you examine beneath these stones, a genial moisture will be perceived; yet the pebbles absorb heat, which they slowly give out, much to the benefit of the layers. I must here notice the operation of piping; and though the Carnation is much more difficult to root than the Pink, yet I have adopted it with tolerable success; the great matter is to do them early, for they require plenty of time. I insert them in a light soil, under a north-east wall, and having watered, to settle the soil about them, when perfectly dry, they are covered with a hand-glass. They sometimes require a slight shade, and I do not remove the glass till I see they are establishing themselves, unless any damp off; in that case they are taken away. Worms sometimes prove injurious, both to pipings and to layers. When that happens a little water, in which hot lime has been slaked, should be poured over their holes. The layers must be constantly watched, and soil added now and then, but it must be with a sparing hand. They may be watered most evenings in hot weather, but it should be with water which has been exposed to the action of the sun during the day; and but little other attention will be required till they are ready to take off. If seed has been saved it should remain in the pods till next spring; about the latter end of April it may be rubbed out, and sown in shallow pans, or on a bed, covering it slightly with soil. It may remain there till the plants are about 3 inches high, when they may be planted out on a moderately rich bed. It is well not to have them too strong the first winter; but the following spring the surface of the soil may be covered with a rich compost. As the seedlings spindle, the single ones should be removed, to give the others room; and should the raiser be fortunate enough to have one which strikes his fancy, he may layer it, and adopt the same means and precautions as I have before stated. *W.*

Royal South London Floricultural Society.—The last meeting for the season took place on Wednesday last at the Surrey Zoological Gardens, and the day being fine it was well attended. Hollyhocks, in 12 spikes, were exhibited by Mr. Chater, of Saffron Walden, to whom the 1st prize was awarded. His varieties were—Eugenia, Beauty of Cheshunt, Meteor, Hon. Mrs. Ashley, Lilac Model, Walden Gem, Rosy Circle, Joan of Arc, Sulphur Queen, Pourpre de Tyre, Pow's Napoleon, and Emily. These were all very fine. Messrs. Paul and Son were 2d with Agricola, Boadicea, Emperor Louis Napoleon (Seedling), Flambeau, Queen of Denmark, Lizzy, King of Roses, Joan of Arc, Glory of Cheshunt, Yellow Model, and Metropolitan, a bright crimson seedling. As regards Dahlias, there was a very good display. In the Nurserymen's Class, of 24 blooms, Mr. Keynes, of Salisbury, was 1st, with Sir R. Whittington, Exquisite, Lilac King, Louisa Glenny, Negro, Sir C. Napier, Essex Triumph, John Keynes, Miss Caroline, Mr. Herbert, Primrose Perfection, Fearless, John Edward, Ariel, Sir F. Bathurst, Rachel Rawlings, Morning Star, Port Royal, Duchess of Kent, Miss Susan, Fanny Keynes, Duke of Wellington, Red Gauntlet, and Plantagenet. Mr. Legge, of Edmonton, was 2d. In the Amateur Class, for 24 blooms, J. Sladden, Esq., of Deal, was 1st, and J. S. Proctor, jun., Esq., 2d. In the same class for 12 blooms, Mr. Robinson, of Pimlico, was 1st. For 24 Fancies, Mr. Keynes was 1st in the Nurserymen's Class, and Mr. Robinson in that of Amateurs. Several Seedling Dahlias were exhibited, the best being Ringleader (Holmes's), which received the Society's First Class Certificate last year. Wheeler's Lord Bath is also a fine dark flower, to which a First Class Certificate was awarded. Church's James Andrews is a pretty buff-coloured flower. Pope's Omer Pacha, a ruby crimson, received a First Class Certificate. Rawlings' Miss Frampton, a good fancy variety, white and crimson, fine in shape, and good in substance, also received a First Class Certificate. Mr. Keynes furnished a good flower called Ruby Queen, which was awarded a First Class Certificate. Several others were exhibited, the best being Comet (Keynes) pale yellow and pink, slightly striped with crimson; Lady Folkestone (Keynes); Dr. Reid (Rawlings); Beauty (Rawlings); and Thunderer (Rawlings), a striking pale scarlet flower. In addition to the above there was a good show of cut flowers, Miscellaneous and other plants.

Roses: *A K.* In pruning standards, the end bud should be left under the branch, in order that the lower branches may incline downwards; and these end shoots being left two or three eyes long every time the trees are pruned, the latter soon arrive at the desired size; but when any portion of the tree wants filling up, four or five eyes may be left. As the trees advance to a large size, they require less assistance from us.

Miscellaneous.

Roses in the United States.—I have seen whole hedges of Tea Roses in South Carolina 6 feet high covered with bloom, have cut them down with the shears as I would clip Box-edgings, and have set the cuttings, without any preparation, in a trench 8 to 12 inches deep, in November; in June following they were rooted, and had reached a height of from 6 to 10 inches, and were in full bloom. At Natchez I have seen hedges of Roses in bloom in January without receiving any special attention. The Roses are the most common in the south. *Country Gentleman.*

Citrons and Oranges.—A long chapter is devoted by Professor Targioni to the Agrumi, that is, to the Oranges, Lemons, Citrons, and others belonging to the genus Citrus of the family of Aurantiaceæ. They have long been objects of great interest to the Italians, and the subject of many valuable works, being extensively cultivated for profit wherever the climate will admit of it, and for ornament or curiosity in public or private gardens in the more northern parts of the Peninsula, where they still require protection in winter. They are all of Eastern origin, and mostly introduced into Europe in comparatively modern days, but of very ancient and general cultivation in Asia. The varieties known are very numerous and difficult to reduce accurately to their species, on the limits of which botanists are much divided in opinion. Those who have bestowed the most pains in the investigation of Indian botany, and in whose judgment we should place the most confidence, have come to the conclusion that the Citron, the Orange, the Lemon, the Lime, and their numerous varieties now in circulation, are all derived from one botanical species, Citrus medica, indigenous to, and still found wild in, the mountains of East India. Others, it is true, tell us that the Citron, the Orange, and the Lime are to be found as distinct types in different valleys, even in the wild states; but these observations do not appear to have been made with that accuracy and critical caution which would be necessary in the case of trees so long and so generally cultivated. With regard to the Shaddock (Citrus decumana), it is almost universally admitted as a distinct species, although at present only known in the state of cultivation. It must be admitted also that it appears to present more constant characters than most of the others in the pubescence of its young shoots and in the size of its flowers, besides the differences in the fruit; but Dr. Buchanan Hamilton, who is of great authority on such matters, and some others, are inclined to believe that this also may have originated in the Citrus medica. This point requires much further investigation, and a better knowledge of the floras of South-eastern Asia, before we can come to any plausible conclusion. Professor Targioni gives copious details of the introduction into Tuscany and other parts of Italy, of many of the varieties there cultivated, for which we must refer to the work itself. It may suffice, for our present purpose, to extract a few notes on some of the more important race or species according as they may be considered. Among them all the earliest known was the Citron. It is not, however, that fruit nor any other Citrus, according to Professor Targioni, that we read of in the Bible, under the name of Hadar, as is asserted by some, nor yet is it anywhere alluded to by Homer. The first mention we have of it is in a comedy of Antiphanes, quoted by Athenæus, in which it is said that the seeds of the Citron had then recently been sent by the King of Persia as a present to the Greeks. Theophrastus is the first who describes it; he tells us that the fruit was not eaten, but solely prized for its odour and as a means of keeping the moths off woollen clothing. Among the Romans we find an allusion to the Citron in Virgil's Georgics, but it does not appear to have been then yet introduced into Italy, for Columella, long after Virgil's death, made no mention of it, and Pliny, in his paraphrase, as it were, of the passage of Theophrastus, adds that it had been endeavoured to transport plants of the Citron, which he calls malus medica, or malus assyria, into Italy, but without effect, as it would only grow in Media and Persia. Palladius, however, in the fifth century, gives many details of the modes of propagating and cultivating this tree, which he says he had carried on with success on his Sardinian and Neapolitan possessions. It was, therefore, in all probability, in the course of the third or fourth centuries that the Citron was introduced and established in Italy. The mass of evidence collected by Professor Targioni seems to show that Oranges were first brought from India into Arabia in the ninth century, that they were unknown in Europe, or, at any rate, in Italy in the 11th, but were shortly afterwards carried westwards by the Moors. They were in cultivation at Seville towards the end of the 12th century, and at Palermo in the 13th, and probably also in Italy, for it is said that St. Dominic planted an Orange for the convent of S. Sabina, in Rome, in the year 1200. In the course of the same 13th century, the crusaders found Citrons, Oranges, and Lemons very abundant in Palestine; and, in the following 14th, both Oranges and Lemons become common in several parts of Italy. It appears, however, that the original importation of Lemons from India into Arabia and Syria occurred about a century later than that of Oranges. The Shaddock is believed to have followed a different route in its migration into Europe. Most abundantly cultivated in, and possibly indigenous to, the south-eastern extremity of the Asiatic continent, it is said to have been carried from thence to the West Indies, and from Jamaica and Barbadoes to England early in the 18th century. It was, however, certainly previously known in Italy, for it is described and figured by Ferrari, in 1646, as having been sent from Genoa to the garden of Carlo Cadenas, near Naples. There is no record of its first introduction to Genoa, whether from the East or the West. Innumerable varieties of Citrons are cultivated at Florence, where they have ever been great favourites as objects of curiosity as much as for their flowers and fruits. Among them is a very singular one called bizzarria, raised by hybridising and cross-grafting, in which the same tree produces Oranges, Lemons, and Citrons, often on the same branch, and sometimes combined into one fruit, a curious case analogous to that of the well-known hybrid, by grafting between the Cytisus laburnum and C. purpureus. *Journal of the Horticultural Society.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c. — Hyacinths and other Dutch bulbs, if wanted to flower early, should be potted at once, so as to allow of their being well rooted before introducing them to the forcing-house. It is, moreover, advisable to procure these immediately they are to be obtained, in order to avoid having the weak bulbs; for, of course, first comers see to being best served and carry off the finest bulbs. Many persons still prefer deep pots for Dutch bulbs, but these are of very little importance; and those who, like ourselves, dislike their appearance, will find the ordinary make of pots to answer perfectly, and a little extra manure water can easily be given, to make up for the want of the extra depth, and consequently the small extra quantity of soil. The best compost for Dutch bulbs is two parts good strong mellow loam, and one part of old thoroughly decayed cow-dung, with a sprinkling of sharp clean sand, which should be well intermixed, and used in a healthy state as to moisture. Select a dry, cool, shady place on which to place the bulbs after potting, covering them with about three inches of sand, old tan, or silted ashes, to keep them cool and prevent exciting the tops until the pots get well filled with roots. Plants of the Citrus tribe, intended for flowering early in winter, should now be fully exposed to the sun, in order to get the young wood thoroughly ripened, upon which their flowering early and abundantly will altogether depend. We prefer the variety known as the Mandarin for this purpose, as it is a free grower with a comparatively dwarf, bushy habit, and small foliage; but any of the varieties will bloom profusely if the wood is well ripened in autumn. These, with sweet Indian Daphne, are invaluable for winter decoration, and should be largely grown for this purpose. Some of the Daphnes, which are well set for flower, may now be placed in a warm part of the greenhouse, where they will soon begin to exhale their delicious fragrance. Provision should be made at once for protecting valuable, or, indeed, all hard-wooded plants, from heavy rains; for the present fine weather cannot be expected to last long, and may soon be succeeded by drenching rains, and it will, at all events, be advisable to be prepared for the worst.

Those, however, who can afford their plants proper accommodation under glass will not need to provide any temporary contrivances, but the plants will be better out of doors until there is absolute danger of frost, than crowded together in the houses. Skeleton pits with a waterproof covering to throw over them when necessary, form the best means of sheltering hard-wooded plants in autumn; for the plants should be freely exposed to light and air, and these are not expensive, and come in very useful in spring for bedding out stock STOVE.—Some judgment and care are necessary here at this season, especially where there is but one house for the accommodation of the whole of the tropical plants; for some things grow more freely in autumn than at any other season, and these should be encouraged with a moist warm atmosphere, while others that have made their season's growth require to be kept comparatively dry and cool. Very much may be done, however, to overcome these difficulties by a proper arrangement of the plants, placing those that have made their growth by themselves at one end of the house, where air should be admitted in sufficient quantities to prevent any attempt at a second growth; while the other end of the house containing the portion of the plants in active growth may be kept very much closer and moister. The Thyrsacanthus rutilans and Conoclinium ianthimum, which are two fine things for winter blooming, should be encouraged with plenty of pot-room, &c., particularly the latter, which is a free growing plant at this season, although somewhat shy in summer unless placed in a shady situation. Keep the plants clear of insects by smoking as frequently as may be necessary; and if leisure offers, look over the Ixoras, &c., for scale, and well clean their foliage by means of a sponge and soapy water.

FORCING DEPARTMENT.

PINERY.—Where the pot system of cultivation is practised, any of the stock that may be considered likely to want repotting this autumn should be examined at once, and shifted if necessary; for repotting should not be put off until the plants cannot be safely encouraged to make free growth, and strike their roots into the fresh soil before winter; and any necessary arrangements amongst plants growing in the open bed may also now be made without any danger of throwing them into fruit, especially if cloudy weather occurs, and if otherwise, shading can be used for a few hours in the middle of the day, to ward off the drying effects of the bright sunshine; therefore if any of the plants require to be removed this should be done without any unnecessary loss of time, so as to allow of their getting established after shifting, before the weather necessitates the use of much fire-heat. Encourage those expected to show fruit next January to make free growth, and remember that they should be sufficiently advanced to allow of keeping them rather cool and dry by the middle or end of next month. Plants wished to show fruit now should be assisted with a little extra heat if they are backward, and see that the soil about their roots is in a properly moist state, as the plants cannot be expected to show fruit unless this is the case, and some persons fear to apply water freely to plants that have been kept dry to check their growth, until the fruit is perceptible. This is an error, however, and only tends to injure the roots and waste time. If artificial treatment must be resorted to in order to induce the plants to show fruit, there is no method so certain and so little injurious to the plants as keeping them cool and dry for a month or so, and exposing them to as much sunshine as the foliage will bear without scorching, and then placing them in a brisk bottom-heat, with a moist growing atmosphere, taking care to thoroughly moisten the soil. Take off and pot, or plant out, suckers at short intervals as they can be obtained, for there is no more certain method of securing a steady supply of fruit than by having a regular succession of young plants. Attend well to the watering of stock in small pots, otherwise the bright sunshine with which we are now being favoured may cause many of these to fruit prematurely. VINERIES.—While the present glorious weather continues give air freely to ripening fruit, using very little fire-heat. Keep houses in which the fruit is ripe as cool as possible, in order to prevent the berries losing their plumpness; and if any covering has been applied to the border of this house, to throw off the late heavy rains, it will be advisable to remove this, lightening up the surface of the border slightly, to promote evaporation; for the borders can hardly be too dry where the fruit is ripe and expected to hang for some time, but every possible precaution should be used to avoid exposing the border to a heavy fall of rain, which at this season of the year may be expected any time. Where a covering of warm manure has been applied over the roots of recently planted Vines this will require to be carefully watched to prevent its getting too hot, or fermentation taking place in the soil. Keep a sharp look out for red spider, and if it appears where the syringe or engine cannot be used lose no time in painting the heating apparatus with sulphur, which, although a very inefficient remedy, is the best we can recommend where water cannot be used. PEACHES.—Give abundance of air both day and night, in order to get the wood well ripened while the weather is favourable. Keep the atmosphere and border as dry as possible, but if red spider is at all troublesome, which, owing to the sudden change of the weather is not unlikely, give the trees a good washing with the engine, for a little excess of moisture will be of little consequence compared with the mischief which red spider will do if allowed its own way for a week or two of bright weather.

FLOWER GARDEN AND SHRUBBERIES.

Get cuttings potted off into their winter pots as soon as they are sufficiently rooted to bear handling, and keep them rather close and warm until fairly established, after which they cannot be too freely exposed to light and air. Proceed with the work of propagation until there is an ample stock, for although we do not subscribe to the old doctrine, "that bedding out plants to be of any use before autumn the following season, must be propagated before winter," we, nevertheless, like to make sure of having plenty of strong cuttings early in March. But with proper convenience for growing the plants in spring and propagating, there is no propriety in wintering above one-fourth of the quantity of anything that will be wanted at planting out time, and such things as the dwarf Lobelias and Ageratums, &c., grow so freely, and are so rapidly increased in spring, that there is no necessity for wintering more than a few old plants, which will afford endless cuttings in spring, which will form equally fine plants as those propagated in autumn. Plant out Stocks, &c., where they are to bloom as soon as showery weather occurs. Sow Californian annuals in the reserve ground, for transplanting, to afford an early display, for which they are exceedingly useful. Persevere with mowing, cleaning, &c., and while the flower garden is in full beauty, endeavour to heighten the effect as much as possible by having everything in and around it in perfect keeping.

FLORISTS' FLOWERS.

During this splendid weather do not let either Dahlias or Hollyhocks suffer from want of water; propagate the latter by cuttings of the side shoots, remove the faded flowers at the lower part of the spike, and should seed not be wanted pluck it also. They may also be propagated by taking buds and inserting them in light sandy soil in thumb pots. Care must be taken not to give them too much water, as they are apt to rot off, and it will be requisite to keep them closely covered down in a cold frame. Layering Carnations and Picotees should be completed as speedily as possible; examine the seed pods, and cut off the upper part of the capsules, to expose them more to the action of the sun. Watering the layers with a fine-rosed watering-can in the evening, with water which has been exposed to the action of the sun during the day, will materially aid the development of roots. Continue to propagate Pansies by side shoots; they root very freely now. Seed of Tulips should now be gathered; of course care has been taken that none but pure flowers have been saved from. The amateur may purchase good varieties at a moderately low price now, for amateurs are making up their beds, and have often surplus stock to dispose of at a reasonable rate; at all times it is advisable to give a good price for a good strain, rather than have a bad one for nothing. Prepare the bed for offsets, and a turning over will sweeten the main bed; this should not be lost sight of. Attend to other departments as previously advised.

HARDY FRUIT AND KITCHEN GARDEN.

Take advantage of the present dry state of the ground to get Celery earthed up, first thoroughly soaking the lines with manure water, also apply quicklime where slugs are troublesome. On heavy soils it is sometimes necessary to surround the plants with sand or sifted ashes to prevent their rotting off in winter, which they are apt to do if surrounded with soil that holds much water. Where anything of this kind is necessary it will be advisable to defer earthing up till later in the season, as frequent soilings of this sort would be very troublesome. Also pull Onions where ripe, and get them dried while the weather is favourable. Thin young crops of Turnips, Spinach, &c., before they become weakly and drawn, through standing too closely together. Stir the surface of the soil deeply among growing crops, to admit air to the roots, and keep down weeds. Let nothing suffer for want of water, especially recently planted Strawberries; these will be benefited by liberal applications of manure-water. Get spare ground manured and dug or trenched, in readiness for another crop whenever time can be spared for this kind of work.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Sept. 7, 1854, as observed at the Horticultural Gardens.

Sept.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth 1 foot deep.	2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 12th, 1841—therm. 84 deg.; and the lowest on the 12th, 1848—therm. 31 deg.

Notices to Correspondents.

BIRD-STUFFING: *T W P.* Any book on what is called Taxidermy will give you, for a few pence, the information you desire, and with all the details which the subject requires, but for which we could not possibly find room.

BOOKS: *Assa. Fœtida.* Pereira's "Materia Medica," and Lindley's "Flora Medica."—*D T.* Hoppus, for timber measurement, and Dix, for land surveying.‡

COTONEASTERS: *J T H.* These are all shrubs. That called *C. microphylla* is a dwarf small-leaved evergreen, from the Himalaya mountains, and an extremely pretty plant. It is now very common in English nurseries, but has no English name.

DISEASES: *T C.* Your Grapes are not all affected in the same way. The Frontignan exhibits merely an aggravated form of rust. The Assyrian presents a sample of the Grape-rot, which is prevalent in almost every part of England, and which certainly is aggravated by dampness of soil, though we have seen cases where, as in your own specimens, the canes were of enormous length and strength, and the ground apparently well drained, and yet every bunch more or less diseased. The Alicant is differently affected from the others, the disease consisting of a thickening of the cuticle in round distinct spots, which we have never before witnessed. The presence of Ferns is scarcely consistent with the health of the Vines. To keep the Ferns in beauty the atmosphere must be too moist for the Vines, and if your Grapes are healthy where there are no Ferns, the disease probably arises from that source. Excellent Grapes, indeed, are often produced where Peaches, Nectarines, and Apricots are cultivated but where Ferns are added the chances of disease are immensely multiplied.—*A North Briton.* Your Grapes and their leaves are affected nearly in the same way with multitudes which we have received from the North and South of England, and others which we have ourselves examined. The only difference is that in your case the rot arises from a rusty spot which gradually spreads without becoming depressed. The affection of the leaves, however, is so similar that it is evidently a mere variety. We have great doubts about the sulphur doing good, as there is no fungus. Either the state of the roots, after all, is not good, perhaps, as you indicate, from the use of stable dung, or the peculiar season is in fault. If the latter be the case, you can, of course, do nothing, but if the former, you will easily find a remedy.—*H N.* Yours is a less aggravated case of the disease which is so prevalent amongst Vines, for happily the leaves only are affected, or at least the produce has not rotted. By all means ascertain that the roots are not subject to strong alternations of drought and moisture, and that the soil is not sodden. If you neglect to examine their condition now, the disease may be more fatal next year.—*J C.* The Vine root which you have sent is mouldy and decomposed. Whether designedly or not it has evidently penetrated into raw manure, as is manifest from the grains of Barley, particles of dung, &c., which are attached to it, or through which it has made its way. Vines do not like gross manure, either in gardens or vineyards, and either the plant or produce is sure to suffer from its presence.—*T F.* The spots on the Camellia leaves do not arise from fungi. They are probably due to some defect of drainage, or to the pots in which they are grown not being sufficiently porous. Examine the state of the roots, at all events. *M J B.*

FRUIT TREES FOR A NORTH WALL: *Fife.* Apples: 2 Ribston Pippin, 2 Blenheim Pippin, Early Harvest, Wormsley Pippin, Pearson's Plate, Pitmaston Nonpareil. Pears: 2 Jargonelle, Knight's Monarch, Broom Park, Suffolk Thorn, Autumn Bergamot. Cherries: 3 Morello, 2 Kentish, 2 May Duke. Plums: Royale Hâtive, 2 Jefferson, 2 Early Orleans, Shropshire Damson.‖

INSECTS: *F D.* For want of their ordinary food (aphides), the lady-birds (coccinellidæ), especially the smaller kinds, will attack wall fruit, eating small holes through the skin and lodging within.—*W B.* The insect known in the Highlands under the name of the "serpent's-bill," and elsewhere as the "adder-bolt," is the commonest species of dragon-fly, Gomphus vulgatissimus, occurring, we believe, all over the kingdom.—*M G.* The Onion maggot is the well-known larva of a fly (Anthomyia Ceparum) very much like the domestic fly. It abounds most in dry hot seasons, and may be best checked by pulling up the plants as soon as they appear to droop, and picking out and destroying the grubs. This will prevent the attacks of future generations, which otherwise occur with great rapidity at this season. *W.*

MATERIAL FOR PAPER. A question is asked in the number of this Journal for September 2, 1854, whether Hop bine may not answer this purpose. The same question was asked by ourselves, a few days since, of Dr. Plomley, who is a successful cultivator of Hops, and his reply was, that the only manure he used is the bine, cut up by a machine after the fashion of chaff, and dug in between the rows. For land less rich in phosphates other manure may be necessary; but so long as the bine is beneficial when returned to the soil, its probable value as a material for paper will not be sufficiently great to admit of the purchase of artificial manure to replace the loss. *M. J. B.*

MEALY BUG: *A M.* The only mode of getting rid of this pest, is continual brushing, sponging, and washing, with a mixture of tobacco water and soft soap

NAMES OF FRUITS: *Sub.* Probably the Black Prince and Royal Muscadine; but it is impossible to determine with absolute certainty from the fruit alone.‖

NAMES OF PLANTS: We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We annot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J D.* Plants out of flower cannot be named. —*A L.* 1, Lastrea spinulosa, barren frond; 2, Ditto, fertile frond. *S.*—*Grantham.* Colchicum autumnale.—*E L A.* G. Gandavensis, one of the many mules obtained between G. psittacinus and others.‡—*M K.* Pteris serrulata, a native of the East Indies, and a weed in most hothouses. In your case the spores (seeds) no doubt came with the Orchids; you will soon have abundance of it. *S.*—*J W & Co.* Epidendrum floribundum.

POTATOES: *H M.* We will endeavour to learn what your sort is, and tell you next week. It is of good quality, but the tubers you have sent are in some cases diseased.

SYRINGING: *G N.* An answer to your remarks will occupy more space than we can spare to-day. You shall have a full reply next week. You seem to misunderstand the article to which you refer.

TENANCY: *F S.* You should never ask advice upon points of law except of lawyers. The question you put is very insufficiently explained; all we can say is—1, That you must quit with six months' notice from the end of your year; 2, That you ought not to go on cropping; and 3, That the law does not entitle you to be paid for anything that is not specially agreed for. You had better consult a solicitor.

THE MOON PLANT: *A W.* It is Calyniction speciosum, a kind of night-flowering Convolvulus, with large white blossoms. It is not common, because it is not a favourite, and takes up too much room, but is handsome and very well known.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

UPPER PERUVIAN GUANO ON SALE.—Apply to W. & J. RAVENSCROFT & Co., Liverpool.
Extract from a Report of Dr. Ure, F.R.S., &c.
"Your Upper Peruvian Guano is worthy of all commendation"
Extract from the Report of George Layton, Esq.
"RAVENSCROFT'S Upper Peruvian Guano will last longer, and eventually do more good than Gibbs', or any other I have ever tried. It possesses the very finest qualities of both Guano and Bone Dust."

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PEAT CHARCOAL.—The undersigned have a cargo of this valuable Deodoriser and fixer of Ammoniacal matter, on Sale. Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

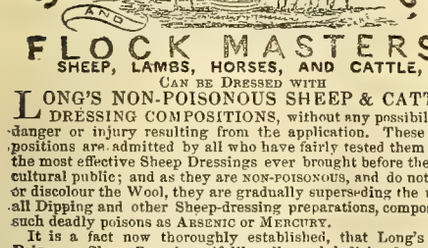
THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only: and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

IMPORTANT TO



FLOCK MASTERS.
SHEEP, LAMBS, HORSES, AND CATTLE,
CAN BE DRESSED WITH
LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.
It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.
Pamphlets containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of
BARRY BROTHERS, AGENTS FOR JOSEPH LONG,
Meriton's Wharf, and Shad Thames, London.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

WEDLAKE'S OAT-CRUSHERS, CHAFF-CUTTERS, CARTS, HARROWS, PLOUGHS, and FLOUR MILLS.—118, Fenchurch Street, London.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

BALANCE OF FACTS IN FAVOUR OF RICHMOND AND CHANDLER, who have, in competition with the best selected CHAFF CUTTERS of the most celebrated makers in the trade, carried off the highest prizes against all comers.
COPY OF TESTIMONIAL.
"Early Court, Reading.
"GENTLEMEN,—I beg to hand you a cheque for your Corn Crusher; I must add, at the same time, that nothing can exceed the goodness of the Machine. I have found in it all I can wish, and, moreover, a very superior finished Machine, and a pattern for other makers. (Signed) "GEO. SHACKELL."
"Messrs. RICHMOND & Co."
Address.—RICHMOND & CHANDLER, Manchester; and South John Street, Liverpool.

REAPING AND MOWING MACHINES.—CAUTION.—Notice is hereby given, that any person or persons infringing any of the Patents of Cyrus Hall M'Cormick, for Reaping and Mowing Machines, or making, or vending, or using, or exercising any Machines which in any way infringe upon any such Patents, will be proceeded against according to law. The more prominent features of M'Cormick's Patents consist in a serrated cutting blade, spear-head shaped holding fingers, and a gathering reel.
E. J. & H. LAWFORD, Mr. M'Cormick's Solicitors.
Draper's Hall, 27 Throgmorton Street, London, Sept. 2.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

LONG SUTTON RAM SHOW.
LETTING AND SALE OF RAMS.
MR. JOHN CLARKE has the pleasure to inform the Breeders of Sheep that his next ANNUAL SHOW OF RAMS will take place on Wednesday, the 13th day of SEPTEMBER, when the favour of their company will be highly esteemed. About 120 will be Shown, the half of which number, owing to the wishes of distant friends, will be offered for SALE. They will be Penned at 12 o'clock. Luncheon from 1 to half-past 2 o'clock. Letting by Auction immediately afterwards. Arrangement will be made to meet the Wisbech 12 and 12.40 down and the 7.5 up-trains, and also the Spalding 11.45 and 12.23 morning and the 8.5 evening trains.—Long Sutton, Lincolnshire, Sept. 9.

THE BIRMINGHAM POULTRY SHOW, 1854.—In addition to the Prizes enumerated in the List issued on the 23d of February last, the General Purposes Committee of the Council have resolved to offer First Prizes of 2*l.*, and Second Prizes of 1*l.*, for SINGLE COCK BIRDS, of any age, of all the following varieties, namely:—Dorking, Spanish, Cochin China, Bramah Pootra, Pencilled Hamburgh, Spangled Hamburgh, Game, and Polish; and that the same shall be entered under Letters A to H on the ordinary Certificate.
JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham, Sept. 9.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 9, 1854.

MEETINGS FOR THE ENSUING WEEK
THURSDAY, Sept. 14—Agricultural Imp. Society of Ireland.

AMONG the recent additions to the cultivated plants of British agriculture, probably none exceeds in importance the Trifolium incarnatum, or Italian Clover. And as the present is its proper seed time, the following particulars regarding its cultivation and value as a forage plant, given from personal experience, may possibly be read with some interest

It has now become one of the most valuable of all green crops usually cultivated for early spring food; and whether it is used for soiling cattle in their stalls or for the folding of sheep in the open field, there is no sort of green crop which will afford so heavy a crop of the most nutritious food.

It is worthy of remark, also, that this crop furnishes one of the safest kinds of green food which can be obtained—the cattle and sheep whilst feeding on it being generally remarkably healthy, and much less subject to scouring and other disorders incidental to the use of early spring crops in general. The cultivation is far more difficult than that of other sorts of Clover, or green crops in general, in proof of which, for some years after its first introduction, it got in disfavour with a large majority of farmers, and its cultivation was well-nigh abandoned. Some few, however, who knew how to cultivate the crop, were very successful, obtaining immense crops year after year. By them it was appreciated; and from perseverance in its culture, it has at length become a favourite kind of early spring food, is justly appreciated, and not likely to recede in general estimation until some more valuable crop can be discovered to supersede it.

The time of sowing is of more consequence in the growth of Trifolium than that of almost any crop under cultivation. In Belgium and other continental states it is sown as early as the last week in July or the first week in August; and we have noticed the best crops produced in this country have been sown at the earliest period. It generally succeeds well when sown after a crop of Tares which have been fed on the land by sheep; but it will also do well sown after winter Oats, Rye, Wheat, or other grain, provided it be sown as soon as the crop of corn is removed.

The land should not be ploughed previously to sowing, for although we have known good crops grown after ploughing, it is quite the exception; and the best rule in its cultivation will be found to be to sow the seed upon the stubble, or bare ground, and then to work the land with the drags or harrows sufficient to produce a good tilth and bury the seed, leaving the land rolled.

The only insect enemy from which the crop suffers is a small white slug, and it is the more desirable to sow early in order to avoid its depredations, which are always most destructive late in the season, when the sun has less power and the nights become lengthened.

The soil best adapted for the growth of Trifolium is a good sandy or clay loam, yet excellent crops may be grown upon almost all kinds of land in good condition. The quantity of seed sown per acre should never be less than 20 lbs., and, in case the time of sowing is delayed beyond the usual period, 25 lbs. or 30 lbs. per acre will be no more than sufficient.

Trifolium seed being nominally cheap, not more than 4*d.* or 5*d.* per pound, although a large quantity of seed is necessary, yet the acreable cost is not great, being much less than the cost of seeding for most other green crops. This crop, when fed upon the land and managed in a proper manner, is certainly the best preparatory green crop with which we are acquainted. Swedish Turnips, as well as other varieties, generally take well after this crop; for not only does it furnish a large bulk of food for the consumption of stock, which will return a proportionate quantity of manure, but the land will be found in an exceedingly mellow and kind state, from the effect of the gross and luxuriant foliage peculiar to the Trifolium plant.

It must, however, be borne in mind that this crop is very short-lived, the season for feeding or soiling being limited to about a month at the farthest; it is therefore desirable not to sow a greater number of acres than can be consumed within that period, the stalks being very wiry, and showing much woody fibre, when the seed begins to form.

As a seed crop, although the produce generally sells at a low price, yet the large quantity obtained makes it a remunerative crop upon some soils. We have known it saved for seed upon some light gravel soils, and taken instead of a Wheat crop, and the return has proved very satisfactory, as compared with the crop of Wheat usually obtained upon such soils, and the crop has also been removed from the land in time for sowing Turnips.

When the seed is sown at the first season here recommended, it often becomes very gross towards the month of November; it does not, however, suffer from the effects of frost on this account, and it may sometimes be fed by sheep in the autumn, if not eaten too close; yet it is not generally so forward in the spring by a week or 10 days when thus fed; but, although it may be somewhat later in the spring from the effect of feeding, it does not diminish the bulk of the crop ultimately.

Sometimes the crop is mown for the purpose of conversion into hay; it is not, however, to be recommended as a system, but may be attempted, in case the crop proves to be more than can be consumed as green food within the usual period. It should be cut very early when intended for hay; and the risk is always very great, as a comparatively small quantity of rain will seriously damage it.

This crop will be found an excellent substitute for the broad Clover upon those soils which have become what is called Clover-sick; and we have known instances where such land had been cropped with Trifolium, on which red Clover has afterwards succeeded admirably.

IN our Number for August 1, 1846, an account was given of a curious case of blight in Wheat, which has been transferred to the article "BLIGHT" in the "Cyclopedia of Agriculture," and has therefore been very widely diffused amongst agriculturists. We have already, during the course of the present year, again adverted to the subject, in consequence of several applications for information, though we

are far from thinking that so many blighted plants have occurred this year as are usually to be found in Wheat crops. Such was the conclusion to which the Editor of this journal arrived in the course of a late extensive journey through England and Scotland, and his report is borne out by the observations of others. A case, however, from the neighbourhood of Stranraer is so curious and circumstantial, that it appears worthy of especial record. The blight made its appearance, shortly after the ears had shot out, in spots which gradually extended till they nearly met. Up to the time of flowering, the crop looked exceedingly well and healthy. The stems began to get yellow from the bottom upwards, the lower leaves withering prematurely, which induced me to examine the roots, where a mouldy decay had in most cases commenced. The whole stem and root now appear to be dried up and entirely destitute of sap, which will necessarily prevent the seed coming to perfection. The field is a stony red soil, resting on trap rock, sloping to the west near the sea, and at an elevation of about 200 feet above it. Within the last 12 years it has been drained, first on the shallow system, and afterwards 4 feet deep, thoroughly subsoiled and limed, and has been twice trench-ploughed 12 inches deep besides.

The following has been the course of cultivation:—

1850. Wheat, a good average crop.

1851. Swedish Turnips. Manured with farm-yard manure, dissolved bones, and guano.

1852. Wheat: an excellent crop, 6 quarters to the imperial acre on the part where the present disease is the worst, 6—8 bushels more than had ever been grown there before.

1853. Part Carrots, part Turnips: well manured with farm-yard manure, dissolved bones, and guano.

1854. Winter Wheat on the Turnip land: March sown Wheat after the Carrot, both equally affected.

The disease is confined to about 8 acres, which were originally a separate enclosure, but for the last 10 years have formed part of a field of 30 acres in extent. Now the above account agrees so closely with that before recorded in the *Agricultural Gazette*, that it is difficult not to believe the diseases identical, though what is commonly called blight may arise from several causes. The radiation from distinct centres of growth, and the constant presence of mycelium about the roots, indicate at least that the spawn of some fungus in this case has been the principal agent; but whether spreading from a plant or plants, unhealthy from some other cause, or being previously present in the soil and actually causing disease, is uncertain. Nor as regards the practical view of the question is it very important. It is well known that the similar progress of the Rhizostonia—which is so destructive to Asparagus and many kinds of agricultural produce, as Carrots, Mangold Wurzel, Potatoes, Lucerne, Madder, Saffron, &c.,—may be arrested by insolating the plants which first exhibit traces of disease, and it is very probable that if the same course were taken in land subject to the kind of blight above mentioned, it would be attended with success. It is only in land subject to serious attacks that we should recommend such a practice, and where the disease has been observed to spread from different centres. In ordinary cases the attack is confined to individual plants, and is often entirely independent of the agency of fungals, being purely constitutional. In such cases no remedy whatever can be applied. How far it may be wise to cultivate Wheat every alternate year, without any other cereal intervening, may perhaps admit of question.

M. J. B.

ROYAL AGRICULTURAL COLLEGE.

SESSIONAL EXAMINATION IN PRACTICAL AGRICULTURE.

June, 1854.

[4. Define a manure. Why is it not necessary unless in a long-settled, well-peopled, and civilised country? What principles should guide us in the choosing between farm-yard or artificial manure for a particular field? Enumerate some of the best known artificial manures. Which is the best according to the experiments tried on the R. A. College farm?]

4. A manure is any substance or fertilising material applied to or incorporated with cultivated land with a view to increase its productive properties, both as regards, first, its acting as a certain stimulus upon plants, as particularly seen in the case of the powerful top-dressings, nitrate of soda, &c.; and 2dly, as affording a source of direct food to the plants. In Australia, and certain countries where land (of a virgin soil) can be obtained at a mere nominal price, or even by inclosure alone, it does not pay the owner of such land to apply such fertilising constituents to his exhausted land; inasmuch as land in a productive state, which has never been exhausted by any such crops, can be so easily obtained, though it may require much management to render it available for growing the crops he requires, still it is cheaper, at least in the majority of cases, to enclose new land; but on the contrary, where the district is thickly populated and all the produce of the land sells at a high price, and land is proportionately dear, it would never answer to leave exhausted land and buy in fresh; in fact fresh cannot be obtained here, therefore it becomes necessary for the farmer to employ such means as shall render his land somewhat productive, and this can be done by the application of manures, of different descriptions, most suitable for the land and the intended crop—the object of the farmer, however, being to obtain a certain sort of produce economically as shall pay for the expense of applying such manures, and, of course, somewhat remunerate him in the end. The relative value of farm-yard manure and artificials depends on a great variety of circumstances, as regards the following points:—

1st. The nature of the land as requiring simply a certain stimulus, and not as requiring any great alteration of its nature.

2d. As regards the intended crop to be sown—thus, where farm-yard or highly nitrogenised manure is most valuable, as applied to a Wheat crop, and alkalies are about equally important to a Turnip crop, and here a dressing of bone-ash or dust, or dissolved bones pays better.

3d. On the distance of the field to be manured from the homestead—as, if near, the cartage of the farm-yard manure is not so great; whilst, if a great distance, it cannot be economically applied, and an artificial applied pays much better.

So that under these and many other circumstances, the relative value of farm-yard compared with artificials is materially different; for where a certain crop is desired, the manure adapted to that most economically should of course be applied. As regards some of the best artificial manures:—The value of a manure, as already remarked, varies according to the crop which the farmer wishes to raise. Thus, a highly nitrogenised manure, as guano, at 10*l.* per ton, is cheaper than superphosphate at 7*l.* for application to a Wheat crop; yet the superphosphate at 10*l.* is as cheap as the guano at 10*l.*, as regards its application to a root crop. Among the valuable are—Guano, Peruvian, Bolivian, and certain stimulants, as nitrate of soda, flesh manures, and all highly nitrogenised substances, for grain crops. Superphosphate, dissolved bones, bone ash, half-inch bones, and all home manures, for the raising of a Turnip crop, Mangolds, &c. Beside these, there are certain others more useful for mixing with the land than for any decided manuring action, as gypsum, which are only useful under some circumstances. The manure which paid best on the Royal Agricultural College Farm, as regards the experiment in the Swedes in No. 1, was, undoubtedly, the bone phosphate, which, though less in bulk, yet raised a considerably greater amount of Turnips than either of the others, and yet this must not be considered as the most valuable article for general purposes, but only for the root crops; for if Wheat had been sown instead, the greatest amount of grain would have been realised, most likely, by some other.

[5. What are the relative advantages and disadvantages of applying farm-yard manure in a fresh and in a highly decomposed state?]

5. The relative advantages and disadvantages of applying farm-yard manure in a fresh or highly decomposed state are very numerous. In the first place, farm-yard manure on decomposing gives off its most valuable constituents in the form of ammonia, and necessarily, therefore, a great amount of its fertilising substances is lost; but still, taking a given weight of fresh and highly fermented manure, the amount of ammonia, pound for pound, in the latter is much greater, showing that the loss of ammonia is not in equal ratio to the loss in bulk. The following shows:—

Fresh manure	...	100 cwt. contain	40 lbs.	ammonia
After a time...	...	80 "	35	"
"	...	60 "	30	"
"	...	40 "	20	"

Showing that while in fresh manure 100 cwt. contain 40 lbs. of ammonia, *i. e.*, less than half, 40 cwt. of highly fermented contain quite half that weight of ammonia; and, therefore, a pound of fresh is not worth so much as a pound of highly fermented by some considerable amount. Though fermentation results in the dissipation of ammonia, yet under certain circumstances the highly fermented manure is much more valuable, as in cases where the immediate action is required; and thus the manure in a certain stage of fermentation imparts its action at once to the crop. Yet, on the other hand, when winter manuring is carried out, the application of fresh manure is far more advantageous, as the parts which are dissipated are greatly kept in the soil, particularly in the case of clay soils. It follows that a medium is far the best for ordinary purposes; thus, it is far from judicious to let manure ferment till it has lost all heat, and then cart it with a view of its imparting an immediate action; good fresh manure is better even for immediate action than rotten manure, which has lost the most of its fertilising constituents, and is quite cold.

[7 What are the three principal component parts of milk? Describe briefly the process of making butter and cheese, and specify the share therein which is taken by these parts respectively.]

7. The three principal component parts of milk are the cream, consisting of fatty globules enclosed in a case of caseine or cheesy material, and which, on breaking up, form fresh butter; curd, the portion which coagulates on addition of an acid or rennet; and whey, the remaining portion usually consumed by pigs, calves, &c. The process of making butter consists in breaking up the case of caseine, and allowing the fatty matters to come together. The butter is made from the milk in several states. 1st, milk, cream, &c., altogether, by which means the greatest amount is obtained, but which is of an inferior quality to the butter made from—2d, the cream alone: the cream may be either in a sweet state, which, of course, makes the sweetest butter, or it may be allowed to turn sour, or it may be clotted, either of which has certain peculiar differences. The first system of churning the whole is carried out in Ayrshire and in large dairies; but, on a smaller scale, when quality is the grand point, and it is not required to keep so long, the other means are of course preferable. The cheese is obtained by coagulating the milk by means of an acid, mostly rennet is used (which consists of the inside of a calf's stomach, prepared, salted, and dried, and packed in jars ready for use). The rennet solution is best prepared by boiling a portion of the mass in the water, and letting it stand 24 hours, when the clear solution is sufficiently acid to coagulate the milk; one half pint sufficient to 50 gallons of milk. The curd thus coagulated is taken out, squeezed, exposed to a medium temperature, well salted, and placed in vats, in which it is pressed down, left at a medium temperature till it becomes mellow. Certain peculiarities in making it influence the cheese as soft or hard, and thus as well adapted for keeping or not.

[8. Describe the artificial pasture crops usually sown on arable land, with any of their peculiarities which you may remember.]

8. The artificial pasture crops in general use consist chiefly of the following varieties of Trifolium.

1. The Trifolium pratense, broad-leaved or red Clover, yields a great amount of good hay, if the weather is favourable, but inasmuch as it is very succulent, it is liable to be injured much by the action of wet, and therefore by itself is not sown to advantage; it is not so sure of forming a good sward, and hence cannot be entirely depended upon. It is, however, highly nutritive, and grows well on good deep rich loamy soils, though it yields but a poor crop on the poorer lands.

2. The Trifolium pratense perenne is a variety of the red, being somewhat perennial, and easily known as the Cow-grass, partakes of somewhat the same characters as the red Clover; it yields a great supply of hay on good rich soils, but as it is very succulent it requires good warm weather for making it, and it is liable to be decayed by wet. It, like the former, is not so sure of forming a sward, though if anything it is more so than the former: it is not, however, on the whole so nutritious. The Trifolium repens, little white or Dutch Clover, is advantageously sown in the alternate husbandry, combined with others. Though a small plant, yet it grows very thick at the bottom, forming a rich bottom sward. It is highly nutritious, and makes good hay. It has the advantage of growing on nearly all soils, and is a plant by which the farmer can always insure some crop, as by its fibrous roots it can stand the excess of wet, or *vice versâ*, equally well, and is well adapted as a portion of a mixture on all soils. The Medicago lupulina, or common Trefoil (Hop Trefoil), differs from the true Trefoil in the pod. It, like the Dutch Clover, will grow on nearly all soils, yielding a somewhat remunerative crop under all circumstances, and therefore should always be sown. The Sainfoin, a plant belonging to Leguminosæ, is particularly adapted for soils rich in lime, and by its long roots penetrates the ground to a great depth in amongst the fissures of the rock, extracting food from places that few or no other plants could reach. It is highly nutritious, and sown occasionally on the Cotswold Hills as a means of resting the land. It is sown alone generally, and left down for some two or three or ten years, as it thrives. It is usually in its prime about the third or fourth year, and after that period dwindles off. It will not grow on soils deficient in lime, and is only of importance on such soils as ours. The Grasses sown on the Royal Agricultural College Farm this season, are chiefly mixtures of three—Red Clover, Dutch (Cow Grass), Trefoil, and Rye Grass, in No. 1, 10 lbs. of Red Clover, 6 lbs. of Trefoil, half a bushel Rye Grass, &c.

THE PORK MANUFACTURE OF AMERICA.

This industry appears to have originated in, and indeed is still confined to the Western States, where the natural luxuriance of the soil yielded a return far greater than sufficed the wants of its occupiers. Situated at a vast distance from the populous centres of commerce and manufactures, and being beyond the range of demand for foreign markets, owing to the then undeveloped system of railroads and water communication, the early occupiers of the soil, with a ready perception of the difficulties of their situation, and their remedy, resolved to breed hogs on a scale sufficient to enable them to convert their corn into living flesh, and thus travel it at a low cost to far distant markets. It is now some 25 to 30 years ago since this new system of farming commenced, and in the course of a few years it assumed the character of a distinct and promising industry. Cincinnati, then (1830) numbering about 25 000 inhabitants, and being the business centre of an immense corn-growing and hog-rearing district, and the most important rising city of the west, at once became the seat of the new trade. Now the "Queen City of the West" numbers upwards of 150,000 inhabitants—an increase of population largely due to the success of this new industry.

As it possesses some peculiar features in relation to agriculture, a brief sketch of it from the farm to the factory may not be without interest. The hogs are kept in numbers, great or small, according to the circumstances of the case, either as regards the possessions of the owner or the proximity of markets, at which he

could in the ordinary manner dispose of his corn. They are usually allowed to run in the woods, and to seek their food on Acorns, Beech-mast, Grass, &c., until the end of August or the beginning of September, when those intended for slaughtering are turned into the corn-fields, where they remain eating and fattening until the end of October, when they are collected and sent up to market. In cases where small lots only are kept, they are usually purchased by drovers or jobbers, who again dispose of them to the large dealers; in other cases, the farmer drives them to market himself, and deals directly with the consumer. Some of the more extensive farmers will have as many as from 800 to 1000 hogs, but from 100 to 500 is the more common average.

The age at which they are sent to market varies from 12 to 18 months, the average weight is about 200 lbs. The breeding appears to be less attended to than it deserves, some specimens are to be met with possessing those points which in this country are esteemed desirable, while the generality are very deficient in them. The season for slaughtering and packing begins in November and ends in March.

The following table shows the relative numbers slaughtered annually in Cincinnati alone, from 1830 to the present time :—

In the year	1830	60,000
"	1835	162,000
"	1840	95,000
"	1845	213,000
"	1850	401,000

This large number gives full employment to 10 slaughter-houses and about 35 establishments for curing and packing the salted provisions.

The entire operation of slaughtering and preparing the dead meat for market is conducted upon a system and a scale of magnitude with which we are totally unacquainted in this country. Each of these slaughter-houses employs about 100 hands, selected for skill, activity, and bodily strength; the packing and preparing-houses give employment to about 2500 hands also. In the best arranged slaughter-houses the hog-pens are placed at the uppermost story, which is approached by an inclined plane from the outside, up which the animals are driven. On the next floor beneath is the killing-room, into which they are packed as closely as possible, and a man walking over their backs strikes them on their heads with a small pole-axe contrived for the purpose. They are then dragged out immediately into the sticking room, where their throats are cut, and their blood collected either in tanks or receivers below, or run away direct into the river. Adjoining the sticking-room are the scalding tanks, which are of large capacity and heated by steam. In these the hogs are immersed, and when sufficiently scalded, are tossed upon a cradle on to long benches, where they are vigorously attacked by a gang of men, who speedily detach the outer cuticle with every particle of the hair and dirt. They are then lowered to another floor and suspended by the hind legs on hooks ready for the last process, that of dis-embowelling or gutting, as it is termed. This operation is rapidly performed, a good hand finishing them off at the rate of three per minute. The entrails are all preserved for "rendering."

In this state the carcase leaves the slaughter-house and passes on to the packers, whose first operation is to weigh it, and thus determine its price. It is then cut up into the various divisions suitable for the trade with a rapidity and exactness quite astonishing, and which can only be acquired by great practice. As a specimen of the amazing activity which characterises all the details of cutting, dressing, &c., it may be stated, that in one of the leading packing houses two hands in less than 13 hours cut up 850 hogs, averaging 200 lbs. weight each; two other men lifting them on to the blocks for them. All these hogs were weighed singly on the scales in the course of 11 hours. Another hand trimmed the hams, 1700 in number, as fast as they were cut off the carcase. The hogs were thus cut up and disposed of at the rate of more than one per minute.

The hams and shoulders are salted and cured in the usual manner, and form a very large and important article of commerce both in the home and foreign markets. The middle pieces are salted as pork, and are chiefly intended for the naval and commercial marine service, considerable quantities being also exported for the supply of foreign navies. The heads, the trimmings, and the leaf-lard, are laid aside and sold for manufacturing purposes, which will be described hereafter.

Such is a brief sketch of the method adopted in Cincinnati of working up the great hog crop of that portion of the United States. The practice pursued in other districts is very similar, though not upon the same commercial scale. The number of hogs slaughtered in Cincinnati in 1850-1 was 401,755, or about 80 per cent. of the whole amount of the State of Ohio, which was given at 563,645.

We must now turn to the other portions of the hog, those used in the various manufacturing processes. These comprise, 1st, the cuttings or trimmings; 2d, the heads; 3d, the entrails; 4th, the fat; and 5th, the bristles. The two first are submitted to a process of digestion termed "rendering," in steam tanks, by which all the fatty matter is speedily extracted. This is sold for various purposes, according to its quality; the remaining portions being sold to prussiate of potass and animal charcoal manufacturers.

Some of these steaming or rendering establishments are upon a very large scale: not only are the ordinary refuse portions here operated upon, but large quantities of the cut meat which has got spoilt in the curing houses; entire hogs that have been bruised or injured in any way thus, and are not suited to the packer's purpose, are all thrown in together. Indeed, in many cases, where the relative prices of the two products, flesh and lard, are in such a state as to affect the market, it is found advantageous merely to retain the hams, and to sacrifice the rest of the carcase for the sake of the lard, which is extracted from it. In one of these establishments, as many as 36,000 hogs have passed through the steaming tanks in one season, or at the rate of about 400 per day, the produce in lard amounting to nearly 3,000,000 lbs.; a large proportion of which was of the "number one" quality. The steam employed has a pressure of from 50 to 75 lbs. to the square inch. As regards the third portion, the leaf-lard is first cut out, the entrails are then washed, and the lard drawn out by handling; the small gut is reserved for sausage casings, and the larger boiled down for soap-grease, or other coarse purposes.

For manufacturing purposes there are three qualities of lard—leaf, gut, and head; in the markets for export and home consumption, it is sold in two shapes, as keg lard, and as prime barrelled lard. In the latter shape it is used extensively in the States for cooking, as a substitute for butter, and exported for the same purpose to the Havannah. It is also sent in large quantities to our markets, and those on the Continent, where it is used both for culinary and trade purposes.

The portion of the lard not sold for direct consumption as an article of food, finds a ready sale for manufacturing purposes. The most important of these is the separation of its constituent parts, the oil and the stearine: the one used largely in the adulteration of finer oils and for soap-making; the other being the substance from which candles are extensively manufactured. This separation is effected by simple pressure. The lard is placed in quantities of about 7 lbs. in coarse cotton or hair cloths, and then submitted to pressure in the ordinary way. The oil is squeezed out and runs down into suitable vessels, and the stearine remains in the form of a clear white solid cake. The best quality of lard yields the finest oil, and also the largest quantity, amounting to from 65 to 70 per cent. The second quality yields only from 40 to 50 per cent. The oil pressing is usually carried on in the winter, as the separation is more perfect at a low temperature; all the best lards are then used. In the summer, the second qualities only are used, and even then the temperature of the press-room is lowered by artificial means. The oil is submitted to a subsequent process of refining, in which it is heated up to 200°, and about 1 per cent. of alcohol added to assist its fluidity. There are upwards of 30 lard-oil manufactories in Cincinnati, on a scale of more or less importance, the larger ones working up on the average 50 to 70 tons of lard per month.

A fact worthy of notice in reference to this industry is, that while the receipts of the raw material have increased, the exports have diminished. This is an indication of the extended home consumption by manufacturers. The total production of last year, 1852-3, was 22,180,750 lbs.; exports during the year, 13,462,900 lbs.; leaving a balance for consumption of 8,720,000 lbs. In the year 1851-2 the gross production was 21,243,000 lbs.; the exports amounted to 15,364,000 lbs., leaving for home consumption, 5,879,000 lbs. This gives an increase in the consumption of the year 1852-3 of 2,841,000 lbs. In the manufactured products, lard-oil, stearine, candles, and soap, like satisfactory results may be gleaned from the trade returns. In lard-oil, the price of which averaged from 80c. to 85c., an increase over last year is shown in the exports of 6760 barrels. In candles an increase is shown of 18,072 boxes, and in soap of 9003 boxes. In neither of the latter manufactures were there any points worthy of particular notice; the processes employed were the same as those used in this country, upon a very much larger scale.

The portions of hoof and bristles of the hog are utilised to a certain extent. From the former, glue is extracted upon a small scale, and the bristles give employment to about 100 workmen in dressing and assorting them for the Atlantic markets. *Professor Wilson's Report on the New York Industrial Exhibition.*

NOTES OF AN AGRICULTURAL TOUR IN IRELAND.—By Martin Doyle.

A Munster Agricultural School and Model Farm has been recently formed in the vicinity of the Queen's College, Cork, under the following circumstances:—An unapplied surplus of the reproductive loan fund, amounting to 4400*l.*, with subscriptions and a trifling balance from the Cattle Show fund held in 1850, of 500*l.* more raised by an active committee, under the presidency of the Earl of Bandon, has led to the establishment of this Agricultural School, under the patronage of the Commissioners of National Education, who, with legal powers which the original committee could not command, have carried to a successful issue the original project to which the talents and activity of Professor Murphy of the Queen's College have mainly contributed. The farm accounts, which commence November 1850 and end March 1, 1853, are drawn up in a thoroughly business-like manner, and exhibit very satisfactory returns; for instance, on one farm of 76 cultivated acres, the crop of 1851 produced 591*l.*, and that of 1852 560*l.* + 92*l.* for live stock sold. The abstract of account on the combined farms of 186 acres, of which 95 are cultivated, 71 are in permanent pasture, and 20 waste, is as follows:—

Farm			Dr.
Two years' rent and taxes		£504	0 0
Manure and seed purchased		170	0 0
Labour and superintendence		390	0 0
Interest for two years, at 5 per cent. per annum, on 200*l.*, expended in stock and implements		20	0 0
Deterioration of implements and machinery, 10 per cent. per annum		20	0 0
Tradesmens' bills and small items		24	0 0
Balance, being profit		128	0 0

Farm			Cr
By amount received for produce of 1851	£591 0 0		
Do. do. of 1852	560 0 0		
Difference between cost and selling price of pigs, received	30 0 0		
		£1181	0
Seed and labour in preparation of crop of 1853	51 0 0		
Manure on hand	15 0 0		
One horse handed over to the Board of Education	8 10 0		
		74	10
		£1255	10

On my way to the house of a relative near Ballinhassig by railway, I was surprised to see within two miles of the city land undrained, though in a miserable condition from confined springs, and yet with a considerable fall for carrying off the water. At Ballinhassig, Mr. Molony, who has purchased a property there of 1200 acres, has effected the greatest improvements that I witnessed along the line to Bandon, and he has shown how barren looking hills and bleak vales may be converted into a smiling demesne. Excepting this gentleman's young plantations I could not distinguish any trees within a considerable range, though I know that they do exist on properties not very distant.

On my way westwards towards Dunmanway I passed through two nearly deserted villages, whose roofless houses, shattered window-frames, and desolated hearths, in the more eastern of the two especially, gave mournful evidence of the retrograde condition of a locality which, though at no period within my long recollection of improving habits, as regards the peasantry or common farmers, is now most miserable.

Considerable exertions have been made in that quarter by the Earl of Bandon and Lord Bernard to promote the culture of Flax, and a large area of land has been sown with it, and a scutch mill and Flax market have been provided. The want of decided progress is certainly not attributable to any illiberalities on the part of the two great proprietors in that part of the county, for they charge very moderate rents, and give every due encouragement to tenants. One farmer of about 100 acres of apparently good land by the river side admitted that he was charged but 10*s* an acre for it—that he did not realise much profit by it seemed to me to be the result of the great deficiency of cattle and sheep in proportion to the extent of tillage.

Associations and feelings of a personal nature led me to visit an ancient churchyard by the river side, about two miles from the more wretched village. The vestiges of the church had long since disappeared. Memorials of the famine and plague were around me. The decayed boards of coffins too lightly covered with earth; crowded unsculptured grave stones gave fearful intimation of the work of death. The river, which during the progress of centuries had been undermining the high bank on whose level summit the church had stood, at length caused a land slip, which took away the remnants of the church walls and much of the church, and at the same time the greater part of one of those tumuli whose origin has perplexed antiquarians.

To avoid prolixity, I shall only add, of my journey to the more western parts of the county of Cork, that everything looks pretty much as it did 30 or 40 years ago, but with ruined villages, and solitary huts yet uncleared from the soil; the village of Glandore on one side of a very pretty bay, alone showing the march of decided progress in taste and civilisation. The workhouse of Skibbereen, a locality which suffered so intensely from famine and fever, is one of the best managed in the county as to diet, and in every respect. The statistics of the mortality in that parish are fearful—1500 died, being two in seven of the population.

There were 1560 paupers in the Union when I entered it, of whom 512 were in hospital, and the number had decreased within a month very considerably in the south-west of the county of Cork. Agriculture, whether by the sea-coast or inland, has not I fear advanced much among the common farmers (the gentry and large tenant farmers have improved in tillage, and the breeding of cattle and sheep every where) since the publication in 1810 of the statistical survey of the county by the late Rev. Horace Townsend.

The richness of soil, the capabilities of the highest agricultural improvements, the evident progress in husbandry, and social improvements generally, which I perceived about Carrick, on the way to Waterford, and finally, after a dreary drive through a great part of the county of Wexford, until I approached the almost entirely English environs of Wexford and Enniscorthy, contrasted very strikingly in my mind with the many bleak neglected tracts that I had traversed.

I shall end with some notes on the workhouse of Enniscorthy, which is one of those with which a model industrial farm is combined. Omitting the statistics of the inner department, regarding numbers and diet, which is in the general principles similar to those given in other unions, excepting that vegetable soup (of oatmeal, rice flour, Leeks, Onions, Parsnips, Carrots, &c.) is given in abundant quantities at dinner, with 12 ozs. of

the best white bread to the able-bodied of both sexes, and the same allowance of bread, with a pint of sweet milk to the infirm, I shall describe the farm management.

There are 40 acres which were under pasture, as town parks for cow feeding, when possession of it was obtained at per (statute) acre. The land required draining in the first instance, and the removal of many old fences, besides subsoiling, all which operations have been effected. It was first broken for Flax, for which lea is very suitable, and produced good crops. Twenty-four cows were purchased, with the intention of supplying the inmates with milk, and the economy that resulted from this management was very marked; but unhappily pleuro-pneumonia attacked the cows, of which 12 died in 1852, causing a direct loss of 128*l.* The remaining stock was sold off, and since that time all the farm produce is either sold in the market or consumed in the house. The farm is cultivated under the superintendence of Mr. Hawkins, the agricultural master, in whom the guardians have found an able and faithful officer, on the half garden and half farm system. Last year the allotments were 6 acres of Flax; 12 of Mangold Wurzel; 8 of Turnips; 4 of Carrots; 2 of Parsnips. The remainder under Onions, Leeks, and Cabbages. One acre of the Mangold Wurzel was planted out for seed, three quarters of a rood having produced in the previous year 7 cwt. of seed, sold in Dublin for 11*l.* 4*s.* The balance-sheet on the year showed a balance in favour of the farm of 97*l.*, though the annual rent and county rates amount to upwards of 100*l.* The secret of this advantage lies in the important facts, that there is no charge for labour, this being discharged by paupers, who would otherwise be idle; that all the produce is sold; and that no manure, excepting a small portion of charred peat for deodorising the night-soil (which is alone sufficient for nourishing the crops) is bought. The agricultural master, who has effected all profitable returns by the very moderate labour of pauper men, women, and children, receives but 33*l.* a year with rations. The Mangold Wurzel sold produced 56*l.* in cash; Cabbages, 21*l.*; and Flax upwards of 40*l.* A donkey and a jennet have been kept for market and other occasions, but the cost of keeping them is inconsiderable.

I only wonder at the apathy or the prejudices which prevent the guardians of the poor from generally urging the adoption of a similar system, which has been found so reproductive and self-supporting in Enniscorthy and other unions. Where there is a supply of ready labour, why not apply it in the best manner? From Enniscorthy many of the best specimens of industrial manufactures were exhibited in Dublin at the Crystal Palace, and obtained prizes. The farm productions are equally creditable to the Enniscorthy Union. Why is not a self-supporting system more the object of attainment by all persons concerned in the relief of paupers? And with land—the ready raw material of industry to many pauper localities—why is it neglected and unused? But, is the Enniscorthy Pauper Agricultural Farm a perfect model? No,—the stringent Poor-law rules admit of no relaxations. The most industriously disposed and willing labourers, who dig and trench the ground, and perform all the labour of it, have no claim to a better meal than that which is given to the most worthless individual on the premises; the master has no power of giving it. Not having the disposal of any rewards or inducements for labour, powerless in supplying the ordinary motives for action, he is left to his own contrivances and ingenuity for effecting objects which ought to be promoted by some authorised system of easy and general application.

Home Correspondence.

The Harvest.—I have just returned from a journey through a great part of Cheshire, Warwickshire, Staffordshire, Leicestershire, and the North and West Ridings of Yorkshire, and in the whole of this district I found crops nearly of the same character. Wheat and Barley both heavy crops; and Wheat, in consequence of the sunny weather we have lately experienced, has suffered far less from rust than was at one time feared. Oats are not so regularly good, but in many places they are a very heavy crop. Beans, though long in the straw, are not very well laden. Turnips show a little shrivelled in the leaves, and in some places yellow leaves are appearing, from the severe drought of the last 10 days. Potatoes, from the same cause, appear to be ripening without much indication of the disease. The high winds we had about a fortnight ago having been succeeded by continuous bright sunshine, caused grain of all kinds to ripen at once, as it were; every available hand is actively employed with the sickle, scythe, or reaping machine, and this week will see nearly all the white corn cut, and much of it in the stack-yard. We have had comparatively few Irish reapers this year, and corn being all ripe together, has caused a great advance in wages. Men and women were this morning engaged here (Yorkshire) at 2*s.* 8*d.* a day and a quart of beer; and 12*s.* per imperial acre is a general price for cutting, binding, and stooking Wheat. *Roaldus, Sept.* 4.

The "Economical Manure."—I hope the exposure you gave in your paper some weeks since concerning the "economical manure," will have sufficient weight to caution people from using it; and I am desirous of adding my testimony to the truth of its worthlessness. I employed it in manuring four different crops, and applied it to each in different ways, and in no case with the least benefit; and from my placing confidence in the testimonials written in its favour, I have entirely lost my Turnip crop where I used it; and I think it is doing a public duty to make known such statements, in order that others may not be taken in as I have been this year by it. I used a small portion of another artificial manure, which was given me by a friend, alongside of it, which answered well; and the Turnips can be easily distinguished even some little distance from the field. Should you wish it, I am ready to give my name and address; but for the present, I subscribe myself your *Constant Subscriber, Sept.* 4.

The worst of Thin Seeding.—Half the seed in a field of Wheat not coming up, the other half tillered beautifully, but this very warm weather has ripened the main stalks so quickly that the tillered stalks have their ears still green all over the field. *Somerset.*

Wheat, early sowing.—In addition to our main breadth of Wheat, grown this year at 1 foot apart, which is extraordinarily fine, with most ears containing 80 to 100 grains, not yet threshed, and therefore we are not able to give its result at present, we have experimented on one square yard of Piper's Thickset, at 6 inches apart, or 18 plants, equal to something less than one peck of seed per acre. The result is, one plant failed, and the remainder produced 466 ordinary ears. One plant inadvertently crept in close to another, which produced only six weak ears, whilst the other 16 averaged about 28 ears, at 40 grains each (not extraordinary). The exact produce is one quart, equal to 18 quarters 7 bushels 1 peck per acre. [An experiment of this kind is, of course, entirely useless for the purpose (to which it is here put) of calculating from it acreable produce.] This was sown at the end of August, with our main breadth. The stubble is reserved for the inspection of any one who may doubt the correctness of this statement. We also sowed a small plot last July, which proved productive in a superlative degree, with ears surpassing any we had ever before seen; but unhappily the birds devoured it all, notwithstanding it had been netted, to protect it. It stood the winter well. *Hardy and Son, Maldon, Essex, August* 30.

Disease in Wheat.—I beg to direct your attention to the enclosed ears of Wheat, and should feel much obliged if you can inform me of the cause of their singular appearance. They are taken from a field of 14 acres in my occupation, and nearly one-fourth of the crop is in the same state as the enclosed ears. The Wheat was sown on the 1st February in the present year, of the kind known as Nursery Wheat, after Turnips fed off in the winter, the field having been drained in the spring of 1853. The soil is a brash of about 6 inches in depth, resting on the rock, with layers of clay between each bed of rock. A few days after the Wheat was in bloom we had a succession of cold frosty nights, and I would ask if the frost acting on the immature grain whilst in a soft and pulpy state, would be likely to produce the singular appearance they now present. The ears labelled No. 1 present the most usual appearance of the blighted ears. There are, however, many which contain two grains in a husk, as those marked No. 2; whilst some, like No. 3, seem to show a remarkable tendency, after the first grains were checked in their growth to develope others. I have never before seen any Wheat in the state like those I now forward to you. *W. Salway, Newnton, Tetbury, Aug.* 26. [Your Wheat is affected by "Ear-cockles, purples, or peppercorns." If you crush one of those black grains, moisten it, and leave it for a while in the warm sunshine, you will find, on examining it with a microscope, that it is a mass of "minute eel-shaped animalcules, which are in active movement, twisting and wriggling to and fro like so many snakes." Your experience is extraordinary only as regards the great quantity present in your crop. It is not unfrequently met with, but not in such large quantity. The animalcule is called Vibrio Tritici. The following is Professor Henslow's account of it:—"When a sound grain of Wheat is sown by the side of one infested with the vibrio, the young plant which springs from the former is not infected before March; but then the animalcules begin to find their way from the blighted grain into the earth, and thence into the young corn. They gradually ascend within the stem till they reach the ovule (or young state of the seed) in the flower bud, even before the ear has shown itself. Roffredi believed that they do not increase in size till they have reached the young seed, but that after this they grow very rapidly, soon deposit a large number of eggs, and then die. Mr. Bauer has questioned the accuracy of Roffredi's observation, and supposes the specimens found in the stem to belong to another species. The young are hatched in about 8 or 10 days after the eggs are laid, and speedily attain to about the $\frac{1}{33}$ of an inch in length, and the $\frac{1}{1200}$ of an inch in diameter. When full grown, the vibrio acquires a monstrous size compared with one of the multitude which composes the cottony mass in the blighted grains, becoming a quarter of an inch long, and the $\frac{1}{80}$ of an inch in diameter. I am not aware whether any precise estimate of the numbers actually found in a single grain has ever been made, but a slight calculation will show us that not less than 50,000 of the young might be packed in a moderately sized grain of Wheat. Mr. Bauer seems to think that more than one generation is produced in the course of a season. The most curious circumstance which observers have noticed in the economy of this animal, and which I have had an opportunity of fully verifying, is the wonderful property it possesses of retaining its vitality under circumstances in which we should have supposed it impossible that it could have lived. If a mass of them is suffered to become so perfectly dry that the slight touch of a hair might reduce them to powder, and they are again moistened in a drop of water, they will speedily revive, and become as active as before. They may thus be dried and revived many times before they are killed. Mr. Bauer states the limit to such revivals to lie between six and seven years."]

Peruvian Barley.—I have sent you a few ears of Peruvian Barley. I planted about 20 perches 15 inches from row to row, and 12 inches in the row. From the long-continued dry weather, more than half did not vegetate, but the produce is, I consider, large, although it has ripened very unevenly, as you will see by the sample sent, all having been cut from the produce of one grain. I had the produce of one grain rubbed out, which counted 3924 grains, the stubble of which I have sent you; some of the ears contained 90 and 96 grains. *J. S.* [Your specimen, a single plant bearing about 90 stems, is the common naked six-rowed Barley or Bere. It is called Siberian Barley. Siberia and Peru, however, are *near enough*—!—to justify the alteration now-a-days, when novelty depends on name. It is a hardy sort, and might very well serve as a winter Barley.]

Reviews.

The Age of the Ox, Sheep, and Pig; being the substance of two Lectures delivered before the Royal Agricultural Society of England on the structure and development of the teeth of these animals, by James B. Simonds, Professor of Cattle Pathology in the Royal Veterinary College. Published by order of the Society. W. S. Orr and Co., Paternoster Row.

The importance of the subject here treated of needs no vindication in the eyes of those engaged every year in the purchase and sale of farm stock. The need of a new work upon it, containing information up to the present date, is plain to all who are aware how entirely altered all the indications of age have become in the case of our domesticated animals by the increased precocity and early maturity induced by the attention of our breeders. Animals which, at two years of age, exhibit all the external character, as regards size, weight, and general development, which they used to do at three or even four years old, will be found as far in advance of their former indications in detail as they are upon the whole; and their teeth, as well as frame and flesh, are proof of this. The tables in which Prof. Simonds gives the results of more than 2000 observations are strikingly illustrative of this. They are as follows:—

Dentition of the Ox.

Table of Early Average. The breed and other causes favouring development.	Table of Late Average. The breed and other causes retarding development.
Yrs. Months.	Yrs. Months.
1 9 Two permanent incisors	2 3 Two permanent incisors
2 3 Four "	2 9 Four "
2 9 Six "	3 3 Six "
3 3 Eight "	3 9 Eight "

Dentition of the Sheep.

2 3 Third pair " "	2 9 Six "
3 0 Fourth pair " "	3 6 Eight "

Dentition of the Pig.

	At Birth.	One Month.	Three Months.	Nine Months.	Twelve Months.	Eighteen Months.
Fœtal { incisors	4	4	4	...	...	...
Fœtal { tusks	4	4	4	...	...	...
Temporary incisors	...	4 central	8 central & lateral	8 central & lateral	4 lateral	...
Permanent incisors	...	...	...	4 corner	8 central & corner	12 central, lateral, & corner
Permanent tusks	...	...	...	4(cutting)	4	4
Total in both jaws	8	12	16	16	16	16

The two former of the tables indicate what a variety of stages of development may exist at any one age in different animals, and how completely in the rear of existing facts the publications existing on them are which take for granted the truth of all the dilatory developments indicated in the second column. Many instances could be given in which animals have been disqualified by judges for competition, owing to the certificates of age being held to be falsified by the state of the animal, when the certificate was perfectly true, and the only thing in error was the rule which has hitherto guided judges in determining age. Professor Simonds has done a great service by putting us all right on these points; the immense number of facts on which he has based his inferences seems to be conclusive as to their trustworthiness.

The introductory chapter contains material of high interest to the comparative anatomist and scientific man. The remaining parts of the book are more practical and descriptive, and to an extract taken here we direct the attention of the reader. The following gives the contrast between previous authorities and Professor Simonds on the dentition of the ox.

"There are few questions which have a more direct influence upon the success of agricultural exhibitions than that of a prize being obtained by an animal of proper age. The information which we have hitherto

possessed upon the subject of dentition has availed us but little in disputed cases. Practice here has not harmonised with theory. Several years since I became satisfied that nothing which had been written upon the dentition of either the ox or sheep in this country could be relied upon, and I resolved, by an extensive examination of animals of all breeds and under all circumstances, to ascertain what the facts were which belonged to the process. My position in the Royal Veterinary College first required this, for, being ever desirous of imparting practical information, I felt the want of this knowledge when speaking to the class year after year on the subject of dentition. It is true that my examinations had extended over a considerable period of time and were numerous, but from the uncertainty which belonged to many of them, with respect to the exact ages of the animals, I was impressed with the belief that they were insufficient to found correct conclusions upon.

"On the honour being conferred upon me by the Royal Agricultural Society of electing me as its veterinary inspector, this subject assumed a more important aspect. Forthwith I determined to examine all the animals brought together at the annual exhibitions, and make records of the facts relating to their dentition. This was done to some extent at the Windsor meeting, but at Lewes and Gloucester it was fully carried out. Note-book in hand I went from stall to stall and recorded the condition of the animal's teeth without reference at that time to its stated age. Subsequently the two things were compared, and I have now before me the notes of upwards of 800 oxen of certified age, the condition of the teeth of each standing on the opposite page to that which gives the age, breed, and sex of the animal. The data thus obtained are embodied in a tabular form for more easy reference.

"Before proceeding to these details, however, it is right for the better elucidation of the subject, that I should first bring before my readers the observations of other persons upon the dentition of the ox. I select for this purpose the statements which are contained in the work on cattle, published by the Society for the Diffusion of Useful Knowledge. The writer of this, when speaking of the age of oxen as indicated by their teeth, says that—

"'The mouth of the newly-born calf presents an uncertain appearance, depending on the mother having exceeded or fallen short of the average period of utero-gestation. Sometimes there will be no vestige of teeth, but generally, either two central incisors will be protruding through the gums, or they will have arisen and attained considerable bulk.

"'About the middle or close of the second week a tooth will be added on either side, making four incisors. At the expiration of the third week, the animal will have six temporary incisors, or front teeth.

"'At a month, the full number of incisors will have appeared These are the temporary or milk teeth. The enamel will be seen covering the whole of the crown of the tooth, but not entering into its composition, as in the horse, and it will be observed, that the edge is exceedingly sharp. The only indication of increasing age will be the wearing down of these sharp edges, and the appearance of the bony substance of the tooth beneath. The two corner teeth will be scarcely up before the central teeth will be a little worn. At two months, the edge of the four central teeth will be evidently worn; yet as the wearing is not across the top of the tooth, but a very little out of the line of its inner surface, the edge will remain nearly or quite as sharp as before. At three months the six central teeth, and at four months the whole set will be worn, and the central ones most of all; but after the second or third month, the edge of the tooth will begin to wear down, and there will be more of a flat surface, with a broad line in the centre.

"'About this time a new change will begin, but very slowly, to be seen. The central teeth will not only be worn down on their edges, but the whole of the tooth will appear diminished, a kind of absorption will have commenced. There will be a little but increasing space between them. The face of the tooth will likewise be altered, the inner edge will be worn down more than the outer, and the mark will change from the appearance of a broad line to a triangular shape. The commencement of this alteration of form and diminution of size may be traced to about the fourth month. The two central incisors at eight months are not above half the size of the next pair, and they are evidently lessened. At 11 months the process of diminution will have extended to the four central teeth. The vacuities between them will now be evident enough. At 15 months six of the incisors will have this shrunken appearance. . . At 18 months old, the corner teeth will not be more than half their natural size; the centre ones will be yet more diminished, and the vacuities between them will be almost equal to the width of the teeth. . . . All this while, the second set of teeth, the permanent ones, have been growing in their sockets, and approaching towards the gums; but not, as is said to be generally the case with other animals, and with the human being in particular, pressing upon the roots of the milk teeth, and causing them to be absorbed, until at length, losing all hold in the socket, they fall out. The process of absorption commences here in the whole milk tooth, and as much in the crown or body of it as at its root.

"'The process of general diminution seems now for awhile retarded; it is confined to the central teeth, and they gradually waste away until they are no larger in the body than crow-quills. About the expiration of the second year, or a little before, the milk teeth are pushed out or give way, and the two central teeth appear. The process of absorption will be suspended with regard to the two outside pairs of milk teeth, but will be rapid with regard to the second pair, and a little before the commencement of the third year they will disappear. Thus the three-year-old beast will have four permanent incisors, and four milk teeth.

"'Now the remaining milk teeth will diminish very fast, but they show no disposition to give way, and at four years old there will be six permanent incisors, and often apparently no milk teeth; but if the mouth is examined, the tooth that should have disappeared, and the tooth that is to remain until the next year, are huddled together, and concealed behind the new permanent tooth.

"'At the commencement of the fifth year the eight permanent incisors will be up, but the corner ones will be small; so that the beast cannot be said to be full mouthed—*i. e.*, all the incisors fully up—until it is six years old.'

"The author finishes this account by alluding to the writings of others who have described dentition as being perfected at an earlier date, and adds, 'we have no hesitation, however, in appealing to the experience of the breeders of cattle for the general accuracy of our account.'

"It is evident from this that the author was satisfied with the correctness of his conclusions; and as his work is regarded as the standard one on the diseases, &c., of cattle, so we cannot be surprised that his views of dentition should have been generally received. Much might be said to show that many of the rules laid down in the above description are rather the result of imagination than of practical investigation, notwithstanding the confidence with which the author appeals to the experience of the breeders of cattle. I refrain, however, entirely from this task, rather desiring to lay before the reader the facts as I have found them."

These facts are given in a tabular form above, and will be given in greater detail in an extract from the work which we shall next week publish.

Calendar of Operations.

SEPTEMBER.

BERWICKSHIRE MEESE FARM, *Sept.* 4.—All hands are now engaged in securing the grain crop. In spite of the cloudy weather in August (as well as during summer), corn changed colour rapidly, and we had a full week's shearing in the end of that month, which is not much later than an average of seasons. Wheat bulks well in the stook; but the all but universal ravages of the fly after blooming time will reduce the yield to not more than an average. Barley is much superior to the produce of last year, in length both of straw and ear. Oats, however, are generally but a light crop, and below an average as to quantity of grain. Few Beans are ready yet. They present a luxuriant haulm, but must be sadly deficient in corn, for just when the bloom fell off, they were covered with myriads of black flies, which prevented the formation of one single pod on the upper half of the stalks. There are one or two good crops of Peas, but they are mostly the reverse. The fine, drying, westerly breezes of last week have induced most people to begin carrying; and never having got a drop of rain, the first cut grain is in fine order. The weather has, however, changed suddenly for the worse. This afternoon the wind veered to the north, and fell at night, and we are now enveloped in a slight but steady drizzle. But this, if it pass soon, will leave no bad effects behind. Turnips, in some instances, begin to suffer from mildew, but generally are rooting well. Potatoes are much affected within the last two or three weeks—some think worse than last year. Pastures are good yet, but not very feeding, and half fat cattle are now laid on to Purple-top Yellow Turnips. *J. T.*

WEST SUSSEX, *Sept.* 5.—We have once more finished harvest, and we may put it down as one of the finest that we ever remember. From the beginning to the end we have not had rain to stop any of our work; and whatever the produce may be, such as it is, it will be fit to come into market as early as it can be threshed out, so that we may expect prices to be soon at their lowest ebb. Already the steam engines are at work threshing out, and they appear to have established themselves in favour of the farmer, but this may be called the first year that they have made much progress in this part of the county. The case will no doubt be the same here as we have seen it further west, very few trials will be needed to reconcile us to them. There are but few that like them the first time, because they will not believe before trial that they can thresh from 80 to 100 sacks a day, and not being prepared to clear away such a quantity of corn and straw they get in a mess, and it takes some time to get the barn toned down to its old quiet state. But once prepared for it, then dispatch is pleasant, and the weary round of the horse machine is anything but agreeable after it. We have heard various reports respecting the return of the Wheat, some putting it at 7, others at 10 sacks per acre, and the latter, I think, will not be far from the mark on the rich coast lands here. Barley that we have seen in the market is very good, although it has not had any of those fine dews that are supposed to do it so much good, and perhaps the present season may do something to prove that the less damp it gets after cutting so much the better. They say the dew swells it out; so it may, but it adds nothing but water to it, and that must evaporate before it is harvested. Oats are heavier than they have been for some years, and in every way good. The same may be said of Peas; we have seen several samples of new, and they are all above the average in quality. Beans have not yet made their appearance in the market, and they are likely to be the only drawback. Respecting the root crops we can hardly speak favourably now. They have held on well, when we might have expected that the severe drought would have stopped their growth; but now that the under leaves are beginning to fade (which is ordinarily a sign that the roots are beginning to swell faster), the whole plant seems inclined to flag, and without rain they must come to a stand-still. As for Grass in the field, that is out of the question. We may safely say that there has been no vegetation in it for the past two months, and the cattle have now to look into the straw yards for assistance. We are not able to get ploughing for Wheat, the land being so hard, but have sown a few acres of Trifolium, though certain that it will not show itself till rain comes. We have ploughed the land for it, and we think that must be best; it is more likely to prevent the ravages of the slug, which proved so destructive to it last year. We shall now take advantage of the weather to get some of the Wheat stubbles cleaned, as we can never have a better chance. *G. S.*

Notices to Correspondents.

BRANCHED BARLEY: *G S.* Much obliged. It is very curious and shall be figured.

BRISTOL RED: *Anon.* Those who grow it must advertise it.

DISEASES: *Constant Reader.* See answer in p. 537.

EARS OF WHEAT: *J. B. Maunsell.* The ear sent appears to be the "Bristol Red," a very productive sort. We have no personal experience of it, and do not know what the millers say of its quality.

FAIRS: *Anon.* Stagshaw Bank Fair (for Cheviots). The first fair is held on Whit-Friday for ewes and lambs, hogs, and wedders; on Saturday for short-horn cattle, Scotch and Irish cattle and horses. The fair is held on July 3, for sheep, principally hogs and wedders. This is the last show for unclipped sheep; July 4 is again for cattle and horses. Third fair is on August 6, for lambs only. The fourth is on October 24, for ewes and tups. Nine-tenths of the sheep shown at these fairs are Cheviots and mixed breeds.

LINSEED AND CORN CRUSHERS. We should have mentioned in past reports of the English and Yorkshire agricultural meetings, that the prizes at both for this implement were awarded to Messrs. Turner, of Ipswich.

MANURE: *Urban.* 3 cwt. of guano per acre, and an equal quantity of common salt, mixed with a cart-load of black turf ashes, will be a good dressing for Mangold Wurzel; and 2 cwt. of guano, 1 cwt. of nitrate of soda sown broadcast in wet weather will do for Grass land.

POULTRY: *Reader.* By all means procure "Fowls," by Baily; you will there obtain the best information respecting the fattening of fowls for table.—*Robert Watts.* The white game fowl must be of a pure white plumage, without any foul feathers. A red and white, or yellow and white game bird, is a "Pile." The Staffordshire, Worcestershire, and Cheshire Piles are the most famous. A preference given to either variety is purely a matter of taste; they are all of equal value. Piles will not be bred from white game fowls, but they can be by crossing the red and white varieties.—*H. M. Cladge.* In our next.

SPRING FEED: *Leisurely.* You had better sow Rye than Rape for the earliest chance of spring feed now.

THISTLES: *L E.* Pull them in wet weather whenever big enough to lay hold of, and never allow them to flower.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

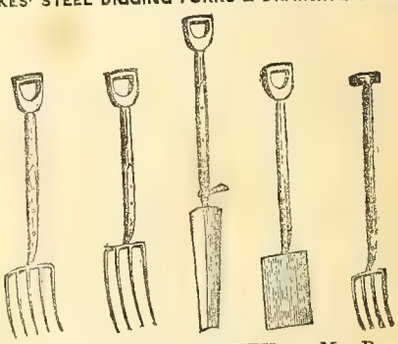
8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water: Fire Engines, &c.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 30 per cent., which advantage is offered to the public.
BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who, on application, will forward wholesale and retail prices.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.

This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

CHEAP WIRE GAME & POULTRY NETTING, 5*d.* per running yard.
GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

		Galvanised.	Not Galvanised
24 in. wide,	2 in. mesh,	7*d.* per yard.	5*d.* per yard
30 in. "	2 in. "	9*d.* "	6½*d.* "
36 in. "	2 in. "	10½*d.* "	7½*d.* "
48 in. "	2 in. "	1*s.* 2*d.* "	10*d.* "

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. Fox, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d* per square foot, for the usual sizes required, many thousand feet which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, 296, Oxford Street, London.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt.

HARTLEY'S PATENT ROUGH PLATE, for Roofing Conservatories, Halls, and Public Buildings.

PLATE, CROWN, and SHEET WINDOW GLASS.

Coloured and Ornamental Glass of every description.

Glass Milk Pans, Pails, Tests, and Measures; Cream Pots and Syphons; Churns, Butter Tests and Slabs; Tiles and Slates; Bee Hives, &c.

Moore's Patent Ventilator and Lockhead's Patent Perforated Glass, for Dairies and Greenhouses.

Aquavivariums, Fern Shades, Propagating Glasses, Fruit Protectors, Preserve Jars, Cucumber Tubes, Hand Lights, Flower Vases, Labels, &c., and all kinds of Agricultural, Horticultural, Architectural, Domestic, Scientific, and Ornamental Glass, British and Foreign, at the lowest prices.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

Packed in Boxes of 50 feet each.

6 by 4 and 6½ by 4½	...	...	...	10*s.* 6*d.*	per box.

8 „ 6 „ 8½ „ 6	...	...	...	13 6	„
9 „ 7 „ 9½ „ 7½ and 10 by 8			...	15 0	„

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2*s.* each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,

116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

THE CONICAL HOT-WATER BOILERS, as invented by John Rogers, Esq., are only to be obtained of JOHN SHEWEN, IRONMONGER, Sevenoaks, Kent.

Contracts given for Heating.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

ENCAUSTIC TILE PAVEMENTS.

MAW AND CO., Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "THE SUCCESSFUL IMITATION OF OPY'S ALEXANDRINUM, IN THE BEAUTIFUL ENCAUSTIC TILE PAVEMENT OF CLOISTERS OF BYZANTINE COURT," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.

Specimens at 11, Aldersgate Street, City.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

MESSRS. J. WEEKS' NURSERY, KING'S ROAD CHELSEA.—A great alteration is being effected at this Establishment, where the various Horticultural buildings spread over nearly an acre of ground, and extending together to about 770 feet in length, covering an area of 20,000 feet, have hitherto been heated by seven boilers. These boilers worked efficiently and economically, but as great practice in every art leads to improvement, so in this case have the MESSRS. WEEKS found it desirable to replace these seven boilers by one. This one will heat every house and pit efficiently, either altogether or separately, according to pleasure. This alteration will effect a very important saving annually, as the one boiler will not consume more than two out of the seven boilers superseded, whilst the time and labour hitherto expended over the seven, will in future be confined to one. The necessary alterations for this important arrangement are now in progress, and will be completed within a fort night, and the Nobility and Gentry interested in the principle heating by Hot Water can here see it practically carried out, and have it thoroughly explained in all its details.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

GLASS.

THOMAS MILLINGTON, Importer of Foreign Sheet Glass, requests attention to the present Prices of Glass and Stock sizes, which are cheaper and better than those of English manufacture:—

PACKED IN ONE HUNDRED FEET BOXES, THIRDS QUALITY, BOXES INCLUDED.

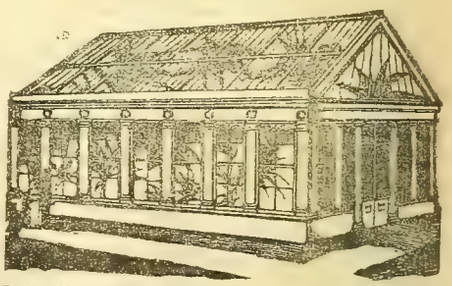
EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, ENGINEER, Battersea.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

LINSEED AND CORN CRUSHING MILLS.

E. R. AND F. TURNER, St. Peter's Iron Works, Ipswich, have, during the present season, obtained the Prizes of the Royal Agricultural Society at Lincoln, the Bath and West of England Society at Bath, and the Yorkshire Agricultural Society at Ripon, for their celebrated ROLLER MILLS for Crushing Corn, Seeds, &c. These are manufactured of various sizes, particulars of which, with Illustrated Catalogue of Steam Engines, new Prize Chaff Cutter, and a variety of other Implements, manufactured by E. R. & F. TURNER, may be had free on application at the Works, Ipswich, or by Post, inclosing two postage stamps.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as highly conducive to health and longevity. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTRIFICE, stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, it will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the teeth firmly in their sockets; and from its aromatic influence imparts sweetness and purity to the breath.—Price 2*s.* 9*d.* per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by chemists and perfumers.

UMBRELLAS.

DAWSON'S PATENT.—If you require an Umbrella that is superior in every respect to any other make, being not only waterproof, but at least five times more durable, and, according to its quality, equally low in price, ask for, and insist upon having, DAWSON'S PATENT WATERPROOF. Wholesale Warehouse, 9, King's Arms Yard, Moorgate Street.

GLENFIELD PATENT STARCH, used in her Majesty's Laundry, and WOTHERSPOON'S machine-made CONFECTIONARY, MARMALADE, JAMS, JELLIES, &c., which gained the Prize Medal of 1851, may be had of all Grocers; Wholesale of WOTHERSPOON, MACKAY, & Co., 66, Queen Street, Cheapside, London; and ROBERT WOTHERSPOON & Co., Glasgow.

MR. MECHI'S DRESSING BAGS, of an entirely novel construction, as Exhibited and Sold at the Crystal Palace, combine all the advantages, of an ordinary Desk and Dressing-case, with numerous other conveniences for Apparel, and are varied in cost to suit the economic, utilitarian, or the luxurious, either for ladies or gentlemen.—4, Leadenhall Street, September 9.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES. — METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130B and 131, Oxford Street, second and third doors west from Holles Street.

ASTROLOGY. — Persons residing in London or elsewhere can send any Address, Christian and Surname, and Age, in a letter containing 13 postage stamps, to Professor MELVILLE, Prince's Road, Lambeth, London (the only Acrostic Astrologer in the universe), and they will receive by return of post, special Poems on their names, in which their destinies will be revealed.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling of, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2s. per Package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of Moustachios." H. ADAMS.—"It has prevented my Hair falling off" J. HICKSON.—"It has quite checked the greyness that was coming on." Mrs. ELDER.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last 11 years, and is applicable to every kind of single and double Rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7s. 6d. in postage stamps, cash, or Post-office order, payable at the General Post-office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 3 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

NERVES.

DR. GRANDISON'S PILLS for strengthening the Nerves are sold in London by Mr. RICHARDS, 40, New Bridge Street; Mr. SANGER, 150, Oxford Street, and other respectable Chemists. Boxes can be sent by post.—Price 1s. 1½d., 2s. 9d., and 4s. 6d. each.

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1s. 1½d. and 2s. 9d. per box.—Mr. William Courtney, of Barton Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp

HOLLOWAY'S OINTMENT AND PILLS THE FIRST REMEDIES IN THE WORLD FOR THE CURE OF BAD LEGS.—Annie Williams, of Village Place, Claton Street, Liverpool, states in a letter to Mr. Robinson, Druggist, 51, Copperas Hill, Liverpool, that she had an ulcerated leg for many months, and that she tried various remedies in anticipation of effecting a cure, which appeared quite hopeless, as it became worse every day until she made use of Holloway's Ointment and Pills; by the first dressing there was a decided improvement, and in a few weeks the wounds were completely healed, and she now enjoys excellent health —Sold by all Vendors of Medicine, and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1s. 1½d. per box.—Observe that "THOMAS PROUT" is on the Government stamp.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads from 17s.; Portable Folding Bedsteads from 12s 6d.; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21s.; and Cots from 21s. each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2l. 19s. to 13l. 13s.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

39, OXFORD STREET (corner of Newman Street); Nos. 1 and 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

DR. DE JONGH'S

LIGHT BROWN COD-LIVER OIL, PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS. THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM, AND ALL SCROFULOUS DISEASES.

Approved of and recommended by BERZELIUS, LIEBIG, WÖHLER, JONATHAN PEREIRA, FOUQUIER, and numerous other distinguished Scientific Chemists, prescribed by the most eminent Medical Men, and supplied to the leading Hospitals of Europe—effecting a cure or alleviating symptoms much more rapidly than any other kind.

Extract from THE LANCET, *July* 29, 1854.

"After a careful examination of the different kinds of Cod Liver Oil, Dr. de Jongh gives the preference to the Light Brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod Liver Oil no doubt partly depends. Some of the defieiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. In the preference of the Light Brown over the Pale Oil we fully concur.

"We have carefully tested a specimen of the light brown Cod-liver Oil prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. ANSAR, HARFORD, & Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by

ANSAR, HARFORD, AND CO., 77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and the British Possessions; at the following prices:—

IMPERIAL MEASURE, half pints, 2s. 6d.; pints, 4s. 9d.

*** Four half-pint bottles forwarded, CARRIAGE PAID, to any part of England, on receipt of a remittance of Ten Shillings.

TO NURSERYMEN AND OTHERS.

TO BE LET, at Epsom, in Surrey, the EPSOM NURSERY, late in the occupation of Mr. Young, being about 4½ acres. There is a small NURSERY STOCK, which it is desirable should be taken to. For particulars, inquire of Mrs. WILKINS, 60, Queen's Row, Walworth.

TO MARKET GARDENERS, FARMERS, AND OTHERS.

TO BE LET, a MARKET GARDEN GROUND, with immediate possession, about 30 acres, 7 of which are under Fruit Trees; the whole is in a good state of cultivation, with the usual crops; well supplied with water; at a low rent, and two miles from the London markets.—For particulars, apply to Mr. S. BRANDON, 32, Paradise Row, Rotherhithe; Mr. HAYWARD, Heathfield, Nine Elms; or Mr. HARWOOD, Stepney Green.

TO NURSERYMEN, GARDENERS, AND FLORISTS.

TO BE SOLD, with immediate possession, a NURSERY of about an Acre, with Dwelling House and Seed Shop, to which is attached a good jobbing business. It is situated in a respectable and new neighbourhood, within three miles of London Bridge, on the Surrey side. The Stock, Fixtures, and Good-will to be taken at a valuation. This is a favourable opportunity for any persevering man.—Address, post paid, to Mr. B. ANDREWS, Horticultural and Agricultural Auctioneer and Valuer, Peckham, Surrey.

TO MARKET GARDENERS, NURSERYMEN, AND FLORISTS.

NEAR TO KEW BRIDGE, AND ONLY SIX MILES FROM LONDON.

TO BE SOLD, with immediate possession, the Interest in the unexpired term of about 10 years of Lease of 17 acres of highly cultivated FRUIT and GARDEN GROUND. Any person wishing to enter into Market Gardening or Nursery Business will find this a very eligible opportunity, the whole of the Land being in the highest state of cultivation, and the Trees in full bearing condition.—For particulars, apply to Mr. ATWOOD, Land Agent and Valuer, Mortlake, Surrey.

TO BE SOLD, GREENHOUSES — a bargain. One 12 feet long and 8 feet wide, 15l.; and one 21 feet long and 12 feet wide, 25l. Plans and particulars sent on receipt of a postage stamp, to Mr SMITH, Builder, &c., 1, Lower Street, Islington Green. Greenhouses and Garden Lights, Window Sashes, Doors, &c. from 6d. per foot. Country orders forwarded.

TO IRONMONGERS, NURSERYMEN, AND SEEDSMEN.

The Trustee on the Sequestrated Estate of HAMILTON LAIRD, Cupar Fife, is prepared to receive Tenders for the following subjects, either together or separately, viz.:

I.

THE IRONMONGERY STOCK AND FITTINGS in Shop and Cellars at the Cross of Cupar, consisting of a new and well assorted class of goods fitted for the trade of the district, and valued at about 1050l. The Lease to Martinmas 1858 of the Shop, &c., and Dwelling-house above, may be obtained along with stock if desired. The Shop is in the very best position for the trade of the town and district, and has been occupied as an Ironmongery Shop for the last 50 years. It is seldom that so good an opening for a profitable business occurs.

2. The LEASE of the NURSERY situated about half a mile to the south of Cupar on the Edinburgh Road, well known throughout the whole Eastern District of Fife for the last 50 years, together with the valuable and well-selected Stock therein, of Forest Trees, Shrubs, Flowers, &c. The extent is about Five Acres, and the Lease is current for 13 years from Martinmas next at a rent of 35l. The Stock is in the very best condition for an immediate entry, and is valued at about 500l.

3. A STOCK of SEEDS in Lofts, consisting of Rye Grass, Clover, Turnip, Cabbage, Garden Seeds, &c., valued at about 90l.

Sealed Tenders to be lodged on or before the 26th inst., with ANDREW TAYLOR, Bank Agent, Cupar, the Trustee; or W. A. TAYLOR, Writer, Cupar, either of whom will show the Stocks and Valuations, and furnish further information.

Cupar Fife, September 9, 1854.

TO BE SOLD, cheap, nearly new, HOT WATER APPARATUS, fitted with Stephenson's Patent Copper Boiler, and about 100 feet of 4-inch Iron Pipes, Bends, Small Tank, Chimney, and all complete.—Enquire of Mr. POTTER, Builder, Fulham.

TO BE DISPOSED OF, Six CYGNETS in very fine condition, and of good size.—Apply to H. T. HUMPHREYS, Kilmacow, Waterford.

SILVER SAND.

TO BE SOLD CHEAP, SILVER SAND, first or second quality.—Applications by letter to J. C. SPENCE, 32, Ludgate Hill, London, will be promptly attended to.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 11s. per ton; ditto, delivered 5 miles, 16s. per ton. Loam and Peat at moderate prices.—KENNARD BROTHERS, Swan Place, Old Kent Road, London.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

GOLDEN SPANGLED HAMBURGH FOWLS, Four Months Old. Cockerels, 10s. each; Pullets, 15s. each —very handsome —Address Mr. TAYLOR, Godalming, Surrey.

LIVING PLANTS AND SEEDS FROM ANGOLA.

MR. S. STEVENS, NATURAL HISTORY AGENT, &c., 24, Bloomsbury Street, London, begs to announce that he has lately had consigned to him FOR SALE, from the well-known botanist Dr. Wellwitsch, a small parcel of LIVING PLANTS, consisting of Terrestrial Orchids, Euphorbias, Aloes, Urginas, Crinums, Amaryllis, &c., in all 13 varieties, mostly in good order, and supposed to be new, which he offers for sale at 2l. 10s. the set. Latin descriptions accompany each plant.

Also a COLLECTION of SEEDS in fine state, consisting of about 110 varieties, with Latin descriptions to each packet; many of them are believed to be quite new to this country. They have been made into 10 sets, price 5l. the set.

Sales by Auction.

MR. W. T. ATWOOD will Sell by Auction, on TUESDAY, September 12, at 1 o'clock, at the Roebuck Inn, Turnham Green, Middlesex, the interest in the unexpired term of Lease of about 50 Acres of valuable FRUIT and GARDEN GROUND, in the highest state of cultivation, situate adjoining the high road from Hammersmith to Brentford.—Particulars may be had till day of sale by application to Mr. ATWOOD, Land Agent, Mortlake, Surrey; or Mr. PLOWMAN, 2, Upper Wellington Street, Covent Garden, London.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS beg to announce that they have received instructions from the administrators of the late Mr. W. Watts, of Stoke Newington, to sell by Auction, early in OCTOBER next, the whole of his unrivalled NURSERY STOCK, Greenhouses, and sundry effects. Further particulars will appear in future advertisements.

N.B. The unexpired Lease of the BARRETT GROVE GROUND, of 4 acres, will be submitted to public competition at the same time, unless previously disposed of by private contract.—For particulars apply to Mr. MACKAY, Stoke Newington, or of the Auctioneers, American Nursery, Leytonstone, Essex.

BINFIELD ROAD NURSERY, STOCKWELL.

To NURSERYMEN, AMATEURS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by the Proprietor, who is retiring from the business, to offer to public competition by auction at the Mart, Bartholomew Lane, on MONDAY, September 18, at 12 o'clock, the valuable lease of the above Nursery, of which 80 years are unexpired, consisting of 1½ acre of Land, walled round; also a substantial brick-built Cottage, Greenhouses, Sheds, Stock in trade, &c. May be viewed any day previous to the sale. Particulars may be obtained on the premises; of Mr. WEEKS', Solicitor, 10, Tokenhouse Yard, Bank; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM

To NOBLEMEN, GENTLEMEN, EXHIBITORS, NURSERYMEN, & OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the administrators of the late Mr. Joseph Fairbairn to submit to an unreserved Sale by Auction, on the premises, the Nurseries, Clapham, near London, on TUESDAY, Sept. 19th, 1854, and following day, at 11 o'clock each day, the valuable stock of Choice GREENHOUSE and STOVE PLANTS, which is particularly worthy the attention of noblemen and gentlemen enriching their collections, as well as the trade, from its excellence, comprising about 4000 fine Ericas, of all the leading kinds, amongst which are magnificent specimens of Massoni, Massoni major, Tricolor elegans, Cavendishi, Templæa, Metulæflora, Douglassi, Easonia purpurea, Austiniana, Vestita coccinea, Aitonia Turgida, Princeps Templæa, Murrayana, Favoides elegans, Ferruginea, Ventricosas, sorts, &c.; also 500 choice Azalea indica, 1000 double Camellias, 1000 Epacris, 500 Aphelexis, Mirraria coccinea, Acacia, Chorozema, Dillwynia, Diosma, Lilium lancifolium, &c. &c.—May be viewed two days prior to the Sale. Catalogues to be had (6d. each, returnable to purchasers) on the Premises; at the Shop, High Street, Clapham; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex. N.B —The Lease of the old-established Seed Shop and Nursery to be Sold; the Stock to be taken by valuation or agreement For particulars, apply to the administrators or Mr. JAMES FAIRBAIRN on the premises.

ON MARRIAGE.

Just published (to be had free, by enclosing 1s. or Twelve Postage Stamps, to Mr. WATSON, Clerical Agent, Robert Street, Adelphi, London).

MATRIMONY.—A Pamphlet on Matrimonial Alliances, which merits the attention of those who wish to settle honourably in life. By a Clergyman.

DAHLIAS.

MR. KEYNES was awarded a first-class Certificate for fancy Dahlia COMET, one of the finest striped and spotted flowers yet seen; also to Dahlia RUBY QUEEN, beautiful self, with good properties; also to Mr. Wheeler, Warminster, for Dahlia LORD BATH, fine dark puce; also PREMIERE PEERLESS, fine form, and very good; Mr. Dodds also received a first-class Certificate for a Seedling Fancy called MISS HERBERT, very beautiful form and colour. The Cup, value seven guineas, was awarded to Rev. C. Fellowes, Norwich; and the Silver Cup, value five guineas, was gained by Mr. Robinson, of Pimlico, as the second prize.—Salisbury, Sept. 9.

SPLENDID BULBS.

DAWE, COTTRELL, AND BENHAM (Successors to Frederick Warner) have just received their imported DUTCH and other BULBS in finer condition than for several years past, more especially their Hyacinths, Crocus, and Tulips. Catalogues on application.—3, Lawrence Pountney Lane, and 36, Moorgate Street, London (late 28, Cornhill). Established 1720.

GUERNSEY LILIES.—Persons desirous of procuring the above rare and choice Bulbs, can be supplied by S. BARBET, jun., 2, Cleveland, Doyle Road, Guernsey. Fruits and Vegetables bought on Commission, and carefully packed for exportation. Chaumontel Pears.

DUTCH FLOWER ROOTS.

PETER LAWSON AND SON, of Edinburgh, Seedsmen and Nurserymen to the Queen, beg respectfully to acquaint their customers and the Public that they have now opened a place of business in London for the convenience of their English correspondents, and will be prepared to execute orders of every description there. They have just received a supply of DUTCH FLOWER ROOTS, consisting of all the esteemed varieties, of which Catalogues may be had on application, and for which they solicit early orders.

London, 27, Great George Street, Westminster, Sept. 9.

NEW CLIMBING HYBRID PERPETUAL ROSE, THE "DUCHESS OF NORFOLK."

To be sent out for the first time about the end of October.

WM. WOOD AND SON have much pleasure in offering the above superb Rose to the notice of their Friends, feeling assured it will prove entirely distinct from any Rose at present known, and which cannot fail to give every satisfaction. The colour is a bright vivid crimson, the under side of the petals most delicately shaded with a fine glossy pink, presenting a pleasing contrast; but the most valuable property of this superb variety consists in its extraordinary vigour, and as a perpetual-flowering dark-coloured Climbing Rose surpasses any variety that has yet been offered.

Standards, Half Standards, or Dwarfs will be supplied at 10s. 6d.

N.B. A very liberal allowance to the Trade.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

SPLENDID NEW CINERARIA "OCTAVIAN."

JOHN KER, FLORIST, Bristol Road, Birmingham, has the pleasure to announce that he will commence sending out Plants of this truly magnificent Cineraria in October. It possesses more good qualities than any other out, viz., a fine robust habit, continues longer in flower, commencing in December; it will continue through the whole winter, till May, to send up dense trusses of large beautifully scented flowers, filling the whole house with their odour; flowers large, colours well contrasted, petals pure white, tipped with purple, broad and well imbricated, disc dark. Has been awarded a first class certificate of merit by the Midland Floricultural Society, and pronounced by the judges then present a magnificent variety. Has been highly commended in No. 289 of the "Cottage Gardener."

Plants 10s. 6d. each, Post-office orders payable at Birmingham. Parties wishing early attention will please give their orders. Many have been received, and will be sent out in rotation.

WANTED, Old WALNUT TREES, also various other TIMBER. Send lowest price and description to S. R., Thomas Davies & Co., Advertising Offices, 1, Finch Lane, City. (Copy the Address.)

TO NURSERYMEN, GARDENERS, AND OTHERS.

WANTED, by the Holbeach Burial Board, the following TREES and SHRUBS:—120 Deodara, 50 Cedars of Lebanon, 40 Red Cedars, 60 common Cypress, 60 Arbor-vitæ, 20 Irish Yews, to average 4 feet high. Also 14 Lombardy Poplars, 32 Huntingdon Elms, to average 9 feet high. Also 25 common Weeping Willows, to average 7 feet high. Also 1500 Evergreen Shrubs, in equal proportions, or thereabouts, the kinds to be submitted by the grower to the Board for their approval; to average 2 feet high. All the evergreens to have been moved in the nursery or repotted within two years. Separate prices to be stated for evergreens taken from pots and those from lines. The whole of the above to be included in one tender. Also a separate tender for Yew plants, to form a hedge or fence of 750 lineal yards, or thereabouts, to inclose the cemetery ground. The plants to average 2 feet high. Tenders to state the distance the Yews are proposed to be planted apart. Tenders to state when and where the above can be inspected. The whole will be required to be delivered free of expense at the Spalding Station of the Great Northern Railway, or at the Cemetery Ground in Holbeach, between the 1st and 15th days of October next. Tenders to be delivered at the Clerk's Office in Holbeach not later than 4 o'clock on Friday, the 15th of September instant. The Board do not pledge themselves to accept the lowest tender.

By order of the Board, E. G. AYLIFF, Clerk.

Holbeach, Sept. 9.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.

It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the Crystal Palace, Sydenham, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. Conservatories and Aviaries fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. Window blinds of every possible description, of the very best materials and workmanship.

N.B. An allowance to nurserymen and the trade.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, Sept. 9, 1854.

NORTH LONDON FLORICULTURAL SOCIETY.—The Annual Exhibition of DAHLIAS, &c., will take place at the HIGHBURY BARN GARDENS, Highbury, on TUESDAY, September 26.—Particulars may be had of G. SMITH Hon. Sec., Hornsey Road, Islington.

SOUTH BUCKS HORTICULTURAL SOCIETY.—The Dahlia Exhibition of the above Society will take place at the Royal Hotel, Slough, on TUESDAY, Sept. 19, 1854.
Particulars may be had of the Hon. Sec., Mr. D. BRUMMELL SMITH, Alpha Road, Slough.

DUTCH AND CAPE ROOTS.
BASS AND BROWN'S Importation of DUTCH ROOTS has come to hand in fine condition. Their AUTUMN CATALOGUE will shortly be completed. The part containing the roots is now ready, and will be forwarded immediately on application.
BASS & BROWN, Sudbury, Suffolk.

CHOICE CALCEOLARIA SEED.
JOHN AND CHARLES LEE beg to state, they are now sending out packets of choice Calceolaria Seed, saved from a very SUPERB COLLECTION, price 2*s*. 6*d*. per packet.—Vineyard Nursery, Hammersmith.

BECK'S NEW PELARGONIUMS.
J. DOBSON AND SON will forward a Coloured Drawing of LYDIA, CONQUEROR, and LAURA, post free, on receipt of 14 postage stamps. Gratis to purchasers of Plants.
Woodlands Nursery, Isleworth.

PELARGONIUMS.
J. DOBSON AND SON beg to announce that their annual descriptive Catalogue of the above, containing full descriptions of the best varieties of Beck's, Foster's, Hoyle's, and other raisers, at reasonable prices, may be had on application.
Woodlands Nursery, Isleworth.

NEW PELARGONIUMS.
J. DOBSON AND SON beg to call attention to the advertisement in this Paper of August 12, which contains a full description, with prices, of Beck's and Fuller's new and beautiful Seedlings, to be sent out the first week in October.
Woodlands Nursery, Isleworth.

SPLENDID BULBS.
DAWE, COTTRELL, AND BENHAM (Successors to Frederick Warner) have just received their imported DUTCH and other BULBS in finer condition than for several years past, more especially their Hyacinths, Crocus, and Tulips. Catalogues on application.—3, Lawrence Pountney Lane, and 36, Moorgate Street, London (late 28, Cornhill). Established 1720.

IMPORTED DUTCH BULBS.
LUCOMBE, PINCE, AND CO. beg leave to announce that they have just received their choice collection of the above, comprising all the newest and best varieties in cultivation, which are exceedingly fine, and in excellent condition, such, indeed, as cannot fail to give great satisfaction.
A Catalogue may be had on application.
Exeter Nursery, Exeter.

RARE AND HARDY CONIFERS.—A detailed List, with prices of the most Hardy and Ornamental Conifers, suitable for planting on the sea coast and other exposed situations, will be found in YOUELL AND CO.'s Advertisement of last week.
Royal Nursery, Great Yarmouth.

STRAWBERRIES.
J. HARGREAVES is now sending out Strong Plants of the four new Strawberries, viz., Ajax, Ruby, Captain Cook, and Fillbasket, at 10*s*. per hundred, or 25 each of any two sorts for 6*s*., package included; also, all the old sorts at 3*s*. per hundred.—Address, JOHN HARGREAVES, High Street Nursery, Lancaster.

STRAWBERRIES.—The BLACK PRINCE, 5*s* per 100; the PRINCE OF WALES, 10*s*. per 100. The two lasted in successive bearing here this year for 75 days.
Also CUTHILL'S Pamphlet on the Potato containing the best way of producing large and early crops, and avoiding the disease. With 20 more articles upon Fruits, Vegetables, and Salads. Price 2*s*., or by post 2*s*. 2*d*.
JAMES CUTHILL, Camberwell, London.

STRAWBERRIES.
BARRATT'S MAGNUM BONUM.—In size, this splendid Strawberry very far surpasses the "British Queen," is an exceedingly heavy cropper, and continues in perfection later than almost any other variety. Its flavour is really delicious, most nearly approaching the true Pine Apple of any kind yet known. Price per 100, 2*l*. 2*s*.; per dozen, 6*s*. Good strong Plants of the above are now ready for sending out by
St. John's Nursery, Wakefield. WM. BARRATT.
N.B. W. B.'s List of 40 kinds of Strawberries may be had gratis.

GRASS SEEDS.
SUTTON AND SONS *recommend the sowing of* GRASS SEEDS *at this season for Permanent Pasture, and are now prepared to supply excellent fresh Seeds for the purpose at very moderate prices.*
Also New Italian Rye Grass and Trifolium incarnatum, at moderate prices.—JOHN SUTTON & SONS, Seed Growers, Reading.

SUTTON'S IMPROVED ITALIAN RYE-GRASS.—If this Seed is sown in September, it will produce an earlier crop next spring than any other Grass, and three successive cuttings during the summer and autumn. Price 6*s*. 6*d*. per bushel.
Address, JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

THE BEST TWELVE HYACINTHS, imported by SUTTON AND SONS, Reading, for 9*s*., or, fine mixed, double for beds, 4*s*. per dozen.
Also JONQUILS, ANEMONES, CROCUSES, &c., cheap (as per Catalogue). Parcels of not less than 20*s*. value sent carriage free.
Address, JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

FINE NEW GERANIUMS, £1 1*s*. *per dozen.—For names of varieties, see* RENDLE'S *New Plant Catalogue, just published.*
Apply to WILLIAM E. RENDLE AND CO., NURSERYMEN and SEED MERCHANTS, Plymouth.

LISIANTHUS RUSSELLIANUS.
J. AND J. FRASER beg to offer the above, in strong and healthy plants, such as will make large specimens for flowering next season, at 2*s*. 6*d*. each.
Lea Bridge Road, Essex, September 16.

CHRYSANTHEMUMS.
R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's selection at 9*s*. per dozen. A list of names forwarded upon application.
CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Established plants, in 3-inch pots, at 3*s*. per dozen.
A remittance or reference to accompany all orders from unknown correspondents.
Paradise Nursery, Hornsey Road, Islington.

DICKINSON'S ITALIAN RYE-GRASS SEED is ready for delivery (by permission of Mr. East), from 7, Curzon Street, May Fair, London, as before. 7*s*. per bushel for present payment only. Post-office orders Piccadilly.

CATTELL'S EARLY BARNES CABBAGE,
" " RELIANCE "
" GREEN COLEWORT "
Plants of the above are now ready, 5*s*. 6*d*. per 1000, stout bedded; 4*s*. 6*d*. per 1000 good seedlings. No charge for crates, baskets, or packing. Packages of 5000 or more, delivered to the Edinbridge Station, South-Eastern Railway, carriage free.
Orders from unknown correspondents to be accompanied with post-office orders made payable here.—Address,
JOHN CATTELL, Westerham, Kent.

FINE BLOOMING BULBS, Carriage paid.
GUERNSEY and BELLADONNA LILIES, 4*s*. per doz.
VALLOTA PURPUREA ... ... 21*s*. "
AMARYLLIS FORMOSISSIMA ... ... 6*s*. "
Hyacinths, Gladiolus, Narcissus, Anemones, Ranunculus, Crocus, &c., may be obtained of
B. PAGE & Co., SEED-MERCHANTS, Southampton.
Trifolium incarnatum, 5*d*. per lb.; Davis' Winter Vetches, 42*s*. per bushel, 11*s*. per peck. Trade price of Guernsey Lilies to be had on application.

HUGH LOW AND CO. would inform their friends and customers that they are now receiving their BULBOUS ROOTS from Holland. The collection comprises all the kinds of Roots suitable for early forcing, and they have been selected with care from the leading houses in Haarlem. Any orders entrusted to them will have every attention, and they feel satisfied they are in a position to supply them to the satisfaction of their customers.—Clapton Nursery.

TORREYA MYRISTICA (CALIFORNIAN NUTMEG).—The SUBSCRIBERS have to offer strong healthy plants, three years from seed, of the above-named beautiful hardy Evergreen Tree. It is figured and described by Sir W. J. Hooker, in "Botanical Magazine" for May, 1854, to which the Subscribers refer their friends. Price on application.
HUGH LOW AND CO., Clapton Nursery, London.

CLARKE AND CO., WHOLESALE AND RETAIL SEEDSMEN AND FLORISTS, 86, High Street, Borough, London, beg to say they have imported a choice collection of DUTCH BULBS (which are not to be surpassed by any other house in London), and they will be happy to forward Catalogues upon application. Terms, cash, or a reference in London.

CHOICE SWEET WILLIAM SEED.—Any person wishing for good SWEET WILLIAMS can be supplied with half an ounce of seeds from an Amateur's garden, by sending six postage stamps, addressed to A. Z., Post Office, Louth, Lincolnshire. The proceeds to be given to the Irish Mission.

TO NURSERYMEN AND OTHERS.
WANTED, Fifty CEDRUS DEODARA, well grown bushy Plants, measuring not less than 3 feet high as they stand.—Address tenders, containing faithful description of Plants, and price, including package and delivery in London, to X. Y., Office of this Paper.

LARGE CAMELLIAS.
TO BE SOLD, about 30 large Camellias, of the best kinds. A gentleman leaving his present residence wishes to dispose of the above. The Plants are from seven to nine feet high, bushy, and full of flower buds. The price (which is very low) may be had on application to Messrs. FRASER, Lea Bridge Road Nursery.

RENDLE'S NEW AUTUMNAL CATALOGUE *of Geraniums, Camellias, Fuchsias, Azaleas, Chrysanthemums, Stove and Greenhouse Plants, &c., can now be had in exchange for two postage stamps.*
Apply to WILLIAM E. RENDLE & Co., Nurserymen and Seed Merchants, Plymouth.

TULIPS.
HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to inform the AMATEURS OF TULIPS that his CATALOGUE is ready, and will be forwarded by post on application. He is happy to say that from the superior growth of last spring, he has been enabled to make a considerable reduction in the prices.

AMERICAN PLANTS.
JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.
The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

THE PAST WINTER AND SPRING have induced YOUELL & Co. to publish a CATALOGUE of RARE and HARDY CONIFERS and HARDY ORNAMENTAL SHRUBS, that have proved with them perfectly hardy in this well-known bleak district, exposed to the cutting winds from the North Sea.
This Catalogue also contains an extensive selection of the most useful Greenhouse Plants, Camellias, Ericas, Epacris, Chrysanthemums, Hollyhocks, Tree Carnations, Carnations and Picotees, Fuchsias, Verbenas, Phloxes, &c., which will be forwarded (stamped) on receipt of two postage stamps.
YOUELL AND CO., Royal Nursery, Great Yarmouth.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.
They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.
Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.
Pine-apple Place, Edgeware Road, London.

AMBROISE VERSCHAFFELT, NURSERYMAN, Editor of the "Iconographie des Camellias," and "L'Illustration Horticole," begs to inform amateurs and the trade, that his new Catalogue for the present autumn is just published, and can be obtained *free* from his agent, Mr. R. SILBERRAD, 5, Harp Lane, Great Tower Street, London. A. V. begs to offer to the trade:
Fine DOUBLE CAMELLIAS, well set with bloom buds.
Fine AZALEA INDICA, do. do. do.
LILIUM LANCIFOLIUM, ALBUM, and SPECIOSUM (strong bulbs).
The 9th number of "L'Illustration Horticole," by A. VERSCHAFFELT contains:
DESMODIUM PAINEA SPINOSUM, ISMENE AMANCAES, CHORIZEMA SUPERBUM.—N.B. Price on application.

LILIUM LANCIFOLIUM, TRITONIA AUREA, AND VALLOTA PURPUREA.
HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to say that his extensive collection of the above BEAUTIFUL PLANTS is now in flower, and may be viewed every day (Sundays excepted). Admittance gratis.
H. GROOM begs to state that his CATALOGUE OF BULBS for this autumn is ready, and will be forwarded by post on application.

DUTCH BULBS.
THOS. CRIPPS, NURSERYMAN, SEEDSMAN, and FLORIST, respectfully announces that his annual importation of the above has just arrived in excellent condition, Catalogues of which, comprising, amongst others, many new and choice varieties of Hyacinth, Crocus, Tulips, Anemones, &c., may be had on application.—Tunbridge Wells, Sept. 16.

OMAR PACHA PEA.
W. NICOL, GARDENER, Roslyn House, Hampstead, begs to announce that he has put his incomparable Pea "Omar Pacha" into the hands of Mr. Sommerville, Landscape Gardener, Nurseryman, Seedsman, &c., for Sale, in sealed quarts at 10*s*. 6*d*., and pints, 7*s*. 6*d*. The above Pea is not only the earliest but the most prolific, and best flavoured hardy variety in cultivation. As the stock is small, he would recommend true lovers of a good Pea to make immediate application to Mr. Sommerville, as above.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s*. per dozen. The above bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place, London.

SPLENDID NEW CINERARIA "OCTAVIAN."
JOHN KER, FLORIST, Bristol Road, Birmingham, has the pleasure to announce that he will commence sending out Plants of this truly magnificent Cineraria in October. It possesses more good qualities than any other out, viz., a fine robust habit, continues longer in flower, commencing in December; it will continue through the whole winter, till May, to send up dense trusses of large beautifully scented flowers, filling the whole house with their odour; flowers large, colours well contrasted, petals pure white, tipped with purple, broad and well imbricated, disc dark. Has been awarded a first class certificate of merit by the Midland Floricultural Society, and pronounced by the judges then present a magnificent variety. Has been highly commended in No. 289 of the "Cottage Gardener."
Plants 10*s*. 6*d*. each, Post-office orders payable at Birmingham. Parties wishing early attention will please give their orders. Many have been received, and will be sent out in rotation.

NEW CLIMBING HYBRID PERPETUAL ROSE, THE "DUCHESS OF NORFOLK."

To be sent out for the first time about the end of October.

WM. WOOD AND SON have much pleasure in offering the above superb Rose to the notice of their Friends, feeling assured it will prove entirely distinct from any Rose at present known, and which cannot fail to give every satisfaction. The colour is a bright vivid crimson, the under side of the petals most delicately shaded with a fine glossy pink, presenting a pleasing contrast; but the most valuable property of this superb variety consists in its extraordinary vigour, and as a perpetual-flowering dark-coloured Climbing Rose surpasses any variety that has yet been offered.

Standards, Half Standards, or Dwarfs will be supplied at 10s. 6d.

N.B. A very liberal allowance to the Trade.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

NEW HARDY CONIFERS.

HUGH LOW AND CO. announce to their friends and the public that they have been appointed by Messrs. Parsons & Co., of Flushing, New York, Sole Agents in this country for the sale of the undernamed CALIFORNIAN CONIFERS. The Plants are raised from seed, and will be delivered as soon as the growth of the present season is sufficiently matured. THUJA GIGANTEA (Nuttall); *synonyms* LIBOCEDRUS DECURRENS (Torrey); THUJA MENZIESI (Douglas); THUJA CRAIGIANA (Jeffreys).—A magnificent species, and the most desirable Tree known to exist in California. It was discovered by the botanists of the United States Exploring Expedition, and is described by Professor Torrey, in "Plantæ Fremontianæ," as growing near the upper waters of the Sacramento, from lat. 38° 40' to 41° N. He also states it is a noble tree, attaining a height of 120 to 140 feet, with a trunk 7 feet in diameter, rising from 80 to 100 feet without a limb. This tree will be perfectly hardy, and will take the foremost rank amongst our ornamental trees, as the foliage is most beautiful, reminding an observer of some of the more graceful species of Lycopodium.

The Plants when delivered will average 1 foot to 1½ foot in height, and being of such unusual size for a new Conifer, will produce an immediate effect. Price 31s. 6d. each.

ABIES NOBILIS.—This well-known Fir requires no description. Plants from seed have long been desiderata, and those now offered are strong and well shaped, from 6 inches to 1 foot in height. Price 31s. 6d. each.

In addition to the above, H. L. & Co. have to offer from the same source strong Plants of several species of hardy CALIFORNIAN PINES, collected in districts little explored. Amongst them will be found Pinus Jeffreyana, Pinus Parryana, offered for the first time; and judging from the CONES of the different species, it may with certainty be inferred that several others will prove entirely new to this country. Price 84s. per doz.

Messrs. Parsons & Co. having been successful in raising these fine Conifers in considerable numbers, have determined on offering them at the low prices quoted above, with a view to insure their speedy introduction into every collection in Europe.

Discount allowed only when twelve plants of a sort are taken.

Clapton Nursery, London, Sept. 16.

FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

CHRYSANTHEMUMS, LILIPUTIAN AND LARGE FLOWERING.—Large and remarkably fine Plants of all the best Sorts, in 32-sized pots, fit to make really good Specimens at once, at 18s. per dozen; smaller Plants, in 48s, to flower in the coming winter, at 8s. per dozen.

VERBENAS.—All the new Varieties let out by Smith, Bragg, Mockett, and others, in 1854, at 8s. per dozen; older Varieties, 6s. per dozen—all well established.

FAIRY AND FABVIA ROSES.—Large healthy Plants, in 48s, at 8s. per dozen.

SEEDLING HERBACEOUS CALCEOLARIAS, AND SEEDLING CINERARIAS, at 5s. per dozen in October. These Plants have been raised from the Flowers which were so highly admired at this Nursery during last season.

FRENCH SPOTTED OR NEW FANCY GERANIUMS.—Well-established Plants of these beautiful Flowers, at 2s. 6d. each, or 25s. per dozen, in October next—a large consignment (including all the best raised in France, several of which have not been seen in England) having been just received at the Floral Nursery.

An immense stock of nearly all the new and best Bedding GERANIUMS, FUCHSIAS, HELIOTROPES, TROPÆOLUMS, and other Soft-Wooded Plants, always on hand, at prices equally low.

The Stock of SHOW and FANCY GERANIUMS at the Floral Nursery is unquestionably the largest and best in the kingdom, no expense having been spared to render it perfectly unique; all the new plants of the best raisers are added as they appear. Well-established plants of upwards of 1000 sorts may be had early in October next, at prices which will place competition at defiance.

The trade fairly and liberally dealt with, and all plants sent out will be warranted true to name.

A remittance or satisfactory reference indispensable from unknown correspondents. Catalogues forwarded gratis.

JOHN WESTWOOD, PROPRIETOR.—Sept. 16.

JAMES IVERY AND SON, NURSERYMEN, &C., Dorking and Reigate, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEA INDICA and RHODODENDRON PONTICUM COCCINEUM, which will be ready for delivery in October next. The Advertisers beg to say they can recommend them with the greatest confidence as being superior to any others of their kind. The Azaleas were figured in the "Florist" for July, 1852, at which time the editor remarked as follows:—"As regards the beauty of the flowers little need be said, as the representations will speak for themselves; they have been much admired, and will, no doubt, speedily find their way into every collection." Again, in the same journal for June, 1854, the editor says:—"Your two Azaleas, Admiration and Criterion, are certainly very beautiful, and fully maintain the opinion expressed of them, at page 137 volume for 1852, when we figured them." Criterion is a very fine bold flower; size, shape, and habit of that old favourite Iveryana; colour, light salmon, distinctly margined with white, and thickly spotted with deep crimson on the upper petals; 21s. each. First-class Certificate at the National, April 20, 1854—the only time it has been exhibited since it was figured. Admiration is a medium sized flower, of greater substance than the former, with the same shape and habit; colour pure white, with broad flakes of carmine, resembling the marking of a Carnation; 21s. each. Has not been exhibited since it was figured, owing to an accident to the flowering plant.

RHODODENDRON PONTICUM COCCINEUM.—This is the finest crimson variety ever offered to the public; it is a free bloomer, with a fine large truss of brilliant crimson, being brighter than the old Arboreum, and perfectly hardy. Dr. Lindley, in this journal (page 342), says:—"This fine variety has the deep crimson flowers of the red tree Rhododendron, which was evidently one of its parents, and the foliage of R. ponticum, which it resembles in all respects except in colour—thus uniting the brilliant flowers of the tender Indian kind with the hardy vegetation of the Black Sea." 21s. to 63s. each. Has received three Certificates of Merit. A few extra-sized plants of both Azaleas at 42s. each.

The above have been ordered by most of the principal nurserymen, and many of the nobility and gentry.

N.B. Figured Plates of the two Azaleas may be had by enclosing nine postage stamps to either of the above-named Nurseries. A remittance, or reference, is respectfully requested from unknown correspondents.

Reigate Nursery, September 16.

DUTCH FLOWER ROOTS.

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth, have just received, direct from one of the first establishments in Holland, a very large assortment of

DUTCH FLOWER ROOTS,

comprising all the best varieties of Hyacinths, Tulips, Ranunculuses, Anemones, Gladiolus, Iris, Liliums, Crocus, Ixias, and all other kinds of Flowering Bulbs.

They are all come to hand in most excellent condition, and will insure satisfaction to all purchasers.

COLLECTIONS OF FLOWERING BULBS.

No. 1. A Selection of all the most approved sorts for a large garden	£3	0	0
No. 2. A Selection, in smaller quantities	2	0	0
No. 3. A Selection, for a small garden	1	0	0

These Collections have given the greatest satisfaction to all who have had them, and can be recommended with the greatest confidence.

All Orders for Roots above 2l. Carriage paid to any station on the South and Western Railways, and above 5l. to any station in England.

CHRYSANTHEMUMS.

JOHN CLARK begs to offer a large collection of all the best varieties of the above, both large flowering and Lilliputian kinds; fine strong bushy plants to flower this autumn, at from 6s. to 12s. per dozen.

Also a large number of fine, compact, grafted plants of EPIPHYLLUM TRUNCATUM for winter flowering, many of them fine specimens in 8-inch pots, 2 feet high, and exceeding 6 feet in circumference, in splendid condition, from 5s. to 15s. each.

Also a first-rate collection of PELARGONIUMS, FUCHSIAS, VERBENAS, &c.

Belle Vue Nursery, and 58, High Street, Cheltenham.

EARLY DWARF SEED POTATOES.

ABRAHAM HARDY AND SON'S Ten selected earliest varieties of SEED POTATOES are now ready to send out, warranted free from disease. Retail and trade prices on application.

Also their improved BATH COS and Hardy HAMMERSMITH LETTUCE SEED, growth of 1854. Six-pennyworth of these, or other seeds of Cauliflower, Flower Seeds, &c., for September sowing, will be sent to any address, post free, on receipt of 6d., or six stamps. Price per pound to the trade, on application.—Maldon, Essex, September 16.

NEW CINERARIAS.

ROBERT REA begs to announce that he will send out, the first week in October, the following New CINERARIAS, and, from their first-rate character, and being unequalled by any yet sent out, he feels confident they will give universal satisfaction.

IPSWICH BEAUTY (REA'S).—Clear white, deeply edged with lake, shaded with purple; very dark disc, full size; broad petals, slightly cupped. A fine exhibition flower. First Class Certificates were awarded at Ipswich and Colchester, the only places where it was exhibited. Pronounced by all who saw it to be the finest Cineraria ever exhibited. Plants 10s. 6d. each.

GEM (PARKER'S).—A self-coloured flower; beautiful puce, with light disc; quite novel in colour, and a very striking first-rate variety. First Class Certificate, Ipswich, 1853. Plants 7s. 6d. each.

In consequence of having only one plant of the first to propagate from, the stock is very limited, early orders are therefore respectfully solicited, which will be executed strictly in rotation as received. The usual discount to the trade, and one sent over when three are ordered.—Ipswich Nursery, Ipswich. Sept. 16.

"OMAR PACHA" STRAWBERRY.

WILLIAM JAMES WARD is now sending out well rooted plants of the above excellent Strawberry, which was awarded a Medal by the judges at the Royal Botanic Gardens Exhibition, July 5th, 1854. It has also been submitted to Mr. Marnock, Mr. Spencer, Mr. Thompson, and several practical gardeners, who have all pronounced a favourable opinion of it. Also by Mr. Powell, of the Royal Gardens, Frogmore, in the descriptive list of new Fruits, in the "Florist and Fruitist" for the present month, accompanied with a woodcut.

	£	s.	d.		£	s.	d.
100 plants ...	3	0	0	25 plants ...	1	0	0
50 " ...	1	15	0	12 " ...	12	0	

Prospect Hill, Reading.—Sept. 16 1854.

CHARLES TURNER begs to offer very choice SHOW GERANIUM SEED, saved from the best sorts, 2s. 6d. per packet.

	Pr pkt.
Very choice FANCY GERANIUM SEEDS	2s. 6d.
Do. do. CALCEOLARIA, from some splendid flowers	2 6
Do. do. CINERARIA, extra good quality	2 6
Do. do. PRIMULA SINENSIS, first quality ...	2 6

The new Autumn List of Pelargoniums, containing all the new varieties raised by Mr. Foster, Mr. Hoyle, and others, and to be sent out by C. T., is now ready, and can be had on application.

The Autumn List of Hollyhocks, Carnations, Picotees, Pinks, Pansies, Cinerarias, &c., will shortly be ready. A full collection of Hyacinths and other flower roots. Lists sent on application.

Royal Nursery, Slough, Sept. 16.

TO PLANT GROWERS, NURSERYMEN, AND OTHERS.

WANTED, a few fine Large PLANTS of the undernamed, not less than 8 feet high, or any other good Greenhouse Plants not named below.

Banksia grandis	Edwardsia, sorts
" latifolia	Telopea speciosissima
" coccinea, &c.	Orange trees
Calothamnus, of sorts	Lemon, &c.
Poinciana Gilliesii	Sparmannia africana
Pittosporum, sorts	Beaufortia decussata
Enkianthus reticulatus	Pimelea lanata
" quinquiflorus	Luculia gratissima
Lambertia formosa	" Pinceana
Grevillea, sorts	Dryandria, sorts
Eucalyptus, sorts	Cunonia capensis
Burchellia capensis	Hovea Celsi
Brugmansia, sorts	Myrtles, sorts

Any one having any of the above to dispose of may hear of a purchaser by stating the names and price, and any of the particulars to A. B., to the care of Mr. Thomas Goodwin, Helmsley Place, Hackney, London.

NEW BULB CATALOGUE.

E. G. HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, will be happy to forward, post free, on application, their NEW BULB CATALOGUE for this season, containing a choice selection of Dutch and other Flower Roots. They would draw particular attention to the Hyacinths, no other varieties but those which they have proved in their nursery as possessing the best properties for which this tribe is admired, such as brilliant colours, large close truss, and good habit (the Dutch growers offer such a number of useless cheap varieties that great disappointment is caused unless a good selection is obtained). Among their Miscellaneous Roots they would mention their choice and extensive stock of Gladiolus, and section 3, the Hybrids of Gandavensis, they can highly recommend, particularly "Couranti fulgens," "Fanny Rouget," and "Monsieur Blouet," as most deserving of notice.—September 16.

NEW AND SPLENDID PETUNIAS.

T. ANSELL begs to announce that he intends sending out, the first week in October, the following new and splendid Petunias, viz.:—Mrs. Beecher Stowe, Uncle Tom, Eva, and Aunt Chloe, they have been very generally admired by all parties who have seen them, and from their novel and splendid colours (crimson and rose, of various shades, beautifully edged with green), have been pronounced unique. Price 3s. 6d. per plant, or the collection of four varieties for 10s.; discount allowed where three sets are taken. The stock being limited, early orders for them are respectfully solicited. An extensive collection of Geraniums, Chrysanthemums, &c.; also a quantity of strong Passiflora Mayana, at two guineas per 100.

Camden Nursery, Camden Town.

STRAWBERRIES.

WILLIAM NICHOLSON is now sending out strong well-rooted Plants of his four new and distinct Strawberries, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy; RUBY, ditto, a great bearer, and forces well; CAPTAIN COOK, market fruit, large, and a great bearer; FILLBASKET, ditto: 400 Plants of the above sorts for 2l.; 200 do., 1l. 4s.; 100 do., 15s.; 50 do., 10s.; box included. Most of the old and new sorts can be supplied.

*** See Mr. J. W. KINMONT'S remarks on the above Strawberries, printed in No. 31, 1854, page 501, of this Paper.

Post-office Orders, payable at Yarm, Yorkshire, or a cash remittance required with the order.

Egglescliffe, near Yarm, Sept. 16, 1854.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50s.; 50, 30s.; and 25, 16s. Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5s. per 100.

Manor Farm, Deptford, September 16.

MAY'S IMPROVED EARLY ASH-LEAVED KIDNEY POTATOES FOR SEED.—For autumn and early spring planting the above are the best variety of Ash-leaved Potatoes known; the following opinion of them is from a party who has grown them for some years, and is selected from a number of favourable opinions of them:—"I can truly say, from a number of years' experience in growing them, that I never met with any Potato to equal them for cropping and sale." —*George Keynon, Market Gardener, Brierley, near Wakefield.*

Price per bushel, 10s.; per cwt., 14s.; per ton, on application to HENRY MAY, the Hope Nurseries, Bedale, Yorkshire.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.

It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 11s. per ton; ditto, delivered 5 miles, 16s. per ton. Loam and Peat at moderate prices.—KENNARD BROTHERS, Swan Place, Old Kent Road, London.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the Crystal Palace, Sydenham, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. Conservatories and Aviaries fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. Window blinds of every possible description, of the very best materials and workmanship.

N.B. An allowance to nurserymen and the trade.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON AND BUILDER, PIMLICO MARBLE AND STONE WORKS, Belgrave Wharf, Lower Belgrave Place Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

ENCAUSTIC TILE PAVEMENTS.

MAW AND CO., Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "THE SUCCESSFUL IMITATION OF OPY'S ALEXANDRINUM, IN THE BEAUTIFUL ENCAUSTIC TILE PAVEMENT OF CLOISTERS OF BYZANTINE COURT," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.

Specimens at 11, Aldersgate Street, City.

SHEEPFOLDING NETS.—Cocoa Nut Fibre, or Hemp square mesh Sheepfolding Net, of superior quality, 4 feet high, 4d. per yard; ditto of a much stronger description, 6d. per yard. Netting for Lamb Fencing, 3-inch mesh, 4 feet high, 6d. per yard. The Cocoa Nut Fibre is the lightest and most durable article made, and was approved of by the Bristol Agricultural Society. The 3-inch mesh makes good Poultry Fencing.—WILLIAM CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, Islington, London.

DUTCH FLOWER ROOTS.

PETER LAWSON AND SON, of Edinburgh, Seedsmen and Nurserymen to the Queen, beg respectfully to acquaint their customers and the Public that they have now opened a place of business in London for the convenience of their English correspondents, and will be prepared to execute orders of every description there. They have just received a supply of DUTCH FLOWER ROOTS, consisting of all the esteemed varieties, of which Catalogues may be had on application, and for which they solicit early orders.

London, 27, Great George Street, Westminster, Sept. 16.

EARLY SHORT-TOP ASHLEAF, for Autumn or Spring Planting.—This "Stock" cannot be excelled. Having been carefully preserved, they will be warranted free from disease; they are remarkably fine in quality, and prolific in yield. Price 30*s.* per sack of 2 cwt. This includes the sack and carriage paid to London. All orders must be accompanied with a remittance, and letters of inquiry with a stamped envelope.—Address JOSEPH WILSON, SEED POTATO MERCHANT, Ipswich.

P.S. Two new varieties, named the "Early Ranger" and "Lackford Kidney," will be shortly ready to send out.

HOLLYHOCKS.—A collection of this fine old English flower, grown at the Cheshunt Nurseries, is now in bloom, and there will be a succession till the end of October. Admirers of the Hollyhock are respectfully invited to visit the Nurseries to inspect them. In addition to the choicest varieties of other growers, there are many rare and beautiful kinds of their own production, and to be seen only at their grounds.—A. PAUL & SON, Nurseries, Cheshunt, Herts (13 miles from London, on the Cambridge line of Eastern Counties Railway).

CHOICE NEW CINERARIAS, FUCHSIAS, &c.

WILLIAM RUMLEY AND SONS are now sending out the following first-rate new CINERARIAS, at 18*s.* per dozen, 6 for 10*s.*, or 2*s.* each, or, if left to our selection, 12*s.* to 15*s.* per dozen, viz.:—Advancer, Constellation, Estelle, Etoile de Vaise, Garland, Empress Eugenie, John Bull, Lord Stamford, Lablache, Lady Camoys, Mrs. Beecher Stowe, National, Nimrod, Novelty, Polyanthiflora, and Scottish Chieftain. Good show varieties, 6*s.* to 9*s.* per dozen.

FUCHSIAS, all the best new varieties of 1854, 12*s.* to 15*s.* per dozen.

VERBENAS and PETUNIAS, all the best of 1854, 9*s.* per doz.

PANSIES, extra fine varieties, 6*s.* to 12*s.* per dozen.

CHRYSANTHEMUMS, strong blooming plants, 12*s.* per doz.

The above will be forwarded immediately, in fine healthy plants, hamper included, or free by post on receipt of a post-office order payable at Richmond.

A Descriptive CATALOGUE of the above may be had on application.—Gilling, Richmond, Yorkshire.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 16, 1854.

THE remarks we made last week upon the EFFECTS OF THE WINTER are, we are happy to see, likely to elicit some important criticism. For this we shall be greatly obliged; the writers will consult the best interests of horticulture by communicating fully the result of their experience, and by correcting the conclusions to which insufficient evidence may have possibly led us. To such criticisms we shall carefully address ourselves hereafter; in the meanwhile we proceed to consider the facts belonging to the more important non-Coniferous races.

It must be regarded as hopeless to grow *New Holland Acacias* out of doors with any prospect of permanent success. Here and there, in very warm districts, they may live, but all these are exceptional cases. Even *A. dealbata* and *affinis*, the hardiest of the race, were all but killed in the southern counties. The Persian *A. Julibrissin*, however, took little harm at Kew, and is no doubt quite hardy wherever the wood can ripen.

Among SYCAMORES the Nepal *A. villosum* seems to be tender; *A. palmatum* is more hardy; and the Acers *caudatum* and *circinatum* may be regarded as secure.

ARALIAS, with their magnificent foliage, seem to rank in hardiness with Fuchsias.

Among ARBUTUSES it has been found that *A. Andrachne* is not so hardy as has been expected. This Crimea plant was totally killed in some places, and even its Oregon form, *procera*, had the edges of its leaves destroyed at Chiswick. It is, however, evidently more capable of bearing cold than *A. Unedo*, and may be regarded as fit for plantations anywhere south of the Trent.

Some BAMBOOS, such as that from the Himalayas, although killed to the ground, have sprung up freely upon the return of warm weather. There is, however, only one northern case recorded, and that is at Oulton, in Cheshire, where the plant is reported among the killed; at Liverpool, which is milder, it was only cut to the ground.

BENTHAMIA is shown conclusively to be unfit for the winters of the midland counties. Even at Osborne it does not thrive, and it can only be regarded as suitable for such a mild damp climate as that of Cornwall.

The important race of BERBERRIES generally bore the weather well; even the Mexican *trifoliata* sustained no injury at Chiswick against a south wall, although it perished in the open ground. *B. nepalensis* was damaged in its foliage, but more from wind than cold; and we feel justified in believing that this noble species will bear our winters in places well sheltered from wind, and not too much exposed to sun. About the Chinese and Japanese Berberries we have no sufficient intelligence, and they remain for further experiment; it, however, seems evident that *B. Fortuni* is not so robust as was expected. Above all, it is important to know, as we now do, that *B. Darwini*, the most beautiful of all the species, will become a thoroughly domesticated plant. Southampton, Exeter, Bagshot, Chiswick, Shiffnal, and Congleton, all declare its hardiness; we can also report, from our own observation, that the species thrives equally in a wet place and on the face of a dry bank exposed to the sea, as at Osborne.

BUDDLEAS are no hardier than Fuchsias.

The New Holland genus CALLISTEMON seems likely to take a place among hardy shrubs; and if so, there will be none to eclipse it. At all events C. salignum was scarcely touched at Kew, and we know that, with only such shelter as a glass wall affords, the *C. lanceolatum* bore the winter perfectly at Chiswick. The possessors of these plants would do well to turn them out of doors generally next year.

CAMELLIAS bore the cold wherever they are reported on, with the exception of *Sasanqua*, which died on an east wall at Kew; it is true that they are returned as having suffered considerably at Singleton, near Swansea; but it is certain that this arose from local causes, and not from cold.

The CANTUAS must, we fear, be wholly excluded from hardy shrubs.

CERASUS ILICIFOLIA, an evergreen from California, whose hardiness no one doubted, proves to be much more tender than the Portugal Laurel, and only fit for very good climates.

Of CEANOTHES, the only quite hardy ones have proved to be *C. integerrimus* and *verrucosus*, whose character may be regarded as established; *cuneatus, rigidus, azureus*, and *papillosus* can only be regarded as safe, even in the southern counties, when trained to walls.

Of the Indian species of CLEMATIS, *nepalensis* is the tenderest; all the other newly-introduced kinds lived when trained to south walls.

Of THORNS, the Chinese *C. Layi*, and the Nepal *C. crenulata*, escaped against walls, where *C. mexicana* was much injured; but the trial has been insufficient.

No result has been more satisfactory than the establishment of the complete hardiness of the CHUSAN PALM, where it was tried; Kew, Chiswick, Bagshot, and Osborne, as well as South Devon, attest its fitness for the climate; and we may add that, in the trials which have been made, there is not one symptom to the contrary. Being a native of Chusan, where Mr. FORTUNE found it on hillsides, it might have been expected to be as hardy as the Glycine sinensis, which comes from the same place. But, on the other hand, Palms are so universally tender—even the Palmetto of Italy detesting our English winters—that it was supposed that this would possess the constitution of its order. Such is not the case. While at Chiswick the *Chamærops humilis* was much cut at the foot of a south wall, in a dry border, this plant resisted the frost on a cold, north bank, in a hollow below the general level of the garden. Here, then, we at last possess the means of varying the landscape of these islands with one of the most peculiar forms of vegetation of the tropics. In his wanderings Mr. FORTUNE speaks of it as a Palm *tree* cultivated on the hill sides of Chusan, as well as in similar situations all over the province of Chekiang, for the sake of a strong fibre obtained from its floral leaves (bracts), which also yield materials for the manufacture of garments and capital hats. What species of Chamærops this may be is, we believe, still uncertain. It is, however, supposed to be the same as the Himalayan *C. Martiana*, which Dr. HOOKER tells us ascends to 8000 feet in the Western Himalaya, where it is annually covered with snow; a fact which explains the hardiness of the plant in Europe, and which we submit to the consideration of our geological friends, who think that Great Britain *must* at one time have enjoyed a tropical climate, *because* remains of Palm trees occur in our coal fields.

The further consideration of this subject want of space compels us to postpone for a week or two.

IN our number for July 28, 1849, we published some observations on the DISEASES OF HOPS, which we had then an opportunity of studying in the neighbourhood of Maidstone. It appeared that the diseases, though known under various names, were mere modifications of two only, and for each of these we suggested a probable remedy.

A visit to the same district last week afforded us the greatest gratification, inasmuch as we found that, thanks to Mr. WYKEHAM MARTIN and Dr. PLOMLEY, the seed of 1849 had fructified, and that there is really a prospect in the course of a few years of both the diseases being greatly under the control of the cultivator. As regards that which depends upon the presence of aphis, the existing high duty upon tobacco, and consequent enormous price, has prevented any very general experiments; but we have seen an extensive Hop-ground, belonging to Mr. ELLIS, consisting principally of the variety called COLEGATES, in which a solution of tobacco and soft soap has been used by means of an engine at a considerable expense, and evidently with great benefit.

In Sussex and in many parts of Kent, the plants have been so much injured by aphis, that there is absolutely not the slightest attempt to produce bur in hundreds of gardens. About Maidstone, however, though the Hop-flies were unusually abundant, many of the plants recovered, and gave out vigorous shoots with a prospect of a good harvest. Indications of mould, however, soon appeared, and in many instances the blight has advanced so rapidly as to destroy all hope of a remunerating produce. The mould was at first confined principally to the young bur, and indeed has never spread much upon the leaves, so that, except to very close observers, its presence was not suspected till it was almost too late to check its progress very materially.

We have, however, now before us specimens of GOLDING'S, which is the finest and most delicate variety, from Leeds, to which sulphur was applied by Mr. ERSKINE, from the 18th to the 20th of July, when the mould first made its appearance, and others from the same ground which were undressed, the former of which are in admirable health, and will afford ample remuneration, while the produce of the others will be extremely small, and of a very inferior quality. The difference, indeed, in the specimens is at once obvious to the most common observer, as it was equally *in situ*, where the eye could detect to the greatest nicety what plants had been dressed, and where they had been accidentally or designedly neglected. In the next parish to Leeds, in the grounds above-mentioned in which tobacco had been applied, the state of health and luxuriance was still greater, though in a Hop of inferior quality, and the beneficial effects of sulphur were to a greater or less extent visible at Maidstone and in many intermediate gardens, in which the variety called GRAPES and the two other varieties were cultivated. In a few cases, indeed, where no sulphur had been applied, there was a tolerable crop, especially of the variety called JONES'S; but where nothing had been done the crops were in general, to a great extent, if not completely, eaten up with mildew.

In practice it is found that the easiest, most economical, and at the same time the most effectual mode of applying the sulphur is by a common dredging box at the end of a long pole. Little at present has been done with solutions, but we should strongly recommend the trial of GRISON'S mixture,* especially in the later stages of disease, as more speedy in its action. In all cases, however, the grand point is to watch the first indications of the mould, and to apply the remedy at once.

In the course of our rambles lately, through the Hop grounds near Maidstone, certain peculiarities in the growth of the Hop mildew suggested themselves, which seem worthy of being recorded. The first thing which struck us was, that the crops were attacked by the mould exactly in proportion to their height. On JONES'S, for instance, which require very short poles, there was very little mildew, while the GOLDINGS on their poles of 13 feet or upwards were in great measure destroyed; at least, where no sulphur had been used. The state of the GRAPES and COLEGATES was exactly intermediate between the two. Now, this is quite in accordance with the experience of Vine growers. The Vines on trellises are far more subject to mould than those on short stakes. Some of the Hop growers seem to recognise this fact in the notion that weeds are useful in keeping the mould low; but this probably arises from the circumstance that such weeds as the common Groundsel are extremely subject to a kind of mildew, which in outward appearance closely resembles that of the Hop.

A second point was that the mould was principally confined to the bur, and very rare upon the leaves, a fact which may have prevented all but very close observers being aware that mildew really commenced its attack some weeks before its prevalence was generally recognised. The cultivator, then, must watch the bur as soon as it makes its appearance, and apply the sulphur at once, if he hopes to do much good. The mould may not appear upon the leaves till the injury is irreparable.

A third point worthy of remark was, that although the mildew on the leaves remains for weeks in the form of an Oidium, without producing a single

* One pound flowers of sulphur and an equal volume of fresh slaked lime are to be boiled for 10 minutes in an iron pot in five pints of water, so as to give four pints of clear solution. This is to be mixed with 100 parts of water or to such other strength as may be found most efficacious, and applied with an engine. See *Gardeners' Chronicle*, 1852, p. 419.

sporangium or pycnidium,* while on the young bur, which when attacked at an early period of growth never arrives at its full development, it immediately produces its fruit so as to discolour the bracts, and ultimately, in combination with the exhaustion consequent on its presence, to produce the appearance known by the cultivators under the name of red rust.

Still a fourth peculiarity was exhibited by the fact, that the mould was spreading like wildfire in extremely hot weather, and under a very dry atmosphere; the nights, however, from radiation, being rather cold, and sometimes within a few degrees of freezing, and from the same cause attended by a copious deposit of dew. Meanwhile, the Botrytis, which was attacking the neighbouring Potatoes, could scarcely hold its way, though abundantly present on the green borders of the brown spots upon the leaves, which crumbled under the fingers into dust. The Hop bine, however, when divided, dripped with moisture, while the Potato haulm was almost dry, and their respective parasites were not, therefore, equally dependent on atmospheric moisture.

It is curious, moreover, that though the joints of the Oidium in the Vine readily germinate, in the Hop mildew it seems to be the grains within those joints which are fertile. Dr. PLOMLEY has taken great pains to ascertain this, and has shown us specimens in which the granular matter of the joints first separated into four distinct masses, and these again divided and subdivided, and as we believed germinating *in situ*, and finally protruding beyond the mother cell, and becoming entirely free on its absorption.

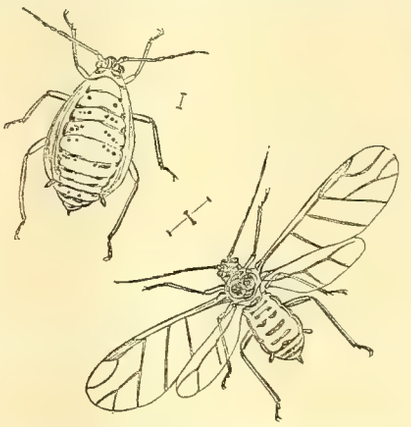
As the Hop mildew was daily on the increase, and the estimate of the ultimate harvest daily diminishing, we could not help suggesting the immediate securing of the Hops which did exist upon the bine. This proposition, however, was met by the supposed injury done to the bines from bleeding by early division at the base. We are inclined to think that the consequent weakness is much overrated; but even supposing this to be as great as is imagined, the flow of sap might probably be easily staunched by the application of a little acid, or possibly of collodium to the divided surface, which might be done almost as quickly, by an intelligent lad, as the several poles are removed for picking. *M. J. B.*

THE uprooting of fallacies being the first step in the road to the attainment of truth, we thought it advisable in a late Number to notice the false conclusions which have been attached to some *ordinary* phenomena of insect life observed at *extraordinary* (choleraic) periods. The most widely spread of these erroneous ideas is certainly that connected with the swarming and migrations of aphides; and having received numerous specimens of Aphis Brassicæ from the north of England (observed in swarms concurrently with the outbreak of the cholera in those particular parts of the country) we have considered that it would be further useful to give a magnified figure of this species (copied from a drawing by Mr. CURTIS, published in the Journal of the Royal Agricultural Society) with a few notes on its economy, showing what are its real habits, and that its swarming has no connection with the prevailing epidemic beyond the fact that the latter happened to break out last year just at the period when the ordinary migratory swarms take place.

The disease in question has, however, sometimes made its appearance at other periods of the year, and of course unattended, at such times, by the swarming of the aphides, a circumstance of itself sufficient to disprove the charge raised against the insects, which have enough, as it is, to answer for. A further observation may be made, not only upon this particular charge, but equally bearing on others of a similar nature, in which it is asserted that particular results are produced by the agency of particular insects, fungi, &c. To support such a charge it is necessary to prove not only that the appearance of the insects or fungi in question has always been accompanied by the results observed; but also that the results themselves have never been produced unless accompanied by the appearance of the insects, &c. If, indeed, it could be shown that the insects, &c., in question had never before been seen, and consequently might be assumed either to be fresh importations or even new creations, there would be better grounds for the charge; but the natural result of our argument at once overthrows the charge whenever, as in the case of the Potato blight or the cholera, effects have been attributed to well known insects which have never before been accompanied by similar results.

The particular species of aphis in question infests the Cabbage and Swedish Turnip, the latter especially being subject to its attacks, "the under sides of the curled leaves being sometimes densely covered with them of all sizes; the old wingless females are seen resting in August, September, and October, surrounded by their young broods, with here and there a winged male, walking lazily over his kindred." Mr. CURTIS has further observed myriads of this species under Cabbage leaves in July, and secreted in the leaves of the crumpled Broccoli, as late as the end of November, when they were of all ages and sizes, both winged and apterous.

Of course the period of swarming varies not only in different species but in different seasons; a creature so delicate in its structure as the aphis is necessarily very susceptible to atmospherical changes, and it is also owing to these variations that differences take place in the numbers of winged specimens which are developed. Entomologists are also well aware what striking effects upon insect life are



produced by electrical changes in the atmosphere; a hot lowering state of the weather accompanying the approach of a thunder-storm being especially favourable to calling insects into full activity. Hence it is at an earlier period of the year, when electrical storms are more frequent, that the Bean aphis often swarms to an equal extent with the A. Brassicæ and its allies in autumn. It is this species, we believe, to which the name of "smother fly" has from this circumstance been applied. *J. O. W.*

VEGETABLE PATHOLOGY.—No. XXXVII.

163. Since the diseases of plants are for the most part dependent on chemical changes in their component parts, and since such changes are intimately connected with, if not in themselves electrical phenomena, it will at once be readily conceived that electricity is capable of exercising important, though in many cases possibly inappreciable influence on vegetation. As the earth and atmosphere are for the most part in different states of electricity, there must be constantly an interchange between the plants and the air, and the currents will be in different directions according as the air is charged with positive or negative electricity; and it is probable, *à priori*, that as, in its usual condition, the air contains positive electricity, the chemical processes will be promoted by the consequent direction of the current, as in a contrary condition they would be retarded.

164. The destructive effects of lightning on plants is too notorious to admit of question. The largest trees are shivered, partly by mechanical agency, and partly by the sudden expansion of gaseous matter,* and death is often the consequence, as it is from the shock of a powerful battery. The effect of a sudden fall upon the vegetative powers of partially dried yeast has often been recorded, and that instant death should, in some cases, be the consequence of a severe electric shock, even though the individual cells may not be separated, seems not more wonderful than that similar effects should take place from the same cause in animals, even taking into consideration the higher attributes of animal organism. Many cases, however, of apparent sudden death in plants are referred to electricity where the cause is altogether different, as the withering of branches in trees suffering from gumming, where life has been sustained for a long time by a mere thread of living tissue, or where plants have been destroyed by the attack of the spawn of fungals at their roots, or of insects devouring the young pith, as in the common Currant. In such cases the cause has been present, and actively engaged, for a long time, though the ultimate effect may appear almost momentary.

165. It has been observed that vegetation is sometimes more than usually active during thunder-storms, and it is pretty certain that an atmosphere highly charged with electric fluid, probably from the formation of nitric acid in the atmosphere, is favourable to the development of certain fungi, the spawn of which scarcely produces fruit under any other combination of atmospheric conditions. These effects, moreover, are not attributable to the mere quantity of rain which may have fallen, or to any increased quantity of free moisture in the atmosphere, because such conditions, unaccompanied by electric action, are not observed to lead to the same consequences.

166. As in the case of all other agents, the effect of which is difficult of exact appreciation, differences of electric condition have been confidently appealed to as capable of producing prevalent diseases. The ravages of Asiatic cholera and influenza have accordingly been referred to this source, as have the diseases which have been of late so active in the vegetable world, as in Potatoes and Vines. As such opinions, however, do not rest, or pretend to rest upon a single well ascertained fact, but are merely conjectural, they cannot be regarded as more than mere theories, however possible it may be that peculiar electric conditions may be absolutely necessary for perfect health. Till, however, we know what those conditions are, and what effect any alterations in them are capable of exercising, it is quite vain to attempt to build anything capable of proof upon foundations so utterly without stability.

167. Great interest was excited some 10 years since by a statement of the important results which had arisen from the isolation of portions of crops by means of wires, so as to subject them to more powerful electric agency. Experiments with a view to prove or disprove this were undertaken by various persons, as at the Royal Botanic Garden at the Regent's Park, and on a more extensive scale at the gardens of the Horticultural Society at Chiswick. A full account of the latter, by Mr. Solly, was published in the first volume of the Horticultural Transactions, p. 81, together with much historical matter,* and the result of the experiments was, upon the whole, opposed to the supposition of the great influence of electricity on vegetation, or tended at least to show that the electrical effects produced by such apparatus as those described have very little if any influence on the growth of plants; and from these and other experiments made during the past year, Mr. Solly adds, I am led to believe that a great part, if not the whole, of the effects recently described as electrical are accidental or due to adventitious causes. Experiments with a view to diminish the quantity of electricity, it should be observed, led to no more positive result than those which had in view its increase. *M. J. B.*

CULTIVATION OF THE STRAWBERRY.

UNTIL within the last 30 years but little attention was paid to the cultivation of this fruit, and not above five or six varieties were known; the largest of these was the Hautbois, so called from being originally found in the high *bois* or woods of Bohemia. Till lately Keens' Seedling ranked first, as an early Strawberry, both for bearing and flavour; and Myatt's British Queen as a later crop. To the cultivation of these two sorts I have for many years (as an amateur grower) bestowed much care and attention, and with such success as always to take the first prize at our local exhibitions. Of course, I have grown many other sorts; but, on testing their qualities, I have at once removed them from my garden.

My mode of cultivation is to fix on a piece of ground entirely free from shade. About the beginning of July I commence preparing it by thoroughly manuring it, and if the soil be light I add some marl, as most Strawberries are fond of a stiff loamy soil, for the latter tends to throw them into bearing, instead of leaf. When the ground is dug and the plants ready, I tread well where they are to be planted. I choose runners with short roots, indeed those that have scarcely tasted the soil are to be preferred, as they more readily fix themselves in the ground. Though care should be taken to plant them a little below the surface, pressing the soil firmly to the roots, yet the heart must not be covered with earth, and if the weather be not rainy they will require water. The second, third, or fourth runners, or even runners from either of them, will bear equal to the first runner.

The great object is early planting, so as to get your plants well and deeply rooted before frost sets in, otherwise the frost, by raising the soil, will loosen the plants; then comes a thaw, the soil sinks and leaves the plants worse than fresh transplanted, nay almost out of the ground. Again, by early planting you obtain the finest and largest fruit the first year, the greatest crop the second; then directly root up your plants, and on no account keep them for a third year, indeed, for quality alone, annual plantings are best.

It rarely happens in a prolific sort by this early mode of cultivation that two plants out of 100 miss fruiting, but should they fail doing so the first year, the finer will their fruit be the next, though some persons entertain an idea that they are barren, and throw them away as worthless. In order to strengthen your young plants they should be deprived of all their autumnal runners as they make their appearance, for they necessarily weaken the parent.

Strawberry beds should always be kept entirely free

---

* These are the two principal forms of fructification. The sporangium is globose, and contains transparent sacs filled with sporidia, the pycnidium oblong, and stuffed with naked spores. The sporangia sometimes contain naked spores, larger than those in the pycnidia.

* The mode of action of lightning upon trees has lately been considered at length by Dr. Cohn in the Jubilee Memoir of the Breslau Society. He has observed that the electric fluid first takes the course of the alburnum, as the best conductor, splitting off the bark by the sudden expansion of the fluid; a part enters at the same time the older portions of the wood, which are comparatively bad conductors, taking the course of the medullary rays, or the points of contact of the annual rings, or both, and thus, according to circumstances, splitting the tree in various directions, and occasionally threading it to the extremity of the roots. See Denkschrift zur Feier ihres funf zig jährigen Bestehens, herausgegeben von der Schlesischen Gesellschaft, &c. Breslau, 1853.

* We beg leave to state that we have availed ourselves in this part of our subject of the valuable matter contained in that memoir.

from weeds, and the plants as distinct as when first planted out. April is the best time for removing the old leaves and refuse, for if cleaned earlier a severe frost, which sometimes occurs in March, cuts off the tender shooting leaves, which otherwise would be sheltered and protected from it. In the autumn, when you have taken sufficient runners for your new plantations, clear the old roots of all that remain. When the beds are cleaned in the spring some rotten manure should be put over the surface, and great advantage will arise from it, as the rains will wash the goodness of the manure to the fibrous roots, or you may give some weak liquid manure. Guano will be found to be perhaps the best; but this must be used sparingly, as few may be found to apply it with a sufficiently light hand.

Strawberry beds must never be dug or forked amongst, for by doing so you destroy a number of fibrous roots, which the plant requires in order to ripen fine fruit; and the soil is also so loosened by these operations that in the fruiting season the hot sun more easily penetrates to the roots, which require to be kept cool, to the great injury of the fruit. When the latter commences setting, and until the first berries begin to change colour slightly, you may apply to the roots any quantity of water, perhaps the more the better; but when that change takes place the beds cannot be kept too dry, or the flavour of your fruit will be impaired. One great object in giving plenty of water is that in dry weather land will crack, and such roots of the plants as cross the opening are broken, or so much strained and injured as to be of little or no service afterwards. Now, the watering will prevent this dividing of the ground. When the berry is about half-grown commence putting some loose straw between the plants in the row and then spread some clean Wheat straw between the rows about an inch thick, or you may take the cleanest of stable litter well shaken for both purposes; this prevents your fruit from being damaged by the grit and soil which would be washed up with heavy rains, keeps the ground cool, and tends to give that air of cleanliness, neatness, and order, without which a good article loses half its value. If the strawing be delayed till the berry is getting ripe, you may chance to bruise the fruit, and a ripe Strawberry bruised or handled never recovers its beauty; it is perhaps the most perishable and tender of all ripe fruits.

The method practised by many persons of putting the mowings of their Grass plots round their plants should be avoided as decidedly bad, for it is better to have the fruit damaged by grit than spoiled by mould. Even the name of the plant suggests the use of straw. The proper distance for planting the larger and better sorts is 2 feet each way.

Frogs and toads should be encouraged, they seek the beds for shade and subsist upon snails, black bats, and other insects that so frequently disfigure and destroy the finest of the fruit. If a Strawberry grower will observe a frog or toad gape, he will be convinced by the formation of its mouth that it was not made by nature to injure or feed on fruit; indeed more harmless and useful creatures do not exist in a garden.

I have now given all the information I possess relative to this subject, and I conclude with this advice to all growers of Strawberries. Get rid of old prejudices in planting and growing, and time, produce, and flavour will show the decidedly superior advantages of the above method of cultivation, though I do not pledge myself that any one, even by following my plan, will produce a fruit that will equal my "Sir Harry," much more surpass it. *R. Underhill, Sir Harry's Road, Edgbaston, Birmingham.*

VILLAGE HORTICULTURAL SOCIETIES.

As it is well known that one of the most successful managers of these highly useful associations is the Rev. Prof. Henslow, of Hitcham, we think it worth printing his programme for Monday next, as a guide to those who have less experience in such matters, and for the sake of showing by what simple means a few hundred villagers may be pleased, instructed, and improved.

HITCHAM HORTICULTURAL SHOW.

Programme for Monday, September 18, *instead of September* 20.

8 to 10 A.M. Specimens received at the rectory. Short days necessitate getting forward with our work.
12 A.M. Marquee Museum ready for inspection.
1 P.M. Flowers, fruit, and roots ready for inspection.
N.B. *Lecturets* on objects in the Museum.*
3 „ Report of the judges. Prizes announced, but, to save time, not distributed till another day.
4 „ Stewards to receive check tickets, and return specimens to competitors.
5 „ Tea, orderly and sociably.
6 „ God save the Queen. Good night; and may God see fit to grant us further opportunity for meeting in like friendly intercourse.

* Chief novelties in the Marquee Museum.

ANIMAL KINGDOM.

Birds.—Nine species of British owl; carrion and hooded crows, hoopoe, Bohemian wax-wing, European goat-sucker, common cuckoo, scarlet ibis; case of albino British birds; case of hybrid canaries, goldfinches, and linnets; two nests of Ceylon weaver-bird, suspended from a Palm-leaf.
Reptiles.—Cast skins of snakes.
Fish.—Sea bull (Ostracion).
Mollusks.—Additions to those of Hitcham.
Insects.—Economy of wasps' nests in regard to those of the common wasp and anchor-faced wasp.

VEGETABLE KINGDOM.

Dicotyledons.—Appearance called "tree in tree" in a Poplar. A large legume. Curious spiny stipules.
Monocotyledons.—Sugar-cane.
Acotyledons.—A very hygrometric Club-moss (Lycopodium).

MINERAL KINGDOM.

Decomposing nodules to be preserved by those who find such. What are called "St. Paul's teeth," in Malta.

MISCELLANEOUS.

Beautiful Box-wood model of a frigate. Two finely carved figure heads for ships. Madagascar paddles. Illustrations of the mode of preparing inlaid Tunbridge ware for boxes. Implements, type, &c., used in a printing establishment. Antiquities, how to preserve such when accidentally found: viz. vases, celts, coins, querns, &c. Hints for Industrial Amusement, ex. gr. wooden objects prepared by a shepherd on Salisbury Plain; carved stick by a labourer at St. Albans; Hitcham shells in ornamental patterns; Plantain, Grass, and Rush fruits imitated in small land shells from the rectory lawn.

HINTS TO ALLOTTEES.

Advantages of securing seed for improvement of races.
N.B. Wheat-ears on J. Curnall's allotment, 1853.
Cause of Fingers and Toes in root crops.

Results of Mr. Freeman's experiments with six Potatoes weighing ¾ lb.

On No. 107 were raised	34½	lbs. by	James Bull (mainly assisted by his sister Susan)	
„	1	„	30 „	Jos. Knock (by water-run)
„	63	„	30 „	Jonathan Grimwood.
„	38	„	29 „	W. Reynolds.
„	78	„	29 „	Wm. Levett.

N.B. Mrs. Henslow, of Bildestone, will increase the three prizes offered to five, to meet the difficulty of dividing the rake and the hoe between those who are equal as second and third respectively.

Although the highest produce obtained by any one is 1 lb. less than last year, yet the lowest now, which is 11½ lbs., is more than double that of last year. The average obtained by 23 experimenters amounts to 21½ lbs., equal to what the third best obtained last year. The judges consider that great pains have been taken with the cultivation, and it appeared to them that No 63 would probably have beaten No. 1, if he had not used manure in too raw a state, which they consider the cause why they found so many diseased tubers in this allotment, whereas they met with scarcely any among the rest. No. 107 seems to have best pulverised the soil before planting, which probably accounts for the greater produce obtained, whilst some of those who did not obtain more than 18 lbs. seem to have neglected this important consideration. The cleanest tubers were from No. 44, where there seems to have been less manure applied than to most of the others; but the produce was not more than 18 lbs.

Miss Henslow, of Bildestone, will produce some seed of a prolific dwarf Pea called Mummy Pea, and offers a prize of 2*s.* 6*d.* for the largest produce obtained by any of the allottees classed by the judges for "superior cultivation" this year; and Mrs. Henslow, of Bildestone, offers 1*s.* 6*d.* for the second, and 1*s.* for the third in amount.

Mr. Clover gives first and second prizes of 2*s.* and 1*s.* respectively for Red Wheat.

PULTENÆA.

Most of the species of this genus are exceedingly handsome greenhouse shrubs, being of a very compact habit of growth, profuse bloomers, and the flowers, if guarded from damp and bright sunshine, remain long in perfection in a cool house. Beginners should be careful in procuring young plants from the nursery to select such as are dwarf and healthy, with short-jointed robust wood; for they will find, if they procure weakly or sickly plants, that they are difficult subjects. If the young plants are obtained at once they should be placed in an airy part of the greenhouse close to the glass, and be very carefully supplied with water, for it is too late in the season to do much in the way of encouraging growth; but if they are found to be much pot bound, a small shift may be given, which will induce the formation of active roots, and cause them to break strongly in spring. Shifting, however, should be deferred until spring, unless the plants are in actual want of more pot room; for, in the case of beginners, there is some risk in repotting such things as are at all delicate just before winter. The principal points to be attended to during the winter season are giving a proper supply of water at the root, and admitting air on every favourable opportunity, avoiding exposing the plants to cold wind, and keeping them near the glass. Towards the middle of March encourage growth by keeping the plants rather close, but the night temperature should not exceed 40° or 45°, and air should be admitted by day whenever the state of the weather will admit, and the plants must be kept near the glass. Before inducing growth any straggling shoot should be cut back, and the branches neatly tied out, keeping them well down towards the pot, and rather thin, so as to admit light and air, and induce them to break closely and strongly. The state of the roots should also be seen to, giving more pot-room to such as require it; but it will be safer to defer shifting until growth has fairly commenced, unless in the case of such as are found to be much pot-bound. The atmosphere should be kept moist, giving the plants a gentle syringing on the afternoons of fine days, and shutting up early, so as to avoid having to use fire-heat, which is apt to render the atmosphere too dry for these plants.

As soon as the buds are started into growth will be the proper time for repotting, and this should be attended to before the plants suffer through the want of pot room. See to having the ball and soil in a proper state as to moisture at the time of repotting, and make the new soil rather firm about the ball. Very little water will be required for some time after potting, if the atmosphere is kept rather close and thoroughly moist, and no more should be given than may be wanted; for overwatering directly after potting is very apt to saturate the fresh soil, which, in the case of delicate rooted plants, is most injurious. Whenever the weather becomes sufficiently mild to allow of managing the plants in a cold frame without exposing them to a lower temperature, this will be the best situation for them, as the atmosphere, &c., will be more under control. The treatment here during the summer will consist in giving free admission to air on all fine days, a proper supply of water to the soil, and a slight shade from the direct rays of the mid-day sun. Any shoots that incline to out-grow the others, or to become straggling, should be pinched back, in order to maintain a close bushy habit; and when the nights become warm the lights may be thrown off the last thing in the evening, so as to expose the plants to the dew, which will greatly assist in keeping the wood strong; but the glass should be kept on while the air inclines to coldness, or during the prevalence of drying winds, and the plants should be moistened overhead in the afternoon, and shut down close for the evening. Vigorous growing specimens will probably require a second shift early in summer, and this should be attended to whenever it is necessary, and every means used to maintain vigorous growth. Use the shading very sparingly towards autumn, and discontinue the use of the syringe whenever the weather becomes damp and cloudy, and expose the plants freely to air, in order to ripen the wood before winter. A light airy situation near the glass in the greenhouse should be afforded them in winter, and they should be removed to this place whenever damp cloudy weather sets in. By subjecting the plants to similar treatment a second season, and with good management, they should be nice sized specimens for flowering, but those intended to flower should not be kept growing too late in autumn, as in this case they would probably not bloom so freely. Flowering specimens should be allowed to remain in some cool airy part of the greenhouse until the blossoms open, and should be shaded from sunshine to preserve the beauty of the flowers, which soon fade under bright sunshine. After blooming, cut the shoots back sufficiently to insure a close growth; give a moderate shift, and keep rather moist and close, but not warm, until they get into free growth, and otherwise attend to them as already recommended, but large plants may be gradually inured to exposure to the open air, and removed to a sheltered situation out of doors, where they will be screened from the mid-day sun. If placed in the open air, however, they must be carefully protected from heavy falls of rain, for they are very impatient of too much moisture at the root.

Cuttings of the half-ripe wood root freely enough; but beginners will find it to their advantage to leave their propagation to those who have proper convenience, and give their attention to this part of plant culture. For soil, use the very best peat that can be procured, selecting prime fibry pieces, which should be broken up rather small, and well intermixed with a liberal allowance of sharp silver sand and a sprinkling of lumpy bits of charcoal or clean small potsherds, to ensure the free percolation of water through the mass. *Alpha.*

SOME PRINCIPLES OF VEGETABLE PHYSIOLOGY,

BEARING ON THE CULTURE OF PLANTS.

By Professor W. H. DE VRIESE, of the University of Leyden.

(*Translated from the Dutch.—Continued from p.* 565.)

We are already upon the way to understand some of the phenomena, which, without the preceding remarks, we should be unable to comprehend. The proper temperature which all plants and all animals possess, is one of the thousand proofs of the wisdom with which everything in nature is established by the Creator. It also renders the plants in a certain degree independent of the vicissitudes of the circumstances in which they are found. There is life and movement, there is change of substances in the root, there is an increasing of the cells therein, and consequently growth; there is a movement and raising up of liquids from cell to cell, and thus higher and higher, though it is not brought about by causes visible to the eye, but by that power of absorption in the cells themselves, that we called "endosmosis." By this it is to be explained that the roots are active in the midst of winter, when there seems to be no trace of life in those parts of the plant which are above the soil. Therefore, the wood, which is felled in winter, is moist in the inner part; and the rising fluid ascends in trunks of trees and often causes large trees, the expansion of which is prevented by the cold, to split from top to bottom, and the juice that is taken up streams out through crevices on the surface. Thus the generally known phenomenon called "weeping, or bleeding," takes place in the Vine because the superfluity of fluids which the tissue could not contain, and which are forced up from the root, streams out from the trunk.

But as the internal temperature of the plant must have its own part in bringing that power of absorbing into action through the membranes of the cells, and in transmitting the fluid from cell to cell, so the exterior forces of nature have also their work to perform, though in a less degree. It is by the increasing heat—nay, it is even by the cold also of the atmosphere, that great influence is exerted; and the most immediate influence is the evaporation on the surface of the plants. It consists in the evaporation of water which is present in the plant in exuberant quantity, and is chiefly taken from the soil by the root.

Evaporation takes place outside the plants also during the cold season. A mass of ice diminishes always in circumference because its surface changes continually into vapour. If we expose to the air two vessels with equal quantities of water, but bring fire under one of them, the water will evaporate much sooner in the latter, but at last it will disappear entirely from both. The application of this principle to plants gives us the result that in winter also their surface may and must lose water, but that the loss of water must be greater in summer when the temperature of the atmosphere is higher.

We have the best proofs that dry cold produces and promotes the exhalation on the surface of plants; in other words, the "evaporation," as we shall henceforth

use that term. The cold north winds are injurious to plants in general. Whenever we say that trees are "scorched" by the wind, this means nothing else than that the air streaming by the leaves without ceasing causes evaporation in a much stronger degree than the moisture which must arise from the root is produced. The equilibrium between the evaporation and the supply of moisture is broken off, the tissue becomes exhausted, the membranes of the cells lose the power of further absorption and fall together, the leaf becoming dry and brown, falls off. Though the phenomena are not in all respects the same, the effect of cold on young field plants is not different. North and east winds bring cold currents of air, west and south winds damper currents. Therefore the former are injurious, particularly in the spring, and we are accustomed to protect our trees and plantations from their influence as much as possible. This injurious effect on fine fruit trees is particularly known by the nurserymen. They fear nothing more than the cold of the night, which is the more injurious when the days are hot, as occurs frequently in the spring, and when the position of the plants against walls or hedges causes the hot sunbeams to concentrate on the trees in a greater degree. A difference of temperature of 50° Fahr. between day and night is not rare in such circumstances. When the flower-buds cover the branches in thousands, and the hot sunbeams during day make the juices ascend in the heated plants, then the buds open, and the beautiful but extremely tender flowers expand with an astonishing rapidity. But when the cold of night succeeds the heat of that beautiful day of spring, it causes the fluids to evaporate out of the tender flower leaves, which crumple together; but the ascension of fluids through the branches for filling and re-strengthening the exhausted organs is not produced by it in an equal degree. The flowers and all they contain become unfit for the formation of the fruit; they fall before the time; the object of their existence is lost. Can there be a more reasonable explanation for the frequent failure of the harvest of our fruit trees, than in the premature opening of their flowers? Are not the means which art, based on experience, uses for protecting the trees against the cold of night, indicated by science itself? That influence of evaporation can be ascertained much better by other phenomena, and especially by a higher degree of temperature; so great is the influence, that we see in it the key to the explanation of many phenomena of vegetable life.

When leaves are put under an inverted glass, a moisture is seen on the inner surface. This is water, which is discharged from the leaves. What takes place in that glass happens also in the atmosphere in the natural state. Expose a plant to a great heat without bringing water within its reach, and very soon you will see it decay. But apply water to it before it is quite exhausted, and it will return to its former fulness. Put cut branches into a red, yellow, or violet liquid, and you will find that the inner tissue takes that colour, and consequently that the fluid has mounted into the plant. A French mechanic, Boucherie, some years ago, invented a means of preserving timber from decay. His object was to saturate with a substance which served to prevent all growth in the newly cut wood in which sap still existed. He cut the trunks from trees in their foliage, and placed them with the surface of the section in a mixture of acidum pyrolignosum with oxidium of iron. The black fluid was to be attracted upwards by continual evaporation, which would soon fill the younger branches, and take the place of the fluids which exuded through the leaves; thus the evaporation on the surface has exactly the action of a pump. In proportion as moisture is evaporated, water must be supplied, for the tissue cannot be empty.

(To be continued.)

Home Correspondence.

Limestone Walls.—As the economy of heat is of importance to gardeners and farmers, it may not be uninstructive to renew the subject of damp from limestone walls. "Somerset" will, doubtless, have a drier wall by a brick lining, but he must prove that it is "by intercepting damp" from the limestone; the question is, has it innate moisture? I thought so once, and lifted 5 or 6 limestone flags in an old entrance which were positively wet during warm, damp weather, but I found them so thoroughly dry on every side but that exposed to the atmosphere, that I replaced them; perhaps we may come nearer the cause of the damp appearance of limestone walls by considering the heat-conducting property of the stone as compared with brick. We know that clay houses covered with thatch are the warmest known; stone and slate the coldest. I think that following this idea may lead us to the proof that there is no innate damp in limestone. I cannot admit "T. P. S.'s" solution of the difficulty either; I have in this house a staircase descending to an outer door along a kitchen wall *flued*; this wall is painted 6 feet high in oil, above the plaister is merely coloured: in damp weather the smooth oil surface is pearled over with moisture, whilst the rest of the wall gives no sign of it. The enquiry seems to me full of interest and utility, and I wish some person, at once practical and learned, would set us all right. *D. V.*

Mr. Webb's Herbarium.—It may interest our botanical readers to know that the herbarium of the late P. B. Webb, Esq., whose sudden decease we reported last week, has been left by will to the Grand Duke of Tuscany; it will therefore be shortly conveyed to Florence, and be deposited in the museum there, where it will remain under the conservatorship of M. Parlatore, the Italian botanist. This herbarium had few or no rivals in the continent of Europe, except the Musea of the Jardin des Plantes, Berlin, Vienna, and St. Petersburgh, and was kept in admirable order; it contained the whole of Labillardiere's collection amongst others of great value. Mr. Webb seems to have succumbed to a complication of maladies; for two months he had suffered under a very severe attack of gout, which was succeeded by gastro-enteritis, symptoms resembling cholera and typhoid fever, which carried him off. The English service was read over his remains at his residence in the Champs Elysées, in the presence of a large concourse of scientific men, by whom his loss is most sincerely mourned. His remains were transported to England for interment in the family vault at Milford House. *J. D. H.*

Chinese Timber.—Can any one oblige the undersigned by saying what the tree is whose fragrant timber is constantly used by the Chinese as we use deal. It is some coniferous tree, no doubt, but quære what? Not a Pine, I suspect. Does your veteran friend, Mr. John Reeves, know? *Jael.*

Rain Gauges.—I have attentively considered Mr. Slatter's communication at p. 565, on the subject of my rain gauges in Pembroke Dockyard, but I do not think he has shown any error in the observations. I will not dispute the theory from which he infers that some additional amount of rain would have been received by the 5-inch gauge had it been placed at the same level as the 8-inch gauge, instead of 37 feet 6 inches above it, although I am inclined to doubt whether sufficient data exist for determining invariably what the exact increase per foot should be. But I very much doubt whether a 5-inch gauge at the same level, and by the side of the 8-inch gauge, would actually have received as much as the latter, for this simple reason that when it was so placed it did not do so. The two gauges were side by side for two years, during which time the excess in the 8-inch gauge was 4.957 inches, being an annual excess of 2.478 inches, which is only 0.188 inch more than the difference between them when the 5-inch gauge was on the tower. Besides, if an addition is to be made to the amount really received by the 5-inch gauge while it occupied the higher position, the same in proportion must be added to the receipts of the 8-inch gauge when it was there; and there will then be an excess on the side of the larger gauge more than sufficient to neutralise the correction added to the smaller one, and enough to make the total excess on the 4½ years considerably on the side of the 8-inch gauge, under the three different relative positions in which the gauges were placed. It would, perhaps, strengthen the argument if I were to give up that series of observations to which alone Mr. Slatter refers, because the remaining three years' results give an excess over the smaller gauge, which would be still more increased by applying the proposed correction to the 8-inch gauge at the high level. But I am not disposed to do so, because I think all careful *bonâ fide* observations (which these were) are, as far as they go, useful, and are much more valuable when given as actually taken than if corrected by any assumed rule, to suit a theory, however correct that theory may be. But are we in a position to assert that that theory is absolutely and invariably true in all cases? Mr. Miller's extensive and careful experiments in the mountains of the lake district prove beyond question that the amount of rain increases the higher the gauges are placed, until about 2000 feet are reached, above which height it again decreases; and this, I think, was not expected, until found to be so by actual observation. There may be an anomaly in the results I have recorded, but certainly it is not because they were observed in a dock-yard. The one in question occupies 73 acres; the high sheds over the building ships are ranged along the north side of it; the tower stands at the opposite side of the yard, near the western angle, entirely isolated and removed from any other building. A more exposed situation for a gauge cannot well be found. The lower gauge was also quite open to all the wet quarters, and on the north and east sides the buildings were sufficiently far off to be incapable of affecting it. I think, therefore, that I may still maintain that during four and a half years the larger gauge received a greater amount of rain on the average, invariably, than the smaller, which is all I ever attempted to show. I am not concerned to argue whether a 10-inch gauge is or is not large enough for all practical purposes; I dare say it is so, but the question in hand is whether a 12, 18, 24, or other larger size will not record a larger amount of rain in proportion than a 10-inch or smaller size. *T. S. P.*

Roses by the Million.—It may not be much known with what facility cuttings of the Hybrid Perpetual and Hybrid China Roses strike, and what nice plants they make. The cuttings may be taken at any time when ripe, and planted in a border with a north aspect, or, if shaded, in any other; of Géant des Batailles hardly one will miss, and Louis Bonaparte, Madame Laffay, Magna Rosea, H.C., strike nearly as well; the H.P. may, when rooted, be potted, introduced into heat in the winter or early spring, and soon will produce their flowers. *N., Newport, Isle of Wight.*

Hardiness of Conifers.—Your leading article of Saturday last, on the hardihood of newly introduced trees and shrubs (in regard to which you appear not to have received returns from this county) induces me to presume you will find the following report acceptable from this place:—Pinus insignis, planted in 1850, turned brown in the winter and spring 1853-54, but it is now (September) perfectly recovered and growing well; it is about 9 feet high; P. excelsa, planted in 1837 and 1850, is quite uninjured, growth rapid; P. Gerardiana, planted in 1851, is uninjured, growth very slow; P. Lambertiana, planted in 1849 and 1851, is uninjured, growth rapid; P. Fremontiana, planted in 1852, was killed in 1853; P. Llaveana, planted in 1851, is uninjured, growth slow; P. Benthamiana, do. do. do.; P. Sabiniana, planted in 1852, is uninjured, growth rapid; P. radiata and Montezumæ, do. do. do.; other varieties, as apulcensis, Ayacahuite, Hartwegi, leiophylla, filifolia, longifolia, oocarpa, orizabæ, religiosa, Teocote, died a season or two after being planted out. Abies Douglasi, planted in 1837, and now from 15 to 20 feet high, is much injured; A. Menziesi, planted in 1839 and 1851, the former plant is much hurt by insects, but neither is injured by the season; growth rapid. A. cephalonica, planted in 1840, is uninjured, growth slow; A. Smithiana and morinda, planted in 1841, are uninjured, growth slow; A. Brunoniana, planted in 1852, was protected in winter but injured in spring, growth rapid; Picea Nordmanniana, planted in 1852, is perfectly uninjured; P. Pinsapo, planted in 1849 and 1852, do.; P. nobilis, planted in 1850 and and 1852, do.; P. Webbiana, planted in 1851, has had its side shoots killed, leading shoots uninjured; P. Pindrow, planted in 1849, side shoots uninjured, leading shoots killed (in a very exposed east aspect); P. amabilis, planted in 1849, is uninjured, growth slow; P. grandis, do., uninjured; African Cedar, planted in 1849, is uninjured, growth rapid; Deodars, planted from 1838 to 1852, are uninjured; Araucarias, planted from 1839 to 1850, uninjured; A. brevifolia, planted in 1850, do.; Cryptomerias, planted from 1848 to 1851, in very exposed situations, much injured, in others perfectly uninjured; C. viridis, planted in 1852, is perfectly uninjured and growing rapidly, although in an exposed situation (east); Taxodium sinense pendulum, planted in 1850, is uninjured; T. distichum sempervirens, planted in 1849, died in 1850; T. sempervirens (Sequoia gigantea), planted in 1849 and 1850, uninjured; Cupressus Goveniana, planted in 1850, died in 1853; C. torulosa, planted in 1849 and 1850, uninjured; C. Uhdeana, planted in 1850, do., growth rapid; C. Lambertiana, planted in 1850, do., growth very rapid; C. thurifera, planted in 1850, died in 1853; C. elegans, planted in 1851, do.; C. Corneyana, planted in 1851, is uninjured; C. Knightiana, planted in 1851, died in 1853; C. funebris, planted in 1851, side shoots injured in 1852-53, but uninjured in 1853-54; C. majestica, planted in 1851, lost the leading shoots in 1853-54, otherwise uninjured; Juniperus recurva, planted in 1849, uninjured; J. hibernica and chinensis, do. do.; J. excelsa, planted in 1852, injured (this was not a healthy plant); J. Bedfordiana, do., dead in 1853; Thuja Warreana, planted in 1849, uninjured; T. aurea, planted in 1850, do; Biotia orientalis stricta, planted in 1851, do.; B. glauca, planted in 1852, do.; Larix pendula, planted in 1849, do.; Cephalotaxus Fortuni, planted in 1851, do.; Libocedrus chilensis, planted in 1852, do.; L. viridis, planted in 1852, do.; Fitz-Roya patagonica, planted in 1852, do.; Saxe-Gothæa conspicua, planted in 1852, slightly injured in 1853-54, but now quite recovered. *A. Townley Parker, F.H.S., Cuerdon Hall, Preston, Lancashire.*——I have just read your leading article, in last week's Paper, relative to the hardiness of the Pine tribe, and as my experience differs from that of your other correspondents in a few instances, I will mention them. In the first place, among the true Pines, which you say are too tender to be worth planting, halepensis has with me been totally uninjured; while among those whose hardiness you say seems to be established, Ayacahuite has been so much injured as to necessitate its removal. Among Spruces, again, Morinda has all the young wood killed, including the leading shoot some 18 inches long; and among Silvers, the Webbiana and Pichta, which you pronounce hardy, are killed to a stump, and must be removed, though the former is undoubtedly breaking again. Among Cypresses, those you mention have all stood perfectly well (including macrocarpa), except two plants of torulosa, out of a good many, one of the latter being a fine plant 12 or 15 feet in height, but is so completely spoilt that I have cut it down. Lastly, as regarding Junipers, whilst tetragona was completely killed, Bedfordiana, standing within a few yards of it, was uninjured. None of my Araucarias have suffered, but the Deodar suffered a little by the spring frosts. P.S. I have made a mistake in including Cupressus thurifera in my notices—I do not possess the plant. *W. F. G. Farmer, Nonsuch Park, near Cheam, Surrey, Sept.* 11.——I perceive my name mentioned, as having returned Cupressus macrocarpa among my plants that were killed by the intense frost of January last. It had all the appearance of being so, and I was about to remove it altogether, when my gardener and I perceived some signs of vitality about it, particularly in the leading shoot. Encouraged by this appearance, we permitted it to remain, and we now have the satisfaction of seeing a vigorous branching head, but its lower laterals were completely destroyed. My Deodars have not yet recovered, and I am very doubtful whether some of them ever will. Libocedrus chilensis, although apparently unhurt by the winter, has withered away since, and I am very doubtful of its flourishing in this climate. *Oswald Mosley, Rolleston Hall.*——With reference to Pinus insignis, I beg to state that various specimens of it are planted on my property in different situations, sheltered and exposed, but not one of them (to my knowledge) was injured during last

winter and spring. The climate here (Clevedon, Somersetshire) is mild, but the sea-breezes are very keen and fresh. An Abies morinda also lost its young shoots. P. insignis grows here far more rapidly than any evergreen tree with which I am acquainted. I have two or three specimens planted amongst Scotch and Pinasters on a hill-side, facing south, but rocky, and exposed to the westerly gales. They are outstripping all the trees around them, and are rendered conspicuous by their rich green foliage and shapely growth. The Cedrus Deodara, at least whilst young, does not seem to like an exposed situation. Some specimens I have are stunted and distressed. The excelsa seems nearly as hardy as the insignis, but not quite so fast in growth; its shape, however, seems better adapted for resisting the wind. I should think that the insignis, if not carefully planted, would be liable to be blown over. *E.* ——Here (High Elms) P. halepensis has been perfectly hardy, but I have not been able to raise P. macrocarpa and P. Cembroides, several having failed, but not from frost. P. insignis flourishes—one died, I know not from what cause, when it was apparently in a most vigorous state. One Taxodium sempervirens died, cut off by the frost, others close by were uninjured. I have lost this summer many Apple trees and Laburnums, apparently in full vigour; I cannot understand the cause. *L.* ——In my opinion your correspondents have all omitted one great essential, while writing of the hardiness of Conifers, viz.—the distance of the plants from water. Here in West Suffolk, on high ground, I had a plant of A. Khutrow a good deal injured, close to a pond, although a much larger plant, and much more exposed, but near no water, is perfectly unharmed. Also near water Picea Pindrow turned rather yellow, and made very little growth; and Cupressus torulosa lost its leader. Pinus excelsa, not mentioned in your summary, stood near water quite untouched. Is there much risk in moving a very growing plant of this latter, about 8 feet high, of course taking up as good a ball as we can manage? I propose operating within the next fortnight. *G. J. B., Sept.* 12. [We should not fear to move it.]

The Sunflower.—Among my papers I find the enclosed—it was drawn out from information I had received of the value of the Sunflower, and sent some time since to New South Wales, where I thought it might eventually prove useful when labour became cheap, which at present does not seem very probable. It has struck me that it might be well suited for introduction into the Madeira Islands, where they require some new export, since their staple product, the wine, is failing from the effect of Vine disease. It may also serve, if my information on the subject is correct, as a material for paper-making. There is time this season to try the experiment on a small scale, from any small number of seeds and stems which you may be able to collect; and if it turns out that only one-half can be done of that which is stated, it will be useful, and worth the trial. "The Sunflower (Helianthus annuus) is propagated by seed, which sown in the spring produces seed again in the autumn. It grows rapidly and exhausts the soil like Tobacco or any other drawing crop, and is particularly suited for woodland or rich alluvial land newly broken up, which generally renders the growth of Wheat, &c., too luxuriant for the production of seed. The plant grows large, and 2½ lbs. of seed are required for an acre of land, which it is stated will produce 1½ ton of seed, 2 tons of stems and branches, which when stripped will yield 1½ ton of silky fibre, and ½ ton of coarse fibre, and 2 tons of leaves. The ton and a half of seed husked will produce 840 lbs., or 93 gallons of oil fit for table use or for lamps, as well as for machinery and manufacturing purposes. The oil is so pure and free from aqueous particles that it is particularly suited for watchmakers and all the finer parts of machinery. The seeds are also valuable as an article of food, making, when ground into flour, excellent bread, pastry, and biscuits. The fine fibre of the stems is suited for making all descriptions of paper, and the coarse for the manufacture of ropes, mats, cordage and canvas. The leaves are superior green food for cattle, and the cake remaining, after the oil is pressed from the seeds and husks, is valuable for fattening them." Any part of the plant not required for any of the above purposes, yields by burning excellent potash for manufactures or for manure." *B.*

Material for Paper.—Amongst the various plants that have been proposed as substitutes for rags in the manufacture of paper, I have seen very few that could be easily produced without somewhat encroaching on land that could be more profitably employed. There are numbers of plants that will grow by our roadsides and river banks—plants that cannot be uprooted without great difficulty—that I think might be used with great advantage for paper making. Amongst these I may mention more particularly the Butterbur (Petasites vulgaris), Coltsfoot (Tussilago farfara), Burdock (Arctium Lappa), &c. The first two, more particularly, are everywhere very abundant. To these I think might be added Hemp Agrimony (Eupatorium cannabinum), the different species of Epilobium, &c. I see Mr. Bentall is interested in this question; would he be willing to make an experiment of some of these plants? The Coltsfoot and Butterbur are now in perfection by all streams, and could be collected at a trifling expense, even by children. *T. W. Gessing*, 44, *High Street, Worcester.*

An Article for Cottagers — Culture of Cabbages.—Trench the ground lengthways in the direction in which the drills are to run, at least one spit deep, with a paring off the surface, which turn over into the bottom of the open trench. The dung should be buried regularly in the bottom of every second trench, the middle of which is to be marked at each end with bits of sticks to mark out the centre of the dung over which the line is to be stretched when the plants are to be set. This kind of digging is by the Scottish cottagers called hough trenching; this mode of culture should be always adopted when littery dung or night-soil is used. The plants may be set as the digging proceeds, or if not the surface should be left rough-ridged until planting time. when Cabbages are to be cut for the kitchen or the market they should not be left too long uncut; cut them with a little slope, and no more than is necessary for cooking, leaving all the under leaves entire for some time. Thus 20 or even 30 crops of excellent Cabbages may be obtained from the ground in one season, viz., from the end of May to the end of February, cutting the heads regularly as they advance to maturity, and as above hinted. Like Brussels Sprouts, each successive cutting will be found of better relish than the preceding one. The Early Vanack is a good kind for this mode of culture, as it is not so ready to burst or crack as the other early sorts, a point of much importance to the cottager, especially during the present state of the Potato crop. *Robert M'Nab, Morningside, near Edinburgh.*

Syringing.—In perusing your leading article at p. 547, I noticed a passage, which is, in my opinion, calculated to somewhat mislead. After describing the condition of continental gardens, you say, "There is not an apprentice with us who would not stare at being ordered to syringe his plants in the morning, or mid-day, at least there ought not to be." Now, what are we to learn from this? I believe, in fact I am positive, that it is the practice of many of the best cultivators of fruits and plants (of course I allude to those grown under glass) at the present time, to thoroughly moisten their plants overhead, as well as the entire internal surface of the structure in which they are grown, in the morning, more especially if there is a prospect of the occurrence of a bright, sunny day. Those who are in the habit of forcing French Beans during winter and spring, know that without an abundant supply of water overhead in the morning and during the day, it would be almost an impossibility to keep down those pests, red spider and thrips. Now, if we admit the correctness of the remarks referred to, then I say that numbers of gardeners at the present time are wrong in their practice. I certainly think that the subject will admit of an explanation, which will be of service, more especially to young gardeners; and I also think that the practice of experienced men is, or ought to be, more relied upon than mere theory. *G. N., Ealing.* [Be practice what it may, it is certain that plants should not be syringed in the morning as a rule. Of course when weather is overcast, or in the early year, when the sun has no power, morning syringing does no harm: but at such times it is not wanted, if the business of the gardener is properly performed. When plants are well wetted, in well-managed houses in the evening, there will have been no loss of moisture during the night, unless by the action of brick flues and a high temperature. But both the latter are wrong. Flues, when moisture is wanted, should be furnished with evaporating pans, and night temperature should be carefully kept down at the time when plants want atmospheric moisture. If a house is too dry in the day, it should be moistened by flooding the floors, or watering the walls, and not by syringing the plants in bright sunshine. With regard to winter and spring forcing, as the sun has no power at that time, it is of no consequence when the syringing is done; but with good management it is not wanted even then, except at night.]

Mosquito Smoke.—In answer to your correspondent, who asks for information as to the plant mentioned by Mr. Fortune as burned by the Chinese to drive away mosquitoes, I may state that I have somewhere read or heard of the plant in question being a species of Artemisia. I wish that I could remember my authority, which I at the time considered to be good; I have already delayed in the hopes of more precise information turning up, and send this in the hope that the suggestion may prove useful. *J. D. Hooker, Kew.*

New Plants.

85. Escallonia densa. *Pl. and Linden.*

"A bushy shrub and small tree, growing in the highest parts of the province of Merida. It is a pretty species, with small, shining, very dense leaves, and having numerous pinkish white flowers. With a little shelter it would probably stand our ordinary winters, for it has often been met with covered with snow, and on the banks of streams which are frequently frozen." Stands in Mr. Linden's catalogue at 15 fr.

We are unacquainted with this plant.

86. Lobelia Ghiesbreghti. *Linden.*

"This elegant little species is a native of Mexico, and was introduced by M. Ghiesbreght. It flowers very abundantly; its pretty red blossoms expand in succession during the whole summer, and continue as late as October." Priced in Mr. Linden's catalogue at 10 fr.

Only known to us from the above announcement.

Garden Memoranda.

Holland House, Kensington.—The flower garden here, which consists of beds edged with Box on gravel, is now as gay as bright-coloured flowers can possibly make it. The beds are for the most part filled with Verbenas, which make a brilliant display and last long in perfection, and their varieties being now so numerous, they comprise nearly every colour which is required for out-door decoration. Among good deep purple sorts, which are still comparatively scarce, the best appears to be Purple King, whose uniform growth and profusion of flowers render it difficult to be superseded for bedding purposes. Some of the best delicate pink kinds with a crimson eye were Jane, Lady Holland, and Etiole de Venus. Louis Philippe is a dark velvety crimson, compact in habit, and good, and Macrantha is a very desirable rosy pink variety. Lady of the Lake and St. Margaret's are well-known kinds, and even where Verbenas are extensively grown, as they are here, the old Tweediana cannot well be dispensed with. White Perfection is employed for white beds, as is also white Campanula, which, if deprived of its decaying blossoms and seeds after the first flowering, will bloom profusely a second time. Œnothera macrocarpa has been brilliant as a yellow bed, but its beauty is now over. Among masses of Calceolarias, one made up of a band of bright yellow on the outside, with an inner band of deep brown and the centre filled with stronger growing pale yellows, had a good effect. Of Heliotropes, Corymbosum, owing to its compact growth, deep rich colour, and the freeness with which it flowers, is the greatest favourite. Scarlet Pelargoniums are cultivated here in great quantities both for beds, borders, and vases. For the last, which are made of Maltese stone, and set at regular distances apart on all the terrace walls, Tom Thumbs are exclusively employed, and when uniformly grown and well flowered, as those here are, they produce, as may be imagined, an effect truly striking. When their blossoming is over, their tops are pruned in, and their roots cut back, so as to allow them to go into small pots, in which they are wintered in a greenhouse in which the fire heat employed is just sufficient to keep out frost, and no more. In beds, Flower of the Day and Robinson's Defiance Verbena were mixed together, and edged with the pretty little Lobelia racemosa; and in a border in front of the Orangery were the following Geraniums, planted in rows, viz.:—Cerise Unique and Compactum in the middle, with Frogmore Scarlet next the house, and two rows of Tom Thumb and one of Mangle's Variegated, and Flower of the Day in front. On the lawn was a good bed of the dwarf deep purple Dahlia Zelinda, edged with a band of white Alyssum. The low terrace walls which divide the parterres from the lawn are covered with crimson China Roses, which are now beautifully in bloom, a condition in which they are more or less all the summer and autumn, even up till frost comes. For ornamental facings for dwarf walls what can therefore be more suitable than this, or even the common China Rose?

The magnificent Orange trees, of which there is an admirable collection here, are now all in the open air; their fresh green colour and luxuriant growth, show them to be in the best of health, and, owing to the bright weather we have lately been experiencing, their young wood has got nicely ripened. The largest of them measures about 10 feet in diameter of head, which is beautifully symmetrical in shape. Several others are, however, nearly as large. None of them have been retubbed for some time. The arches and walls of the Orangery are finely clad with Cobæa scandens, which flowers and fruits abundantly, and permitted as it is in places to festoon from the roof, it has a charming effect. The square pillars which support the roof are covered quite 10 feet in height with Fuchsia corallina, which is at present one mass of blossoms, and extremely ornamental, the long slender branches hanging tier above tier in graceful succession from top to bottom.

Fruit has been a good crop here this year. The orchard has only been planted five years, and it is well sheltered from the north and east. Marie Louise and Crassane Pears are bearing famously as standards; and of Plums, such as Denyer's Victoria, and other good kinds, there have been abundance, small trees yielding more than a bushel each. Gooseberries are also said to have been a heavy crop, and quite free from the blight which has been so common elsewhere this year. Plums are, however, a little affected with it. Wall fruit has also been good. Both Apricots and Peaches on young trees have been plentiful. The latter are on a concreted border, and have proved most satisfactory.

FLORICULTURE.

Wintering Carnations.—It is a fact which I think cannot be disputed that many layers are annually lost by over kindness; being made more susceptible of cold than they otherwise would be by the nursing and coddling they get in frames; and where the plan can be followed, of wintering them under a glass roof with open sides, I would most certainly recommend it. But for those who either cannot or will not be at the expense of such an erection, the old system of protection must suffice. They must, therefore, choose a north aspect for their frames, and put a thick layer of coal-ashes on the bottom, on which rows of bricks must be laid, sufficiently far apart, that the pots may stand just touching each other: the frame should be tilted at bottom, to admit a free current of air, which it is desirable to obtain as long as possible. Brick pits or frames, which are decidedly preferable, should have square apertures, both before and behind, with a sliding panel or door, in order that in rainy weather, when the lights are down, a circulation could not be obtained; and on this I would lay great stress, for being kept too close engenders

mildew, and too often ruins a whole stock. While in their winter quarters, attention must be paid to taking off the lights on every opportunity, and drawing them over again on the appearance of rain. In fact, it must be borne in mind that abundance of air, without unnecessary exposure to cutting winds, is essentially requisite for the health of the layers. During the time they are in the frames, the soil or compost in which they are to be flowered should be well looked after. The heaps should be often turned, and especially in frosty weather, when a vigilant look-out must be kept for wire-worm. The compost I would recommend is two barrowfuls of rotten turf, well broken with the spade; two barrowfuls of very rotten horse-manure, from a Melon or Cucumber-bed; one barrowful of rotten leaves, *i.e.* leaf mould; and one barrowful of road sand. All this should be well mixed and repeatedly turned, so that the incorporation may be complete. The turf ought, every bit of it, to go through the hand, and the lumps be pulled to pieces, to detect the hidden foe; and though only one wireworm may be found, still you may consider yourself amply repaid for your trouble. The soil having been well turned, about a fortnight before the time of planting the layers out, which is generally about the latter end of March, sometimes sooner or later, according to the season, I put plenty of drainage in the pots, and fill them to the rim with the compost, which will then subside before I plant; and, in order that the soil may be perfectly clear, or to make assurance doubly sure, I insert pieces of Carrot and slices of Potatoes, to entrap any grubs or insects which may have before escaped; a more certain way than this, however, has lately been adopted by a friend of mine; he puts about 2 pecks of soil at a time into his side-oven, and, after subjecting it to a heat destructive to vitality, whether in the shape of worms or eggs, he removes it, and subjects another parcel to the same process, till he has sufficient for his use: and in parts of the country where ovens are common, and where, of course, there is a constant and abundant heat, a great deal can be effectually cleaned with no other expense than the trouble. All this may to some growers appear needless, and a trouble which the difference will not repay; but it is punctuality and care in small matters which very often enable the grower of 50 pairs to beat the careless cultivator of 500, and at the same time prevent the loss and mortification of seeing layer after layer of some favourite sort go off in rapid succession. If this then can be prevented, I think it will be acknowledged that no trouble is too great that will accomplish it. I now come to the planting of the layers out in the pots. They should be set a pair in each, and the pots ought not to be less than half pecks. A hornbeam, or other hedge, having a south or south-east exposure, will be found most suitable for them. A wall ought to be as much as possible avoided; such a situation will be found extremely prejudicial, being so liable to draughts and eddies. After having been planted a short time, the sticks may be inserted in the pots, for if delayed, it is very probable the roots may be injured. As the layers grow, or spindle, as it is usually termed, they must be carefully tied up to the sticks; with soft worsted, or fastened with Rowland's metallic wire. After they have grown about a foot high, a top-dressing of very rotten cow manure will be found beneficial; and as the weather gets warmer, they must be carefully watered, the soil in the pot never being allowed to get thoroughly dry. As the buds appear, and you have decided which to remove, they may be reduced in number, and the laterals, or side buds, also taken away, in order that all the energies of the plants may be directed towards to those that remain, which will increase their size, if intended for exhibition. The number of these should be regulated according to the strength of the plants; some think that three flowers are enough for each layer to bring to perfection, but five, I think, is generally about the mark. I understand that some cultivators reduce to one, when intended for exhibition. The buds and plants will now be subject to the attacks of various pests. The cuckoo spit is one of them, and is easily seen and removed. The green-fly is more common and troublesome, but may easily be got rid of by using a small bag of India-rubber, filled with Scotch snuff, with which the buds must be dusted very early in the morning, or immediately after rain; the insects will then generally be found clustered together, and a puff or two of snuff destroys them effectually.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The bright dry weather which has prevailed of late has been very favourable for the increase of red spider, and any specimens which are at all inclined to be weakly or sickly should be carefully examined, and if they are found to be at all infested with this pest, immediate steps must be taken to clean them; for if the foliage is allowed to become disfigured now it will be unsightly for months to come. Give air freely, in order to get the young wood well matured, which is the only way of avoiding the attacks of mildew, insects, and all the many ills to which plants with badly ripened wood are subject in winter. Trim and thin the twiners on the roof, so as to admit light freely, particularly over winter flowering plants that have not ripened their growth, such as the Luculias, &c., for such things will now require all the light that can be afforded them; but if they have hitherto been kept closely shaded from bright sunshine, the shading should be gradually discontinued. Preparations should be made for housing or protecting tender plants from heavy rains without loss of time, for it is not safe to calculate upon the continuance of the present delightful weather much longer, and persons who may be under the necessity of resorting to temporary protections, such as skeleton pits, &c., should lose no time in getting these ready, so as to be prepared for the worst. While fine weather continues, however, everything will be better left out of doors, exposed to the free action of the air and the night dews; only be prepared to place them under some protection immediately heavy rains or frosty nights occur. Cold Pits.—The temperature, &c., of these must be regulated in accordance with the wants of the inmates.

FORCING DEPARTMENT.

Pinery.—The whole stock of plants should be carefully attended to with water, giving them a liberal supply, excepting of course those maturing their growth; for, with the bright weather which we are experiencing, there will be considerable risk of a portion of the stock fruiting prematurely, unless they are well supplied with water at the root. Also keep the atmosphere moist by gentle syringings, and frequently sprinkling the paths, &c.; but plants showing fruit should not be syringed overhead until after flowering. Dispense with the use of shading as far as can be done without risk, and expose the plants to all the light possible, to induce fine strong robust foliage, and a stocky habit of growth; for plants of this character are always found to produce the finest fruit. Young plants growing in open beds will enjoy an occasional watering with chilled manure water; and those swelling fruit will also be benefited by a liberal supply of the same. Keep Black Jamaicas and Montserrats intended to show fruit towards the end of next month dry at the root, and expose them to sunshine, to thoroughly check and mature their growth; and if this is properly effected, there will be no danger of their showing fruit at the proper time. Vineries.—If bright weather continues it will be advisable to shade Grapes that are thoroughly ripe and wanted to hang for some time, to prevent their losing their plumpness, which some sorts soon do when kept too warm. Give abundance of air at all times, but where the Grapes are ripe avoid allowing drying currents to blow through the house. Stop laterals in the late house, keeping the foliage regularly exposed to light, so as to have it as healthy and vigorous as possible. Late fruit beginning to colour should be encouraged with plenty of warmth and air; for fruit ripened during this fine weather will be very superior in quality, and will also be more likely to hang than if it has to be ripened by artificial means later in the season, when there will be comparatively little sunshine. Keep thrips in check by repeated fumigations, and use every means to prevent red spider injuring the foliage. Peaches.—As the trees will now be freely exposed to the air day and night, very little attention will be required here for the present. The foliage should, however, be guarded from red spider by occasional washings with the engine, in order to preserve it in health until it has performed its functions, and decays naturally. If any trees have to be removed from the open wall to here this may be done immediately the present crop of fruit is gathered, as the removal, if very carefully effected, will not prevent the wood ripening, and there will be plenty of time for the trees to make fresh roots and get sufficiently established to be able to carry an average crop of fruit next season, if not forced too early. Melons.—The late crops of these, unless wanted for some special purpose, should be pushed on as rapidly as possible, for besides being very uncertain late in autumn, fruit ripened after cloudy damp weather sets in is never good for much. Maintain a brisk steady bottom-heat. Keep the Vines clear of laterals, and look sharply after red spider. Give air freely during the day, but shut up early in the afternoon with a rather high moist temperature, giving a little air late in the evening, if necessary, to prevent damp.

FLOWER GARDEN AND SHRUBBERIES.

It is not improbable that the delightful weather of the last few weeks, and the pressure of other work, &c., may have induced some persons to delay the work of propagation; winter is, however, fast creeping upon us, and every possible dispatch should be used with this work, where it is at all in arrears; for cuttings put in after this time will be difficult to winter, unless very carefully managed, and every possible dispatch used to get them rooted and hardened off without loss of time. Get those that are rooted placed in their winter pots, and treat them carefully till well established, and such as are moderately established in the pots in which they are to be wintered should be freely exposed to the night dews, and stopped, &c., to induce them to form sturdy short-jointed growth. It will be advisable, however, to shade them from bright sunshine for a few hours in the middle of the day, while bright dry weather continues. If any of the beds appear to be suffering for the want of water, lose no time in giving them a good soaking. As stated in a previous Calendar, the present month is a very favourable season for the removal of large shrubs or trees, and preparations should be made for commencing such work immediately the weather may become damp or showery; and where a large amount of this kind of work has to be effected this season, we would not hesitate to commence it at once, for it will be more expeditiously and safely done now than after the plants will have no chance of making fresh roots before winter.

FLORISTS' FLOWERS.

Collect Carnation and Picotee seed as the pods turn brown, leaving a small portion of the stem attached. We usually tie a dozen together, placing the pods in a thin gauze bag, and hanging them up by the stems in a dry airy room; here they keep well till the period arrives for sowing, when they may be rubbed out. Attend to Hollyhock cuttings; do not water too much, as they are apt to rot. Early layered Carnations will be ready to pot off. We like to do it in good time, that the roots may establish themselves; much of the well doing of the layers during winter depends on this. Prick out seedling Auriculas in store pans, about an inch apart. This will be sufficient room to allow them during winter.

HARDY FRUIT AND KITCHEN GARDEN.

If any of the Peach trees are infested with spider they should be well washed with the engine directly the fruit is gathered, but in order to avoid saturating the borders, which would be injurious to the ripening of the wood, endeavour to make a little water serve by using a fine jet and applying it carefully to the affected parts of the tree. Trees that are at all inclined to over luxuriance should be gone over, stopping all strong growing shoots, which will cause the buds left to become plump, and there will be no danger of their starting into growth after this season. Exhausted crops, as Peas, &c., should be cleared away as quickly as possible, getting the ground manured, dug, or trenched, and planted with Cabbage from the July sown beds. But sufficient spare ground must be reserved for early Peas and other spring crops, and such as may require trenching should be selected for this purpose, as there will probably be leisure in course of the autumn and winter for getting such work done. Tie up Endive to blanch, and plant out, in a sheltered warm situation, the late crop; also attend to blanching Lettuce, and plant out the August sown on a warm dry border. A quantity of Kidney Beans should be sown in pots, to be removed in-doors when the weather becomes unfavourable, when, if a proper place can be spared for them, they will bear abundantly, and come in very useful. Attend to Tomatoes, keeping the shoots closely stopped, and exposing the fruit fully to the sun's influence.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,

For the week ending Sept. 14, 1854, as observed at the Horticultural Gardens.

Satur. 23	65.8	46.2	56.0	14	1.21	1	6	5	1	6	5	4	1

The highest temperature during the above period occurred on the 17th, 1843—therm. 81 deg.; and the lowest on the 17th, 1840—therm. 29 deg.

Notices to Correspondents.

Books: *T B B O.* We have requested the publisher to send you a prospectus by post.—*A S.* We do not know.—*A B.* Brown's "Forester."

Church Heating: *A Churchwarden.* Although our opinion of the principle remains unaltered, yet heating by warm water is so much cheaper than it was, and is so much better understood than the other, that we advise it in prefeyence. We should use 4-inch pipes. Apply for tenders to the advertisers in our columns.

Crickets: *Reader.* Treacle spread about half an inch thick in the bottoms of saucers is said to make a good trap for them. They stick fast in the treacle, and are thus easily secured and destroyed.‡

Names of Plants: We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Lightcliffe.* Ophioglossum vulgatum.—*A A.* We have repeatedly said that we cannot undertake to name plants not in flower. I seems to be some Solanum, and 2 some Plumbago. If on another occasion you receive no answer, you will know the reason why.

Potatoes: *H M.* Your variety (alluded to last week, at p. 584) which you have found to be fully a fortnight earlier than the Ash-leaved Kidney, is the Fortyfold, a well-known kind, and a good cropper.‡

Potato Seed: *Sub.* Sow it in April or early in March, on a slight hotbed in rows 4 inches apart, adding a little soil between them as the plants advance. Give air freely on fine days, and water gently. As soon as all danger of frost is over, plant them out in rows, placing the plants pretty thickly in the rows. Nothing more is needed, but to attend to them in the usual way.‡

Preserving Fruit: *Sub.* The recipe you seek for is, we presume, Mr. Lovejoy's, which is as follows: "Pick the fruit from the stalks; put them into the bottles. Put one drachm of alum into four gallons of boiling water; let it stand till it is cold; then fill the bottles; bung them tight; then put them into a copper of cold water, and heat it to 176 degrees. Then tie them over with bladder and seal them." ‡

UPPER PERUVIAN GUANO ON SALE.—
Apply to W. & J. RAVENSCROFT & Co., Liverpool.

Extract from a Report of Dr. Ure, F.R.S., &c.

"Your Upper Peruvian Guano is worthy of all commendation."

Extract from the Report of George Layton, Esq.

"RAVENSCROFT'S Upper Peruvian Guano will last longer, and eventually do more good than Gibbs', or any other I have ever tried. It possesses the very finest qualities of both Guano and Bone Dust."

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PEAT CHARCOAL.—The undersigned have a cargo of this valuable Deodoriser and fixer of Ammoniacal matter, on Sale. Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Crate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

BALANCE OF FACTS IN FAVOUR OF
RICHMOND AND CHANDLER, who have, in competition with the best selected CHAFF CUTTERS of the most celebrated makers in the trade, carried off the highest prizes against all comers.

COPY OF TESTIMONIAL.
"Early Court, Reading.

"GENTLEMEN,—I beg to hand you a cheque for your Corn Crusher; I must add, at the same time, that nothing can exceed the goodness of the Machine. I have found in it all I can wish, and, moreover, a very superior finished Machine, and a pattern for other makers. (Signed) "GEO. SHACKELL."

"Messrs. RICHMOND & Co."

Address.—RICHMOND & CHANDLER, Manchester; and South John Street, Liverpool.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

THE CONICAL HOT-WATER BOILERS, as invented by John Rogers, Esq., are only to be obtained of JOHN SHEWEN, IRONMONGER, Sevenoaks, Kent.
Contracts given for Heating.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

TO FLORISTS AND OTHERS.
J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

SMITHFIELD CLUB, 1854.
CHRISTMAS FAT CATTLE SHOW.—The Annual Show of Fat Cattle, Sheep, and Pigs, will take place on the 5th, 6th, 7th, and 8th of December, 1854, at the Carriage Bazaar, King Street, Portman Square, London.
All Certificates must be returned to the Honorary Secretary on or before Saturday, the 4th NOVEMBER, 1854.
Prize Sheets, and the necessary Printed Forms of Certificates, are now ready, and can be obtained on application to
B. T. BRANDRETH GIBBS, Hon. Sec.
Corner of Half-Moon Street, Piccadilly, London.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Students are admitted after the summer and winter vacations, also in April and October. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 16, 1854.

MEETINGS FOR THE ENSUING WEEK
THURSDAY, Sept. 21—Agricultural Imp. Society of Ireland.

FROM time immemorial farmers have been familiar with the advantages of carefully attending to the ripening and harvesting of that portion of the crop destined for the seed of next year. The middle of a ridge, for instance, may make very good seed, while both ends the reverse, or *vice versâ;* and to reap and carry hurriedly the whole into one stack, mixing the good and bad together, is obviously contrary to sound practice.

They have also been familiar with the facts that a large portion of what is sown never vegetates, however carefully covered, especially in seasons like that of 1853 in reference to the quality of the seed; that much of what does so, often fails to arrive at maturity; and that adversities of this kind are more severely experienced in bad climates than in good. Hence the common practice of testing by sowing a given number of seeds in flower-pots or boxes within doors, or under a sod at the sunny side of the corn-stack, in order to ascertain the proportion which may fail. Whatever per-centage does not germinate, a similar proportion of seed requires to be added to the ordinary quantity sown—a proportion greater in bad climates than in good.

The imperfect organisation of the seed may be the cause of its unproductiveness, or it may be injured in the harvesting, stack-yard, or threshing by various other causes. Examples of the latter kind are generally known from observation, and are therefore shunned as much as possible; but those of the former are less perceptible, and though often anticipated or guessed, as it were, from outward appearances, and the kind of weather about flowering and ripening, yet the most satisfactory method of examining quality is by experiment as above; and even with this precaution the greatest circumspection is necessary, for seeds of a very weakly constitution sometimes germinate more favourably than sounder ones, and yet the young plants hardly appear above ground when they instantly die. In this respect the vegetable kingdom is similarly circumstanced with the animal, the first period of life being liable to many constitutional casualties.

Even after an experiment has been made, and the number of barren and productive seeds fairly ascertained, under given circumstances, such circumstances, in nine cases out of ten, are very different from what seasons subsequently exemplify, so that the wise maxim of "making provision for the worst" has to be adopted. Take the present season as an illustration—where the seed was, in many cases, but of a second-rate quality. No one will say that the same quantity of seed ought to be sown next year, under the glorious harvest we have experienced, as was sown last year.

High farming and thin seeding go together, producing results incredible almost to all save those who have reaped them; but the practice requires if possible better seed, in order to avoid blanks, than is needed under thick sowing, and therefore more attention at this season to its selection and harvesting. If the best samples are secured in harvest, and stacked and threshed with equal care, a very small quantity will suffice in seed time, if the soil is properly cultivated and prepared for receiving it.

WE have received calculations from Cirencester of the expenses of reaping by machinery, which are certainly not very encouraging to the purchasers and employers of reaping machines.

The week before last, at the Royal Agricultural College, M'CORMICK'S reaper was used for the cutting of a field of 17 A. 1 R. 11 P., and the following calculation has been handed to us of the actual expense incurred in the operation. It is based upon the following data:—

One horse per diem	... ...	3*s.* 6*d.*
One man do.	... ...	3*s.* 8*d.*
One boy do.	... ...	1*s.* 0*d.*

We should usually credit a horse 2*s.* 6*d.* for a day's work, but as the work with the reaper is rather too severe for the same horses to go on with it for the whole day, the farmer is charged with 3*s.* 6*d.* a day for a single horse, to cover the expense of an occasional change; for while two horses cannot well do the whole work of drawing a reaper for ten hours, it is not exactly work sufficient to employ four, as those which have drawn the reaper in the morning can be employed in the afternoon in some lighter work; with this explanation we give the calculations of the expense of cutting, binding, and stooking the field of Wheat on the Royal Agricultural College Farm, of 17 A. 1 R. 11 P.:—

August 19	...	2 horses, 7 hours	...	£0 4 11
—	...	15 men, 6 hours	...	1 13 0
22	...	2 horses, 5 hours	...	0 3 6
—	...	14 men, 5 hours	...	1 5 8
23	...	2 horses, 7 hours	...	0 4 11
—	...	12 men, 7 hours	...	1 15 11½
—	...	2 boys, 7 hours	...	0 1 4
—	...	1 man, 5 hours	...	0 1 10
—	...	1 boy, 5 hours	...	0 0 6
24	...	2 horses, 3 hours	...	0 2 1½
—	...	14 men, 3 hours	...	0 15 5½
—	...	4 boys, 3 hours	...	0 1 2½
				£6 11 4½
Use of machine (costing 20*l.*) for 20 hours, at 5 per cent. per annum			... ...	0 0 1½
				£6 11 6

The cost per acre on this calculation amounts to 7*s.* 7*d.* and a fraction. The time of the horses is calculated from their leaving their stable to their entering it again; and the time reckoned for the men was the time they were actually in the field; while the 20 hours' work of the machine was the time during which it was occupied in cutting.

It is to be remarked on this, that 22 hours were occupied in the reaping of 17 acres of land. We do not understand what the 15, 14, 12, and 14 men employed on the successive days were about all this time. Is it meant that 14 men are wanted to tie and stook after a machine which does not cut one acre per hour? The cost calculated may be, as the *Journal* from which this statement has been sent us puts it, *below* the truth, when we come to consider how much more of the Wheat cut by machine is not tied at all, but raked together and threshed out as tail and refuse corn; but it is much *above* what under ordinary management the expense would amount to, if the tying and stooking were performed at the rate at which it generally stands.

There never was a more magnificent harvest season than the present, hitherto, and one great difficulty which reaping machines experience—viz., the clogging of the driving wheels owing to the dampness of the surface soil, notwithstanding the fitness of the straw for the sickle, has been hardly felt this year. We shall be surprised if we do not hear some more favourable reports of their operation than either that of Mr. HALL, or this from Cirencester.

THE fact that grazing stock after this season feed more industriously than previously, is not undeserving of notice. A dairyman's herd of some 12 or 14 cows and a bull, are just now grazing in an enclosure in front of our window, where they have been so for the season. In the early part of it they were to be seen more frequently lying, or when feeding less actively engaged, or not browsing in such haste. At present they are obviously in better condition than at the former period, and yet apparently more hungry, and even starved, as it were, and therefore eating more greedily. The bite is rather shorter than it was, but closer and thicker, and therefore insufficient to account for differences. In an adjoining close, occupied by a butcher who has some five or six fat bullocks, and about 30 southdown sheep in it, we find a similar state of things, and might quote hundreds of acres within sight corroborative of the same. In each case the ox or sheep not only feeds more actively now than formerly in June, but longer. How are such circumstances to be accounted for?

The causes are many, and, although less or more influenced by the peculiar circumstances of each case, are yet of a general character. For example, there is a difference in the quality of the Grass, irrespective of the quantity, and a difference in the condition of the alimentary system consequent on the change of season, and probably also an instinctive disposition on the part of nature to make provision for coming wants, or lay up a store of fat for winter use. The first of these causes is no doubt the most efficient and important.

From time immemorial farmers have been familiar with the fact that Grass is more nourishing in the early part of the season than at a more advanced period, and consequently less of it is required to produce a given effect or uphold the animal system at a given weight. At the first period the growth of the Grass may be slower, from the absence of moisture and presence of greater drought, than at the latter, and yet support a larger stock. In the one case, bullocks and sheep will lay on fat rapidly, without the addition of artificial food, if they are only sheltered from the mid-day sun, while in the other such cannot be accomplished without a little cake or corn, even with a fuller and fresher bite.

They are also familiar with the fact that Grass grown after July and August, as the aftermath, goes into little bulk when made into hay, and that this does not wholly arise from the absence of stem in the latter case and abundance of leaves, but from the leaves themselves containing more water. And besides deficiency of weight, the quality is also inferior, proving that there is a difference between the other constituent elements at the two periods, besides a difference in the quantity of water, which may have a greater effect upon the physical wants of cattle than is indicated by the mere weight of solid and liquid matter consumed; for if a decrease takes place of any individual element absolutely necessary for the building and keeping in repair the body, to the extent say of 50 per cent., then twice the quantity of Grass will require to be consumed before a sufficiency of this element can be obtained, and, consequently, the excess will have to go to the ordinary waste or offal not worked up in the animal system at all, but rejected in the fæces; and in proportion to the per centage wanting, will the waste be, or the bullock ceases to fatten at the same rate, and the cow to give an equal quantity of rich milk.

The nature of the season, the fertility of the soil, and climate of the district, must for similar reasons exercise a peculiar influence upon the quality of Grass at both of those periods. Instances may occur, that Grass grown in June may not be more nourishing than the produce of September. A warm September, for instance, with a sufficiency of moisture, and an ample supply of manure, may produce richer Grass than a cold, wet June. It is a well-known fact, that Grass grown in some of our southern provinces will fatten a bullock as fast, and even faster, in September, than what is grown on an equally fertile soil in the north in June—a result illustrative of the influence of the weather and climate upon the quality of Grass.

LOIS WEEDON SYSTEM.

IT may be somewhat presumptuous in one who, in whatever degree he may be an inquirer, does not pretend to science, to dispute on any point with Professor Anderson; yet I trust I may be permitted, with due diffidence, to consider the views he has taken of the Lois Weedon system, as to its supposed exhausting effects; vide *Agricultural Gazette*, p. 490. His words are—

"I do not conceive that the method he (Mr. Smith) advocates is likely to come into general use, nor do I think it possible that it can be carried out without, in the long run, impoverishing the land. Conceal it as we may, frequent tillage is only a means of bringing the valuable constituents of the soil rapidly into an available condition; and sooner or later the supply contained in it must be diminished or exhausted. Mr. Smith seems to think that something is absorbed from the air—probably ammonia and nitric acid; but even this would not suffice to counterbalance the loss continually going on. The whole quantity of nitrogen deposited annually by the rain on an acre, in these forms, amounts, as has been stated in a former part of this paper, to 20 lbs.; but a crop of Wheat removes from 50 lbs. to 60 lbs. of that element. The whole matter comes to this:—There are two methods of increasing the produce of land—tillage and manuring; and that system cannot be a good one which relies upon the one to the exclusion of the other."

The first part of this sentence of Professor Anderson would lead us to infer that he supposes, in some not distant period, by Mr. Smith's tillage, an exhaustion of the inorganic constituents of the soil, for it is they that are brought by it rapidly into an available condition; but this can scarcely be his meaning, for in a previous observation of his, in the same article, he states as "the unequivocal fact that all fertile soils contain their valuable mineral constituents in quantity sufficient to supply an almost endless succession of crops." Liebig reckons the supply by thousands. Indeed Mr. Anderson glides immediately from the sweeping declaration of the valuable constituents of the soil becoming diminished or exhausted by this frequent tillage, and resolves his argument into the mere want of sufficient nitrogen.

Admitting the statement of the Professor with respect to the amount of nitrogen deposited by rain as correct, though much under the estimate of Liebig, Mr. Smith, and I believe all others, still we are to recollect that it falls upon the surface of every acre of the globe, while, possibly, not one acre in a thousand bears a crop of Wheat, nor even, let Mr. Smith's plan meet with what success it may, can we expect to double the number of acres under that crop. Now, over much of this surface, the nitrogen which is brought down by rain falls only to evaporate and pass again into the air, while in the fields so tilled as Mr. Smith's, nearly the whole that falls is imbibed and retained. Carried by the currents of the air, the ammonia not absorbed is brought over those lands which have drunk in already that which was previously superincumbent, and which is prepared to receive it. But I am not disposed to admit that any measurement of ammonia in rain water can convey to us even an approximation to the true quantity which a soil receives from the air; new stirred earth must, even in the absence of moisture, lay hold of any ammonia floating on the surface, it must also imbibe that which falls on it in dews. But is it not possible—can it be otherwise—that in the various combinations in the soil in which oxygen enters, and to many of which the presence of water is necessary, the nitrogen of the air and hydrogen of the water may be liberated, and, in their nascent state, unite and form ammonia, in which state nitrogen is believed to be taken up by plants. If this surmise is well founded, the frequent tillage of Mr. Smith will, in facilitating the combinations of oxygen with the mineral constituents of the soil, set free much nitrogen and hydrogen; and so, instead of exhausting the soil of ammonia, increase the amount of it, while the minute division of its clayey particles will increase its retentive powers.

It is shown that Mr. Smith has had, in his field, ten successive crops of Wheat; according to Professor Anderson's estimate they have used up from 300 lbs. to 400 lbs. of nitrogen beyond what the soil has received from the air. Mr. Smith says, "When I first double dug my field, I found the staple but 5 inches deep, the subsoil of four-fifths of the land being yellow clay, the rest a mixture of sand, gravel, and clay." And it does not appear, and we have no reason to suppose that its organic condition was other than the ordinary one of land under tillage, in which the supply of manure or nitrogen had been merely sufficient to give remunerative crops for a very limited period. But Mr. Smith has had ten crops of Wheat, fully up to the average of his neighbourhood; and as they indicate no diminished fertility in the soil, his field must be supposed still to contain sufficient nitrogen for a great number of crops. Can we credit such an accumulation of nitrogen? Can we imagine that the organic matters in his field, under such favourable conditions for their decomposition, are yet to be broken up? Can we believe "Mr. Smith is now spending the dormant capital of his land?" But should it be so? Would not a very small outlay in nitrate of soda restore to his Wheat field its used-up nitrogen?

Professor Anderson says, he does not conceive that Mr. Smith's method can come into general use; to me it appears to offer such inducements to the farmer that nothing but that inertness which seems to be equally a property of mind as of matter, and which ever stands in the way of change and improvement, will delay its progress. I do not mean to say that the details which Mr. Smith thinks indispensable must be preserved, but they may and I think will be modified, while the principle of perpetual fallow shall be maintained. But surely, in what are commonly called Wheat soils, and in soils which may be rendered so, the profitable culture that gives ten crops of Wheat in succession, even were no more to be obtained, will induce trials which must inevitably lead to its general adoption; and the more so when to this is added the profits arising from the more than ordinary green crops produced by the annual application to them of the whole of the manure raised on the farm, and on which hereafter as many more valuable crops of Wheat may be grown, while the worn out, if worn out it may be, Wheat ground will then produce its future magnificent green crops. *J. M. Goodiff, Granard.*

P.S. Mr. Anderson is not quite correct in inferring that Mr. Smith's system excludes manuring. What is manure? Is it not that which supplies food to plants? What is the disintegration of the soil which permits such an action of the atmosphere as compels its mineral constituents to give themselves to the use of the vegetable world, which facilitates the passage of air to the roots of plants? Mr. Smith says in this he differs from Tull; "I do not refuse manure. The essence of the scheme I propose is, not that it dispenses with manure, but that with manure, where required, it enables the farmer to draw from half an acre of land a produce beyond his now average produce from a whole acre."

FISH MANURE.

FOR many years past M. Molon, a French gentleman, farming land in the department of Ille and Vilaine, has made use of fish for manure. For the purpose of diminishing the bulk of the manure, and of obtaining as concentrated a substance as possible, his plan is to dry the fish, and to reduce it to powder. The following method is that which several years' experience shows to be the best.

The fish is first disintegrated in a copper with double walls, by the action of steam of several atmospheres of pressure, introduced between the walls. After the water and oil contained in the fish have been allowed to run off, the residue is submitted to considerable pressure, and the cakes thus obtained are then rasped down. The broken fish is next spread in thin layers on canvas stretchers, which are placed in stoves constructed for the purpose, and are there exposed to currents of hot air. The process of drying is by this means quickly completed, and as the dried fish is taken from the stoves it is ground to powder in a mill. When pulverized the manure is ready for immediate use, but may be kept for any length of time. Analysis and experience both show that the powder possesses all the properties of a good manure. Large quantities have now for two years been used by other farmers, and the result has always been superior to that obtained from Peruvian guano. The oil derived from the fish is saleable, and the price obtained for it enables the manufacturer to deliver the manure to the farmer at a rate sufficiently low for agricultural purposes. *Comptes Rendus.*

APPLICATION OF THE REFUSE OF TOWNS: LIQUEFIED MANURE FARMS.

IN reference to the proceedings at the recent meeting of the Liverpool and Manchester Agricultural Society, and to one of the important topics of discussion there, we have been favoured with the following information, which, we believe, will prove acceptable to a large class of our readers:—During the last week, Mr. Chadwick, *en route* to the north, in company with Mr. Mechi, has visited some new works in progress for the application of the refuse of towns, and farms worked on the new system of liquefying the solid manures, and applying them in the liquid manure, of which some account may be of interest.

In 1840, when Mr. Chadwick first commenced his investigations of the means of improving the health of towns, having established the principle that the cheapest and best mode of removing the refuse of towns was by smooth channels instead of rough, and in suspension in water, the next difficulty was how to deal with the foul accumulations. Mr. Smith, of Deanston, proposed to apply the sewerage to agricultural production by the method of the water meadow, or submersion, which has been in use nearly half a century near Edinburgh, with extraordinary success in productiveness, four and five-fold crops being obtained by the tenants, and rentals of 20*l.* and 30*l.* per acre by the owners. But when Mr. Chadwick, as the Government commissioner, visited Edinburgh, the town council preferred sanitary objections against that method, and he reported generally in their favour. These objections have been confirmed on further investigations, as set forth in the blue books, as occasioning the ague and typhus in men, and the rot in sheep. In Lombardy, the formation of water meadows within six miles of towns is forbidden. On further investigation, Mr. Chadwick was led to propose, as a means of obviating entirely the sanitary objection to the formation of sewer lakes or marsh surfaces near towns, the systematic application of sewer and other manures by the means of a flexible hose and jet, worked by steam power, propelling it through underground pipes, or by gravitation. He induced the late Mr. James Thomson, of Clitheroe, to make an experimental trial of the distribution of sewerage from his works by this method. He afterwards promoted trial works of distribution by steam power from the Worsley canal, conducted with the aid of Mr. Philip Holland and Mr. Joseph Whitworth, of Manchester. He afterwards promoted similar trial works under the Metropolitan Sewers Commission, in London, of which an official account was given and circulated amongst agriculturists.

He obtained Mr. Huxtable as one of his first disciples. Mr. Smith, of Deanston, became a convert to the new practice, and recommended it to Mr. Harvey, of Glasgow. Mr. Kennedy, of Myer Mill, in Ayrshire, then adopted it, and was followed by Mr. Telfer, of Ayr. The Duke of Sutherland directed an examination of Mr. Kennedy's very complete works, and, upon the report, has had a new farm laid down on the same principle, at Trentham. Mr. Harold Littledale, of Liverpool, has laid down a large liquid-manure farm at Birkenhead. The results of all these and other works were published by the late Board of Health in "Minutes of Information," which have been adopted as text books for the agricultural school at Glasnevin, in Ireland, where a model farm is laid out on this principle; and have been translated for official circulation on the continent. Mr. Mechi followed next as a practical convert, and reports that the system has enabled him to turn his balance-sheet in the right direction triumphantly.

The new practice does not consist merely in the application of the natural liquid manures, such as urine, but in the liquefaction of all the solid manures. In the Minutes of Information it is shown that one load of stable manure put in water, and applied in solution or suspension, will either fertilise an area of five times the extent fertilised by the same quantity of solid manure form, or give a five-fold fertility to the same area. It was imagined by Liebig himself that liquid manure would be washed out by the first shower; but the experiments on the Worsley canal showed the line of the flaxen hose, through which the manure transuded, in excess during the second year. Mr. Kennedy, of Myer Mill, goes on pumping liquefied manure upon his fallows, during the winter, and it shows the quantity pumped in the fertility of the succeeding crop. Instead of single dressings, as under the old system, 10, 12, or more are given under the new system, and the pumping with graduated supplies of food is always going on. Mr. Mechi throws into his tank or cauldron, dead horses and dead cows, which are dissolved, bones and all, and reappear as flesh-producing corn. A similiar use is in preparation for the dead dogs and cats which now pollute the water and the air of towns.

The local boards of a number of towns under the Public Health Act are now struggling with the difficulty of obtaining land for applying, by the new method, the sewerage of their districts. When the commoners can be settled with, common and Lammas lands will be used; new works are however in progress in 12 towns. The first instance of their completion is at Rugby. The outfall of the town sewer was unavoidably carried into a stream before the mansion of G. R. Walker, Esq., and he was led to pay attention to the serious prospective nuisance and the means of getting rid of it, when he was advised that the most effectual and beneficial means of doing so was to apply it to his own land by the method of pipe distribution. After visiting the farms of Mr. Kennedy and Mr. Telfer at Ayr, and examining also that of Mr. Mechi, he made an offer, which was accepted by the town, for the whole of the sewerage for 20 years. When visited on Tuesday it was found that between 500 and 600 acres were under irrigation. Seven miles of pipe had then been laid down, and five hydrants were kept constantly at work for the distribution by steam-power. Mr. Walker assured Mr. Chadwick that the nuisance was entirely abolished, and that he was so perfectly satisfied that he was about to extend the area irrigated to about 700 acres, which would fully use the sewerage from 700 or 800 houses. The results in the improved quality and increased quantity of the Grass, and the line of irrigation, were perceptible at a distance, by the resort of the sheep thither to feed by preference.

The next works for irrigation with town-manures, inspected by Mr. Chadwick, accompanied by Mr. Mechi and Mr. W. Wilmot, were the new works just completed for Mr. Worsley, of Platt Hall, Rusholme, near Manchester. The local board of health of the suburban district of Chorlton had been compelled to carry their outfall sewer into the stream which passes through his park and before his mansion. He too was advised, and adopted the advice, to dissipate the nuisance by taking up the sewerage before it came into the stream, and distributing it by pipes and

jets upon his land. This land had been previously prepared by under drainage for its reception; and the Rush had been dislodged from its primitive seat as denoted by the name of the place. A small steam-engine of four-horse power was at work, forcing the sewerage through underground pipes, and its distribution was going on through a gutta percha flexible hose upon about 70 acres of meadow land. The drainage works for Rusholme were commented upon as imperfect, and as supplying an inferior quality of sewerage for comparison.

On Tuesday afternoon, Mr. Chadwick and Mr. Mechi attended a gathering of some of the principal landowners of Cheshire, at the farm of Mr. W. Wilmot, at Hulme Walfield, near Congleton. This farm had been laid down upon the new principle. When taken in hand by Mr. Wilmot, it was an old exhausted dairy farm. It consisted of 120 acres, of which 16 were laid down in corn. It only kept 23 beasts, and the corn land yielded 23 bushels. Mr. Wilmot drained it. With the stream of drainage water obtained, he works an hydraulic ram, forcing a portion of the water to a tank on the top of a cattle shed. With this water, and by means of hose and jet, the dung is constantly removed and cleared away into a contiguous manure tank, which receives also the urine. The whole is diluted, and distributed over the fields by wooden pipes (Mr. Chadwick and Mr. Mechi avowed their preference for iron, notwithstanding the lower first cost of the wood), at a pressure of 90 feet by a flexible gutta percha hose and jet.

Forty acres are now laid down in corn, and 10 acres in market garden for the supply of Congleton. The crops of corn, Mangold, Beans, and Celery, were splendid and unrivalled. Mr. Mechi acknowledged that some of the crops exceeded his own. The yield of corn had been increased in quantity from 22 bushels to 45, and the others in the like proportion as to quantity, and improved greatly in quality. In the place of 23 beasts, Mr. Wilmot is now enabled to keep 100. On the following day, the judges at the agricultural meeting at Congleton awarded to Mr. Wilmot a prize for these irrigations. The outlay for the drainage works was about 5*l.* per acre, and for the irrigation about 2*l.* per acre. The additional value of the land estimated for these improvements was more than 1*l.* per acre per annum.

Mr. J. May, of Macclesfield, stated that he had laid down a small farm on the new principle, and parties were considering of the application of the sewerage of the town.

The results spoken of by Mr. Alderman Neild, at the Lancashire agricultural meeting, as having been obtained on his farm from the use of liquefied manure, were obtained by manure distributed by the water-cart. In the Minutes of Information, it is stated that the comparative expense of the distribution of 15 loads of solid manure from about a mile of distance was, by cart, 1*l.* 7*s.*; of 15 loads by water-cart, including the expense of poaching the land, was 18*s.* 9*d.*; and of 15 loads of liquid manure, by short hose, from a stand pipe (as at Mr. Worsley's), was only 6*d.* This reduction of the expense by the new method of distribution facilitates repeated applications to be made of the manure, and also enables applications to be made of plain water. The expense of a watering equal to a thunder shower, where there is water, is little more than 6*d.* per acre. Mr. Mechi stated at the meeting that if he had more water he could use it, and he acknowledged that if, instead of 24 inches of rain, he had 44, as in Lancashire, it was so much additional power with drained land, for which he would be willing to pay an additional rent. In the evening, it was matter of observation at Mr. Wilmot's that his land was free from the mist which distinguished the surrounding land which was undrained. *Manchester Guardian.*

AGRICULTURAL EDUCATION IN FRANCE.

[Our able contemporary the *North British Agriculturist* has lately published some valuable papers on Agricultural Education in France from a correspondent in that country, the following being his report on the principal regional school, that of Grignon, about 20 miles from Paris.]

The period of education extends to three years. The students at entry are generally from 17 to 20 years old. The course commences in November and extends over the whole year, with two short vacations of two weeks each. Before entry they are examined upon arithmetic, the four first books of geometry, the general properties of bodies, the thermometer and barometer, geography. They require also to write an essay, to show their proficiency in grammar and orthography. During the year they are examined each fortnight by an assistant to the professor upon the subject of the previous lectures, who gives them a note at the end of each year, when they undergo a general examination by each professor for passing to the superior division. At the end of the third year they receive a certificate from the Minister of Agriculture, if the last examination has been sat sfactory. The examination is done principally by having subjects connected with agriculture given to them to write essays upon—such as irrigation, drainage, the construction of farm buildings, &c. Each year the students pay the sum of 30*l.* When the students can show that their parents are unable to support them at the school, they receive from the Minister of Agriculture one half, and also from the Departmental Council one half; this being granted only when the student passes a satisfactory examination at entry. Sometimes the sum is extended to 40*l.*

The "personnel" of the establishment is composed in the following manner:—one director, one sub-director, five professors, five repetiteurs, assistants to professors, one "econome," taking charge of the food, clothing, &c., of the establishment; one assistant for direction, secretary, treasurer, a clergyman, one master of practical farm operations, with two inspectors.

The first professor lectures upon rural economy and agricultural legislation; the second upon practical agriculture; the third upon "Zootechnie," or economy of cattle; the fourth on botany, chemistry, and geology, applicable to agriculture; the fifth, rural engineering, comprehending irrigation, draining, rural buildings, land surveying, &c. Each professor is assisted by a "repetiteur," who explains to the students the subject of lecture, when they feel any difficulty in following the lecturer. They also demonstrate, examine the students, and see that their note-books are well kept.

The professors are not required to live at Grignon, but all the "repetiteurs" and students require to board and lodge in the establishment. The repetiteurs and students take their meals together. The students sleep in large rooms, small divisions of 3 yards square being set apart for bed and other furniture. The divisions are of wood 3 yards high. The entrance is shut by drawing a curtain. There are attached a library, a museum of physics and chemistry, and all that relates to the "region;" accordingly, the geology, zoology, botany, and agricultural products are represented. Each professor has a collection for illustrating his lectures.

The students are expected to be up by half-past 4 o'clock in the morning, a bell being rung at that time. Breakfast at half-past 5, coffee, or milk and bread. Second breakfast at 11 o'clock; dinner at half-past 5, beef, vegetables, &c., with wine; one half pint is allowed, the same also at the second breakfast. Thus each student has one bottle of wine per day. They are expected to be in bed by 9 o'clock. The time which is allowed for amusement is one hour in the morning, one hour in the middle of the day, and one from 6 to 7 o'clock in the evening. The time for study is from 6 to 11 A.M., and from 7 to 9 P.M. The remainder of the time being for the inspection of the fields and also for attending to the cattle.

The lectures by the professors are generally delivered at half-past 6 and half-past 9 A.M. The time occupied in delivering usually one hour and a half. Each professor also makes a practical application in the field upon the subject of the lecture. The remainder of the students' time is taken up with writing out notes and studying in the library, examining cattle or field operations, or in working in the experimental field, in which several experiments are always in the course of being made. The number of students is on an average from 30 to 40 in each division, in all under 100. They are chiefly the sons of small proprietors or tenant farmers. The greatest number come from the neighbouring counties; some are, however, from the eastern and other parts of France. There are no out students. At Versailles all were out students, and consequently the number was greater. The average number at Versailles was 250, and among these were many upwards of 40 years of age—gentlemen, who, having acquired property, wished to acquaint themselves with the cultivation and general management of land.

The expense of Grignon School in 1850 was as follows, 96,000 fr. in whole, from which have to be deducted the fees of scholars amounting to 27,500 fr.; and, for the sale of farm produce sold off the experimental field 3500 fr.; granted by Parliament, 65,000 fr. annually, equal to 96,000 fr.

The students, of previous years at Grignon, have formed themselves into a society for correspondence for mutual improvement. A director and counsel of administration have been named. As many of these students have become farmers in Algeria, keeping up the connection with Grignon enables them to become acquainted with the progress of agricultural improvement in France. Such an association is otherwise well calculated to extend the knowledge of a better system of cultivation than is generally practised in France.

Farm of Grignon.—[We must here condense the report]. The extent of the estate is 1162 acres, the soil of which varies very considerably, partly resting upon a chalk or a calcareous rock, part on clay, and part being an alluvial soil. The appearance of the farm is a deep valley; the two sides being chalky, the declivities clay, and the bottom alluvial. The elevation at the farm buildings is between 200 and 300 feet above the sea. There are no fences in the cultivated land. The extent which is under regular rotation is only 677 acres, the remainder being under meadows, garden ground, and water (a small lake). The farm offices are in the middle of the farm.

Rotation.—The 677 acres are divided into nine breaks of 75 acres each. One break natural meadow, irrigated; two breaks in Lucerne and Sainfoin; the other six are in regular cultivation.

1. One break, green crop—Carrot, Beet, and Potatoes, all manured. 2. One break in Oats, Barley, and occasionally Wheat. 3. Trefoil Red Clover. 4. Wheat, autumn sown. 5. Colza Rape, land manured; sown in September, cut by the end of June or middle of July. 6. Wheat, autumn sown. The rotation is not very strictly adhered to, varying according to circumstances.

Of the green crops, Carrots vary most in weight; of Beet the weights per acre vary from 13 to 16 tons; of Potatoes, previous to the blight, the average produce was 8 tons per acre. The early variety now grown does not average more than 5¾ tons. Part of all green crops is sold at Versailles, and part consumed by stock. Oats average 30 bushels per acre; Barley averages 41½ bushels per acre; Wheat averages 31 bushels per acre; Colza Rape is grown for the seed. The straw is used for litter, and the cake given to the horses, cows, and sheep. Average crop of seed is 26.7 bushels per acre. As much as 10*l.* per acre is obtained for the oil.

Cows.—The number kept is about 80, and eight bulls. They are housed all the year and stall-fed, with the exception of being turned out each day to pasture, principally for exercise; when the cows are not in milk they are worked upon the farm. They are fed during summer on green food, chiefly Lucerne and Sainfoin; the quantity of Sainfoin they were consuming during the month of June was about 80 lbs. daily. During winter they are fed upon steamed Potatoes, hay, and straw; a little Rape-cake is also occasionally given. A part of the heifer calves are reared for keeping up the stock. There are, therefore, about 100 cattle kept upon the farm. The dairy being the principal object, the cows kept are good milkers. Crossing different breeds has been much practised, but always subservient to their milking qualities. There were 13 of a cross between the Normandy and the Schwitz. One, the best, gives in the year more than 1043 gallons of milk, being at the rate of 2.86 gallons per day during the whole year.

Sheep (1100 are kept).—One portion was a cross, one part Dishley, and seven-eighths Merino; the other portion were also a cross, one-fourth Southdown, and three-fourths Merino. M. Bella has found these two crosses the best adapted for producing fineness of fleece with average produce of mutton. The cross from the Dishley and Merino was the largest sheep; would weigh, when fat, above 18 lbs. per quarter; the other cross Southdown and Merino rather less, but the carcase handsomer, appearing much better adapted for ranging over a pasture field. None of the sheep were fat, being in good holding condition. The weight of the fleece of the hogget was about 8 lbs.; but being in the grease and very full of yolk (the sheep are not washed before shearing), the weight of wool would be a little under 6 lbs.

Swine.—There are 30 breeding sows kept, all of English breeds, chiefly Berkshire and Hampshire. The average number of pigs each sow rears at each litter is between eight and nine; this, with two litters twice in the year, is 16 to 18 pigs, or, in all, upwards of 480 pigs.

Poultry.—About 300 fowls are kept, chiefly the barn-door hen of the Norman breed. There are also a few geese and ducks. The produce is sold.

Besides the common produce of the farm, silk is also produced. A "magnonerie" of two rooms, each about 12 feet square. These rooms are fitted up with shelves, on which are kept the silkworms. It was stated that 1 oz. of eggs of the worms will give per year 80 lbs. of cocoons of silk, the value of which is from 2*s.* to 3*s.* per lb. In these two small rooms can be kept the produce of 4 oz. of eggs. The quantity of food each room requires is about 200 lbs. daily. Their food is chiefly the "Murier," a tree which requires a mild climate. The Murier does not grow well further north than the region of Grignon. The temperature of the rooms for the silkworms is kept up to 75°. Fahr. Deducting attendance and the necessity of maintaining the worms at a high temperature, the keeping of silkworms cannot be profitable, except when the climate is suitable, even estimating that 1 oz. of eggs gives 80 lbs. of silk, at 2*s.* 6*d.* per lb., equal to 40*l.*

Labour.—The number of horses kept is 20. These are of various native breeds. There are besides horses, the working oxen and cows already referred to. At present they are fed upon 65 lbs. of green Sainfoin and Lucerne, with 5 lbs. of hay and 10 lbs. of Wheat-straw. The Oats allowed is 1.2 gallon. During winter they are fed upon hay, Carrot, Oats, and a little cake. They are worked 10 hours per day, the time they leave the stable being included.

Workmen.—Forty men and two females are employed upon the farm. Of the workmen, 15 (seven ploughmen and eight dairymen) are boarded and lodged. They sleep in the stables and byres. Their food is bread, meat, &c., with wine or cider. The wages are 12*l.* per annum. All the workmen upon the farm appear to be allowed cider. The wages are high; a common workman during the year receives 4 francs per day—Paris attracting the workmen from the surrounding districts. Harvesting is always done by the piece; the rate allowed is 8*s.* to 9*s.* per acre. This includes cutting the crop with the scythe, binding, and stooking.

Manures.—There is little or no outlay for portable manures; poudrette is preferred to guano, having been proved by experiment to be superior, but these are seldom used. Their use, as we understood, was confined to the experimental field, which is set apart for the students. In our attempt to explain the profit which which would result from an extensive use of guano, we were met with an assertion that the English farmer did not conserve "the manure of the farm like the French farmer," that there were manufactured annually upon the farm from 14 to 15 dunghills as the one pointed out to us. This we found to be 62 feet in length, 21 feet in breadth, and 9 feet high. The heap was composed of farm-yard manure, mixed with chalk and earth—about equal proportions of dung and chalk or earth. The stream of brown liquid which was leaving the manure heap is used for irrigating the meadows. These manure heaps being frequently watered by the use of the pump, the quantity of liquid is considerable. The top of the heap being covered by earth, and fermentation being regulated by the adding of water, the manure appears to be well decomposed previous to application. The calculation is, that a ton of such manure costs about 8*s.* With the quantity of farm-yard manure must be taken into account the system of cultivation practised. The reader must bear in mind that more than the half of the farm is under Grass, which furnishes manures for the cultivated portion. It will be seen that portable manures are not much required, the desire being to improve the farm by itself. This is deemed in France the grand desideratum of good farming, the expending of capital in purchasing manure being not regarded with much favour.

The estate of Grignon has been much improved by the above system of farming; many pieces of land which were purchased 20 years ago at 4*l.* per acre (250 francs per hectare)! and which were unsuitable for the growth of Lucerne and Clover, give now as full crops of these as land adjoining, which was at that time in value equal to 10 times as much.

The example of Grignon has exercised a powerful influence upon the farming of the surrounding districts, it being now followed in almost every detail; and so far the intention of the founders of the Association, and latterly of the Government, has been answered. As a school for teaching the young farmers from a distance, its example must be healthy; as, while the outlay for

labour and for manufacturing of manure is much above the average of French farming, the books of the farm, from being open for their inspection and for full examination, show them that it is highly profitable.

SKILLED LABOUR.

Is not skilled labour the most urgent want of the farmer? Has he any which occasions him more anxiety, more vexation, and more loss of time? In the agricultural district with which I am best acquainted, labourers who set about any operations of the farm methodically, so as to economise time and labour, and then execute them neatly and cleverly, are extremely rare. Our improved implements and machinery, and more careful tillage, render this want more and more pressing, and it behoves agriculturists to turn their attention to the early training of the rising generation of the peasantry. As respects adults, competition for prizes has been a fruitful source of improvement. Draining matches, ploughing matches, and trials of skill at thatching, mowing, sheep shearing, &c., have produced good results. I have invariably observed a manifest improvement in the execution of those operations in the immediate neighbourhood in which annual meetings for such trials are held.

Having been favoured with an invitation recently to view the admirable and extensive farm buildings at Coleshill, lately erected by Lord Radnor, from the designs and under the superintendence of his very intelligent, able, and zealous steward, Mr. Moore, of which you gave a description in the *Gazette* some time ago, I went to Coleshill without any previous knowledge of a still more interesting exhibition which came off on the same day, some account of which will, I think, interest you.

My friends and myself found on our arrival a great assemblage of all classes interested in agriculture. In the yards, a great many sheep-shearers congregated from different parts, competing for prizes in shearing some magnificent subjects from the Coleshill flock; and in a very extensive meadow some 80 or 90 mowers steadily and carefully at work on portions previously set out by measure, also competing for prizes. These were, for the most part, accompanied by their families or friends anxious for their success, and busily engaged going from plot to plot, comparing the relative excellence of the work. Young aspirants were also to be observed watching the setting on, and the various attachments to the scythe of the different mowers, the mode of sharpening, and the handling of the tool, and the character of the work accomplished; farmers and gentlemen from the neighbourhood completed the group in the meadow. I had never seen before any mowing or shearing at all to be compared with that done on this occasion, and I fancied it would puzzle the judges to award the prizes, though one of the competitors considered himself competent to this task without any hesitation, and the result gave more weight to his judgment than we had attributed to it. We asked a little wiry fellow who had been mowing, after the whole was completed, what his opinion of the performances was, and who he thought would get the first prize. He replied, "I knows who ought to have it." Who is that, my friend? "Why, I, tho' I says it." We were much amused, on hearing the call for the man to whom that was awarded, to see our friend step forward to receive it.

An additional prize was offered for competition by the veterans who were disqualified for the general competition by having obtained prizes in former years. As soon as the shearing and mowing were finished, the judges appointed proceeded to examine the work and award the prizes; and all the competitors adjourned to an extensive building in the yards, where a very abundant supply of meats, vegetables, puddings, and good beer had been provided, at long tables, which were completely filled. When the men were thoroughly filled with this substantial cheer, the good old lord, with Lord and Lady Folkestone and their friends and the visitors, entered the building, where the host and his family were received, as may be readily conceived. The men were kindly addressed by his lordship, and then, preceded by a band of music, walked up to a tent which contained an exhibition of fruit, vegetables, and flowers, the produce of the gardens of the labourers on the domain. Prizes were also given for the best collections. The competition in this case was limited to these labourers, but those given for the sheep-shearing and mowing were open to all the kingdom. The fruit, vegetables, and flowers, evidenced considerable care and skill, and would have done credit to any gentleman's gardener. After these had been inspected, and the judges had made their awards, the competitors were assembled in a circle to hear them read by the steward in the centre, accompanied by his venerable lord, who handed the prizes to the men as they were called forth. Soon after this the assemblage separated, with many a hearty blessing upon the real nobility which had conceived and so liberally provided for this most useful congregation, and with many an expression of kindly feeling to Mr. Moore, who had so zealously and successfully carried his lord's wishes into effect.

I understand there has been an annual meeting of this description at Coleshill for a considerable period. If noblemen and large landed proprietors who have the opportunities and enjoy the means of establishing such annual meetings for the like or similar trials of skill, would do that in their respective neighbourhoods, it would lead to material improvement in the performance of the ordinary operations of the farmer, and be amply compensated by the immediate gratitude of those assembled, and still more by the reflection in the widely spread and useful results to those in whose improvement in such labours we are so deeply interested. *Charles Lawrence, Cirencester, July* 21.

[We have to express our regret to Mr. Lawrence and to our readers also for the non-appearance of this paper long before this. The original copy was lost in the post-office, a fact which was some weeks in making itself known.]

Home Correspondence.

Prangos pabularia.—This valuable agricultural hay plant ought to be sown on all waste lands, whether they be wet or dry; it will last for years, produce large crops, and is an antidote to the rot in sheep. It is most strange that this plant has been so long overlooked, considering its numerous good qualities. It is well adapted for railway slopes—the seed might be dibbled in holes a foot apart, and then left to nature. Σπερμα. [The unfortunate thing is, that the seed has never yet vegetated in England—so, at least, Mr. Lawson tells us.]

Growth of Grass.—If the gentlemen assembled at Tiptree Hall were startled at the instances cited of enormous crops of Grass being grown on the western side of Great Britain, there were many who disagreed with the inference drawn by Mr. Caird, that the eastern side of the country was not adapted to the production of Grass, because Mr. Mechi had not succeeded in exhibiting this Rye-grass in such a favourable condition as his corn crops of Wheat, Barley, and Oats. The soil and the season were against Mr. Mechi, and Rye-grass alone does not seem the best kind of "seeds" for pasturing sheep, nor was his mode of turning cattle into forward Rye-grass economical or calculated to obtain a great return for green produce. The general practice is different, and numerous instances might be found, wherever deep loams or alluvial deposits occur, of a large production of Rye-grass and of mixed seeds being grown sufficient for the ordinary purposes of husbandmen to maintain large numbers of stock and provide abundance of green and dry fodder. It is true that dairy farms are more prevalent in the west from Devon and Gloucester to Chester and Ayrshire, the proportion of arable land being small as compared with permanent pastures, and a far larger quantity of rain falling than on the eastern side; but whence do the 2000 or 3000 short-horns come from that are weekly announced as a "seasonable" supply in the Smithfield Monday's market? Why, from Lincolnshire, Northamptonshire, and Norfolk; from the fens and marshes and old bullock pastures, the meadows and Grass growing districts of the Eastern Counties. Doubtless, the artificial Grasses are not so successfully grown as they may be quoted in some few favoured instances where intelligent men with sufficient capital devote themselves to this feature of agricultural economy, but that any natural impediment exists to an ample yield of Grass I must beg leave to doubt; and to excuse Mr. Mechi's Rye-grass stubble by affirming that climate alone will not permit him to grow 25 tons an acre, is approaching a "leetle bit of soft sawder;" and to recommend a monster of a crop as an example to emulate can only be compared to an invitation to grow 10 quarters of Wheat an acre, or make the produce of every farm equal on an average to the carefully-tended growth of a model cottager's garden. When instruction or advice is tendered to grown up agriculturists, undigested conclusions should be avoided, and deductions be carefully drawn when a wide field is employed in argument, or romantic incidents alone serve for illustration. *J. W., Peterborough.*

Mangold Wurzel Running to Seed.—Several of your correspondents appear to have suffered from their Mangold Wurzel running to seed this year, and attribute the cause respectively to bad seed and early sowing. The root is rather extensively grown in this district, and from personal observation and inquiry, I am convinced that the peculiar season we have experienced has been the cause of its starting so generally this year. My own Mangold Wurzel (Elvetham Long Red and Orange Globe), has run considerably. The seed, purchased from an eminent grower, was dibbled the last week in April, and the crop is a very heavy one, but I find that my neighbours who purchased their seed at other places, and sowed at different and later periods, are no better off regarding the roots running away, and have not so good crops. Whilst on the subject of roots, I may mention that Professor Buckman, in his able paper on the "Finger and Toe in Root Crops," which appeared in the "Journal of the Royal Agricultural Society," states an instance of a poor man's raising seed from White Globe Turnips two or three years together on the same plot of ground, and that finger and toe and degeneracy was the result. In this parish a piece of ground has borne Turnip seed for upwards of 40 consecutive years. The plants set for seed are sometimes taken from another field, but are raised from the original seed; here finger and toe has not been known, neither has the seed degenerated, though I believe it has never been changed, as I can testify, having used it for several years. The crop of seed this year has been a very full one. *J. B. Maunsell, Thorpe Malsor, Northamptonshire.*

Societies.

Liverpool and Manchester, *Sept.* 8.—The annual show of this Society took place at Altrincham, in Cheshire, midway between the two towns. Whether as regards the number or quality of the stock exhibited, the show was decidedly better than that of any former year. The attendance on the show-ground was very numerous. The Earl of Stamford and Warrington presided at the meeting. The toast of "The Royal Agricultural Society of England" was proposed by Mr. E. Chadwick. In eulogising the services which the society had rendered to agriculture, he stated that the "Transactions" of the society contained valuable papers, such as had never before appeared in the agricultural literature of the country. Among the papers published by the society, the last number of the "Transactions" contained an excellent article on the application of the liquid manure of towns for agricultural purposes. It had been calculated that the liquid manure in some of the large towns would serve to raise 200,000 head of cattle. It would be a great question for the agriculture of Lancashire in particular, because the manure that was allowed to go into the ditches and the solid manure that was misplaced were more than equivalent to a rent in their productive power. After addressing the meeting for some time on the modern improvements in agriculture, he remarked that no county in England had a brighter future before it than Lancashire.—Mr. Mechi, of Tiptree Hall, acknowledged the toast. Speaking of the present position of British agriculture, he said it ought to be more elevated both in profit, in sentiment, and in character. The farmer required more education and more intelligence, as well as more capital; and this state of things could only be realised by the concurrence of both landlord and tenant. Referring to the state of agriculture in Lancashire, he expressed his opinion that it was very deficient. He recommended the adoption of the system which had been pursued by Mr. Coke, of Norfolk, under which the greatest quantity of both corn and meat was produced by the farmer. What he wanted to see both in Lancashire and Cheshire was, that while they produced plenty of corn and cheese, they would produce plenty of meat also; but he told them plainly that they could not do this with their present plans. Their farm buildings were unfit for respectable farmers; their fields were too small, and their hedgerows too numerous. He had been told, but he did not believe it, that it was because game was respected that their fields were small. Now, he could not credit this, because he knew that the aristocracy of this country were ever ready to fall in with what would be for the benefit of the farmer. What the farmer in these districts wanted was to become better acquainted with the requirements of agriculture. Now, in the largest fields in Norfolk he had seen four fields for 1000 acres, and there were more partridges in the fields of Norfolk than he had seen in Lancashire and Cheshire; and how was this brought about? Why, because the farmers of Norfolk, liking to see the liberal landed proprietors enjoy their sports, drilled a few rows of Buckwheat in their Turnips, and the consequence was that there were always plenty of partridges in them. He then spoke of the benefits of the railway, which would enable farmers from one poor district to go into well-farmed districts in other parts of the country, which had been reclaimed and improved by the investment of capital and intelligence. He strongly advised the erection of an agricultural college in the county, in which agriculture should be taught as a science. Such colleges were formed in the south of England, and there was one at Cirencester in which he took an especial interest. He would say to the Lancashire people, "establish a noble college, in which the agriculture of the county should be taught." He next urged the importance of having the liquid manure of large towns like Liverpool and Manchester conveyed to the land in the country through pipes, and showed that he had himself laid down two miles of piping on his own farm for the purpose of conveying liquid manure. He assured them it would pay. He could bring down liquid manure a distance of five miles, throw it down like a shower, and spread it on the soil for three farthings a ton. He would tell the Lancashire and Cheshire farmers to do all they could to mitigate the vicissitudes of the seasons, which were sometimes so frequent here. They could only do that by proper drainage and other similar means—by putting on water where it was dry, and taking it off where it was wet. They ought to be the richest agricultural county in the world, because they not only consumed all they grew, but they also imported every imaginable thing that was good for man. He would conclude by saying, on public grounds, that his farm was open to every gentleman who might choose to carry out these great and important measures, so beneficial to agriculturists.

Among the implements exhibited in the yard was a stand by Messrs. Richmond and Chandler, of Salford and Liverpool, containing their various chaff machines and corn crushers. Their haymaking machine, combining several very important improvements, was also exhibited. In the first process of tedding or making hay it goes across the swathes, throwing the Grass in the usual manner, when having laid for a short period you can reverse the motion, and it will throw it out loosely and light, so that the air can operate upon it much more speedily than when heavily laid down. Price 16*l.* 16*s.* Their well known steaming apparatus was also shown. It consists of a 30 gallon boiler and one 4 bushel wrought-iron pan fitted on brackets to empty; the boilrr and appurtenances being complete in themselves, the whole is easy to manage.

Trafalgar, Fifeshire.—*Road Reform.*—We were unable to report a discussion of this Society on this

subject at the time at which it occurred. We make room now for an extract or two from an opening paper by Mr. Landale, of Colzie':—In the injustice of the present turnpike system, in the immense expense of collecting tolls, in the hardships to which individuals and districts are exposed from the ill-working of the numerous trusts in the county, and in the benefits which others in more favoured localities derive from the same cause, we are all at one. The fact of there being so many road trusts in the county of Fife adds very much to the expense of management, and affords a striking example of how unjustly the public pay in different districts for the use of the roads. I may mention one or two cases in proof of this. For instance, the whole inhabitants of the parish of Auchtermuchty, with a population of nearly 4000, can drive all their coals, lime, &c., and get to three, aye, five stations on the railway without paying a single toll. One gentleman who uses the roads a good deal in that district, informs me that, from this cause alone, he saves more than 50*l.* a year. On the other hand, the inhabitants of Strathmiglo cannot drive to Newburgh, a distance of six miles, without paying three tolls—the reason being, they pass over a road managed by three different trusts; whereas the inhabitants of Newburgh can drive to Auchterarder, a distance of 21 miles, without putting their hand into their pocket to pay a single toll. This certainly shows that a consolidation of the road trusts is not only desirable but absolutely necessary. By a plan which Mr. Pagan proposes of consolidating the 28 road trusts in the counties of Fife and Kinross into five, a great saving would accrue to the public and to the road trustees, and the unequal distribution of toll bars would be of rarer occurrence. As to the expense of the toll-bar system, Mr. Pagan estimates, as compensation to tacksmen, and in payment of toll collectors, a sum of about 4000*l.* per annum; and, considering there are 100 toll bars in the two counties, I do not consider this an over-estimate. If all these sums could be saved to the public—if, by any system, we could in an equitable manner raise the necessary sum for maintaining the roads without the aid of toll-bars—it must be evident that all would be gainers. Mr. Pagan proposes to abolish tolls and statute-labour assessments altogether, and to raise the necessary sum by an assessment of an annual rate on horses. I object to this part of Mr. Pagan's plan on four grounds, each of which I will notice. My first objection is that, instead of being gainers, the farmers would be losers if his system were substituted even for the present expensive and cumbersome one. Mr. Pagan estimates that an assessment of 30*s.* on each horse would be required to raise a sum necessary for the support of the roads; but that sum I consider Mr. Pagan has taken too low. Under the existing system we pay 18*s.* a horse for statute labour, and 5*s.* a horse for tolls—in all, 23*s.* a horse—a sum considerably less than what it would have been under Mr. Pagan's plan. We would therefore be losers by the change, not gainers. My second objection is, that the towns would be relieved at the expense of the country. The spirit of the original road acts bore that every one should contribute to keep the roads in repair; better far the existing extensive plan, than one which would relieve one class at the expense of another. My third objection is, that it proposes a uniform rate on all horses. If an equitable mode of taxation was to be substituted for the toll system, surely that proposition could never be deemed just which would make horses employed in agriculture pay as much as those horses that use the road 10 times as much. My fourth objection is, that if any saving is to take place in the management of the roads, the agriculturists are entitled to participate in the advantages resulting therefrom. That there would be a very considerable saving from the abolition of toll-bars, there can be no doubt, and certainly if any party has a right to receive any benefit from the sum so saved, it most unquestionably is that class who contribute most to the maintenance of the roads; but the very reverse, as we have seen, would be the effect of the change.

My proposal is, to abolish tolls and statute labour, and by a uniform assessment on the valued rental of the county and the burgh rental of towns, and also, in addition, by a rate of 1*l.* 10*s.* on all taxable horses, to raise the necessary sum for the support of the roads. The following shows how this proposition would work as regards the Cupar district—all the calculations and dates being taken from the most reliable sources :—

The annual repairs from last year's report being ...	£2095	0	0
The interest on the debt, which is 4110*l.*, at 4 per cent.	165	0	0
For salaries under this plan	340	0	0
And for redemption of debt	400	0	0
	£3000	0	0
To raise this sum, the number of taxable horses is 400, which, at 30*s.*, would give yearly	£300	0	0
And a rate of 2 per cent. on 130,000*l.*, the valued rental, and burgh rental, in Cupar district	2600	0	0
	£3200	0	0
Leaving a balance for contingencies of	£200	0	0

The assessment on valued rental, I propose, should be assessed and collected along with the county rates, which will involve very little additional expense. The assessment on burgh rental, I propose, should be taken from the assessment books made up for the support of the poor. The machinery required for laying on and collecting an assessment of 30*s.* on every taxable horse, I consider we have at present. The great recommendation of my plan is, that it is conceived in the spirit of the original road acts, which provide that not one class alone, but that all classes of the community should contribute to the maintenance of the roads. To those farmers whose valued rental is high, my proposition may not confer any great saving, but to the great majority of the occupiers of land, I have no doubt, based as my calculations are on facts, that my plan will prove of considerable benefit. To their careful consideration, then, I recommend it.

Reviews.

New York Industrial Exhibition. Special Report of Professor Wilson. Presented to the House of Commons by command of her Majesty in pursuance of their address of February 6, 1854.

The reports of the commissioners from this country appointed to indicate the interest felt by Great Britain in the progress of national skill and industry in America, on the occasion when these were to be specially represented in the Great Exhibition in New York, are among the most important of the results which seem to have followed it.

Professor Wilson's report includes those classes of objects then and there collected, having reference to "raw material," and the industries immediately connected with them, and to these were added the examination of the machines and implements used in agriculture. The mineral produce and economic geology of the States generally—the industries connected with iron, lead, zinc, copper, &c.—were pretty fully represented in the exhibition; and the *reports* upon these several departments, of course, very much more fully represent their extent and importance than could be, or at any rate *was*, done by the collection arranged within the exhibition building.

The report commences with a statement on the economic geology of the States. The first department of the detailed report includes minerals, mining, metallurgy, &c., discussed first geographically, *i. e.*, in reference to the different States contributing to the collection, and then in the order of the minerals exhibited, as—1, coals; 2, iron; 3, lead; 4, copper; 5, zinc; 6, gold and silver. The second class of objects described includes chemical and pharmaceutical products and processes. The third class includes substances used as food; and here we have a long report on the wine industry of the States, and on the produce of tobacco, on various cereal manufactures, on Rice produce, &c. From this part of the report we make the following extract on milk :—

"Preserved milk was exhibited by Gail Borden, whose preparation termed 'meat biscuit,' received a Council Medal in 1851; and by C. Alden, of New York, prepared either for direct use, or in combination with coffee, chocolate, &c. In concentrating milk for the purpose of preserving it for future use, a difficulty always presents itself in regard to the sugar of milk being so sparingly soluble in water as compared with ordinary sugars. This, by concentration of the milk, becomes crystallised, and then is with difficulty redissolved when the milk is required for use. To obviate this it is customary to remove the crystallised portion, and to substitute the more soluble cane-sugar for it.

"The use of preserved milk has increased much of late years, owing to the great increase in marine travelling; for home purpose it is now of less importance, as the facilities of railway carriage for bringing up daily supplies from wide districts of country to the large central points, are so great, that good and pure milk ought to be obtainable in all the larger cities, as well as in the rural districts. With us in London, however, constant and serious charges are made in respect to the quality of milk supplied by the dealers; and it appears upon inquiry that our friends at New York have fully as much cause for complaint as we have.

"In a recent number of 'Hunt's Merchant's Magazine,' a paper appeared containing a digest, with some additions and remarks on a pamphlet 'On the Milk Trade of New York,' published during the last winter. From this we glean some curious though unpleasant statistics, in reference to the milk supply, dating back to the period immediately preceding the introduction of country milk, through the medium of railway conveyance.

"In 1841 it was estimated that the supply of milk to the city of New York was about 16,405,000 quarts, or 45,000 quarts daily, a very small portion of which was pure; the entire trade being in the hands of the swill milk manufacturers. Now (1852) the total consumption amounts to 270,000 quarts daily, or nearly 100,000,000 quarts annually. According to the returns of the four principal railways, carrying milk into New York, for the year 1851, we find that there were carried by the

	Quarts.		Dols.	Cents.
Haarlem Railroad ...	12,634,178	selling at	63,120	89
Erie Railroad	12,610,556	„	63,052	78
Hudson River Railroad ...	596,338	„	2,221	72
Newhaven Railroad ...	90,732	„	4,336	69
Total ...	26,658,404	„	132,726	08

"The returns for the first year of 1852 again show a considerable increase, the quantities being by the—

	Quarts.	Freight.
		Dols.
Haarlem Railroad	7,789,318	38,946
Erie Railroad	6,402,230	32,011
Hudson River Railroad...	684,688	2,996
New Haven Railroad	621,220	3,126
Jersey Railroad	482,000	945
Ramape and Patterson Railroad ...	182,500	637
Steamboats	273,750	912
Barges	273,750	1,365
Total	16,709,456	80,938

giving a total amount for the year equal to 33,418,912 quarts, or 182,826 quarts per day; from which it appears that the supply of country milk in 1851-2, more than quadrupled the entire supply in 1841. In 1842, the year after the opening of the Erie Railroad, the quantity of milk brought up amounted to 388,505 quarts; last year (1852), it nearly reached 13,000,000 quarts. Thus much for country milk; but another great source of supply exists—the swill milk manufactories in and about the city. According to the best estimates, these furnish a supply about double that obtained from the country, being somewhere about 60,000,000 quarts per annum, or 160,000 quarts per day.

"It appears also that both the country and the swill milk are adulterated by the dealers to the extent of one-fourth of the original amount; this would give us something like the following amounts for the annual consumption of New York :—

	Quarts.
Country milk brought	33,418,912
Swill milk	60,000,000
Per-centage of adulteration to country milk ...	8,000,000
Ditto to swill milk	15,000,000
Total	116,418,912

and would require an annual outlay by the consumers equal to about 5,500,000 dols., which, taking the population at about 600,000, would give an average of 9 dols. 16 cents per head for the supply of milk, equivalent to about 204 quarts per annum, or ·56 of a quart per day per head.

"Notwithstanding the cheap rate of railway carriage, and the great inducements both to suppliers and consumers to encourage that mode of supplying the market, the swill milk trade increases still more rapidly. The number of cows kept for the supply of country milk is estimated at 10,000, having a value of 250,000 dols. Those kept in the city and its vicinity are estimated at 13,000, and valued at 200,000 dols. These latter are fed almost entirely on 'swill'—distillery wash. This is carried for 3 or 4 miles round to the outlying establishments. The adulteration of the milk seems to be the act of the city dealers, very little taking place in the country districts; however, even the doctored and sophisticated country milk is considered far preferable to the swill milk.

"The largest establishment in the city is at the end of Sixteenth Street, by the North river, which contains, in three parallel rows, from 600 to 700 feet in length, large cow stables, having altogether accommodation for nearly 2000 cows, and extending from the Tenth Avenue down to the river. In these stables they are confined in very close order, in a heated and tainted atmosphere, and are fed upon the 'swill,' with which their feeding troughs are liberally furnished. Occasionally a small quantity of other food, as hay, meal, &c., are given. It requires about a fortnight before the animal will take to the food, after that the average consumption by each cow amounts to from 28 to 30 gallons per day, for which a charge is made of 6 cents per day per head. No litter is allowed for bedding, and the accumulation of filth is painfully evident as you approach the premises. The effect upon the health of the animal soon becomes evident; the jaws are affected, the hair falls off, and the ulcerated condition of the hoofs renders it difficult to keep it on its legs. Nevertheless, on all occasions, when practicable, it is rendered available to the slaughterer. The loss by deaths is 12 per cent. per annum. Another large establishment exists in Fortieth Street, where the cows are kept in a manner quite as bad as the foregoing; and in Williamsburgh, adjoining an extensive distillery, may be seen a similar establishment where the cows are forced together in a still more reprehensible manner. Here, indeed, the mortality is frightful, averaging from 60 to 65 per cent. annually."

The fourth class of objects reported on, including vegetable and animal substances used as food, forms a very interesting portion of the report. Cotton, wool, and flax are, of course, the principal objects mentioned, and full statistical statements inform the reader very satisfactorily on the progress and present condition of American produce under these three heads.

It appears that "in 1840 there were 19,311,374 sheep, furnishing 35,302,114 lbs. of wool, or a fleece equal to 1·84 lbs. per head. According to the returns in 1850, the number of sheep was 21,721,814, producing 52,789,174 lbs. of wool, which is equal to 2·43 lbs. per head. It would appear from these comparative statements that not only has the sheep farming of the States been successful in regard to numbers, which present a very satisfactory appearance, the increase in the decennial period amounting to about 12 per cent., but also that a great improvement had taken place in the breeds, as the average weight of the fleece has increased in the same period from 1·84 lb. to 2·43 lbs., or about 32 per cent. In some of the States where sheep-farming is more particularly attended to, the results have been even more encouraging."

The rest of this section of the Report is devoted to an account of the pork manufacture of the country, from which we have made some extracts, and published them in a past number of this Paper. On the report of agricultural implements exhibited, we postpone our remarks, and conclude for the present with this general commendation of the Report, that not only should it receive, as it doubtless will, the attention of those more intelligent among us who desire to be informed of agricultural progress and position in other countries within the same parallels of latitude as ourselves, but that others also who read merely for immediate professional benefit, will find it to be their interest to study its pages.

Miscellaneous.

Flax Crop of 1854: Ireland.—The following police report on the Flax crop of the present year has been compiled, by the express desire of His Excellency the Lord Lieutenant, out of the regular course of the agricultural police reports, in compliance with the desire of, we believe, the Belfast Flax Society, in order to obtain reliable statistical details of the amount of the crop—rendered, now, of the greatest importance to the linen trade by our present unhappy relations with Russia. By it we learn that the present crop is less by 15,341 acres than the crop of last year; this is certainly a very considerable falling off, and one that will, no doubt, be severely felt by our manufacturers, who cannot make good the deficiency from the Russian ports. However, much as this serious reduction in the area is to be deplored, we believe that the crop of this year is far superior in quality to that of last year, which will, in some degree, compensate the loss. The Belfast Society and the *Farmers' Gazette*, very early in the season, urged this important subject on the attention of our agricultural classes, with, we are sorry to see, so little effect. The saving of Flax-seed has also been repeatedly urged upon them, which, we trust, a perusal of these very opportune returns will excite them to, with more effect than the former advice respecting the breadth of Flax for fibre; and we hope that the coming season will find our farmers more alive to their interest than they have been. The country is well able, and highly suitable, for the production of Flax of superior quality; and we put it to the farming classes, whether it be right to leave ourselves depending on a foreign supply of not only Flax but any other commodity that we can produce, and from which, if dependent, we may be very unceremoniously cut off, at a very short notice.

Return of the Acreable Extent of Flax in Ireland in 1854, compiled by the desire of His Excellency the Lord Lieutenant, in anticipation of the General Tillage Returns:—

The agricultural returns for 1854 have not yet been received from several constabulary districts. As to them, the extent of Flax for this year has been estimated from the best available information, and also from the returns of 1853. *William Donnelly, Registrar-General, in Dublin Farmers' Gazette.*

The Value of Winter Oats for Feed.—I think many farmers, and amongst them will be found some of your readers, are not aware of the value of winter Oats as a spring feed for sheep. Sown either alone or with Tares, they are very valuable, on account of their keeping eatable so much longer than any other corn; from the amount of sap the stem contains, they do not get hard. In the middle of September last year, I sowed Tares after harvesting winter Oats, and the wasted Oats coming off with the Tares made a valuable piece of early feed, and although the sheep were six or eight weeks eating them, there was no waste from being too old. I have seen great waste with Rye and Barley this season, which has induced me to mention the advantage of sowing winter Oats instead. If they are fed early in the spring, they can be left for seed after, and no other kind of Oats are so good for feed, generally weighing 40 lbs. per bushel, and upwards. *A Wiltshire Farmer, in Bell's Messenger.*

Notices to Correspondents.

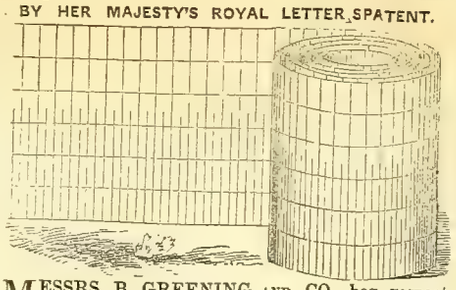
ADDRESS. We have a letter for Mr. J. R. Pearson, but are unable to address it.

ANALYSIS: *H W N.* You had better apply to Professor Way, 32, Hollies Street, London. We are not sure of his terms, but they no doubt vary according to the questions asked.

SMALL FARM: *A Youngster* may grow what crops he pleases. If he will tell us his object, we might suggest a plan of cropping, but can hardly do so otherwise. Is it to be a dairy farm, or a market garden, or a corn farm on a small scale—or what? If a good year's money produce is wanted, it might answer to grow seeds, as Mangold Wurzel, or Turnips, or Carrots, arranging beforehand for the sale of the produce.

*** We shall be glad to communicate personally with "Constant Subscriber."

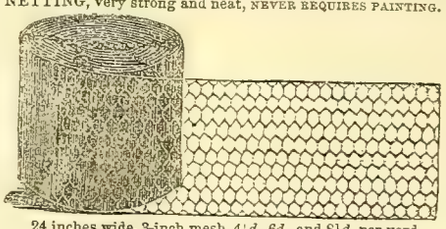
BY HER MAJESTY'S ROYAL LETTER SPATENT.



MESSRS. B. GREENING AND CO. beg respectfully to call attention to their superior WIRE FENCES, of which the following are the principal varieties:—Portable Horse and Cattle Fencing (Economical variety of ditto), Portable Sheep and Lamb, Proof Fencing, Poultry Fence, Portable Hare and Rabbit-proof Fencing, Ornamental Garden Fences, Export varieties, Poultry and Chicken-proof Fencing. Light and cheap kinds of most of the above. Trainers for Peas, &c., Garden Bordering, Tree Protectors, Hen Houses, Poultry and other Aviaries, &c.

Messrs. B. G. & Co. being the sole patentees for the machinery for manufacturing these Fences, will forward engraved sheets of Patterns, Prize Lists, Prospectuses, &c., gratis, on application to their establishments, 1 and 3, Church Gates, or 2 and 2 A, Cateaton Street, Manchester.

H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1½-inch " light " ...	8 "	6 "
1½-inch " strong " ...	10 "	8 "
1⅜-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

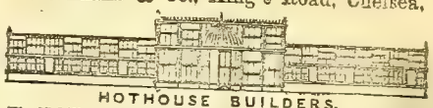
EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, ENGINEER, Battersea.

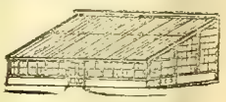
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



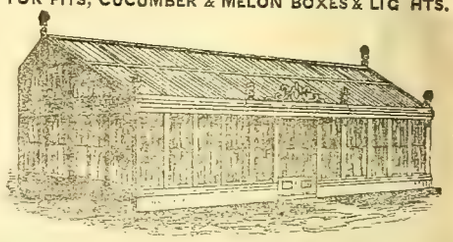
The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS, FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.



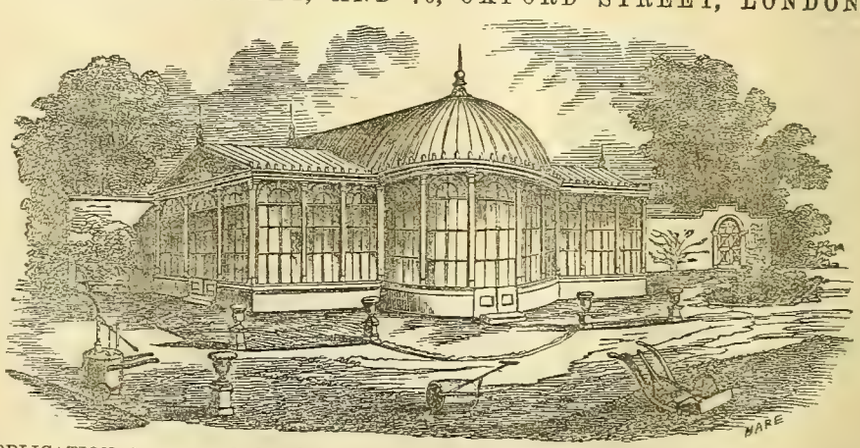
JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

COTTAM AND HALLEN,
2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.
AGRICULTURAL LIST UPON APPLICATION.
EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.
EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who, on application, will forward wholesale and retail prices.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

WARNER'S PATENT FARM AND COTTAEG PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

PURVEYORS OF LIVE BIRDS

BY SPECIAL APPOINTMENT TO HER MAJESTY AND H.R.H. PRINCE ALBERT.

DISEASES OF POULTRY.

BAKER'S POULTRY RESTORATIVE, having been used for many years with uniform success, is recommended with the greatest confidence; and will be found invaluable during and after the periods of the various Exhibitions. Not least among its many advantages being the easy manner in which, in its liquid form, it is administered, and thus obviating the troublesome necessity of handling the birds. Great economy will result from the use of the RESTORATIVE in the improved condition and well-doing of Poultry, in testimony whereof an inspection of the extensive and choice Collection at the Pheasantry is invited.

"It cannot but be extensively brought into use."—*The Field*, Jan. 7, 1854.

Price, with full directions for Roup, &c., 2*s.* 6*d.*, either in Liquid or in Pills. May be obtained through any respectable Chemist.

BAKER'S REGISTERED POULTRY, PHEASANT, AND PIGEON FOUNTAIN is gradually and surely supplanting all others, being found the most simple, useful, and economical.

"We have seen the Fountains; they look well, and cannot fail to answer. Being well made of strong metal, are durable and cheap."—*Gardeners' Chronicle*, Feb. 12, 1853.

"The article is both neat in appearance and durable, and will no doubt meet with a great sale; it deserves it."—*The Field*, March 19, 1853.

Price—4 quarts, 6*s.* 6*d.*; 9 quarts, 8*s.* 6*d.* Drawings by post.

S. C. and C. N. BAKER, City, and the Pheasantry, Chelsea.

EGGS—HATCHING MADE EASY.

MINASI'S PATENT INCUBATOR.—The Patentee of this most successful and cheap mode of Incubation is now ready to supply the Public with his Machine at the following very low prices:—For Hatching and Rearing 100 Eggs, 8*l.* complete, including two burners and two reservoirs, and the regulating stand; for 200 Eggs, 12*l.*; for 360 Eggs, 18*l.*; for 500 Eggs, 25*l.*; and for 1000 Eggs, made to order, 40*l.* 100*l.* challenge against any other Incubator in the world, and the further sum of 100*l.* to 50*l.* against any machine with top contact.

Mr. C. M. will, upon the receipt of a postage stamp, have much pleasure in forwarding full printed particulars of his Improved Method of Hatching, with impartial testimonials in favour of it.

Address, Brecknock Place, Camden Road, London.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, 296, Oxford Street, London.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt.

HARTLEY'S PATENT ROUGH PLATE, for Roofing Conservatories, Halls, and Public Buildings.

PLATE, CROWN, and SHEET WINDOW GLASS.

Coloured and Ornamental Glass of every description.

Glass Milk Pans, Pails, Tests, and Measures; Cream Pots and Syphons; Churns, Butter Tests and Slabs; Tiles and Slates; Bee Hives, &c.

Moore's Patent Ventilator and Lockhead's Patent Perforated Glass, for Dairies and Greenhouses.

Aquavivariums, Fern Shades, Propagating Glasses, Fruit Protectors, Preserve Jars, Cucumber Tubes, Hand Lights, Flower Vases, Labels, &c., and all kinds of Agricultural, Horticultural, Architectural, Domestic, Scientific, and Ornamental Glass, British and Foreign, at the lowest prices.

CLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

CLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

NURSERY AND SEED BUSINESS.

ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the old-established NURSERY and SEED TRADE at Taunton, Somerset, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required, the quantity of ground may be reduced. The Nursery is five minutes' walk from the Railway Station.—For further particulars, apply to Mr. M'INTOSH, the Nurseries, Taunton; or to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

TO BE LET, MARKET GARDEN GROUND, within 12 miles of London, adjoining the Great Western Railway. About 11 acres of excellent ground, with nearly half a mile of brick wall, 14 feet high, and having a south-west aspect.—For terms, apply to Mr. MEEKING, Danley Court, Uxbridge; or to Mr. PETER BROAD, Auctioneer, 29, Tavistock St., Covent Garden.

TO NURSERYMEN AND OTHERS.

TO BE LET, at Epsom, Surrey, the EPSOM NURSERY, late in the occupation of Mr. Young, being about 4½ acres. For particulars enquire of MRS. WILKINS, 60, Queen's Row, Walworth.

TO BE SOLD, GREENHOUSES — a bargain. One 12 feet long and 8 feet wide, 15*l.*; and one 21 feet long and 12 feet wide, 25*l.* Plans and particulars sent on receipt of a postage stamp, to Mr SMITH, Builder, &c., 1, Lower Street, Islington Green. Greenhouses and Garden Lights, Window Sashes, Doors, &c. from 6*d.* per foot. Country orders forwarded.

TO BE SOLD, the NURSERY STOCK of PETER BOOTH, NURSERYMAN, Falkirk, who, wishing to retire from business, would give a Lease of all his Nursery Grounds, which belong to himself, to a person wishing to pursue that line of business. These grounds are cropped with a most excellent, healthy, and general stock of Nursery Plants, of which a good bargain could be got, and the good-will of the business, which has been carried on in a very favourable locality, formerly by his relatives and latterly by himself, for more than 70 years past, and with great success.

TO GARDENERS, FLORISTS, AND OTHERS.

TO BE SOLD, a NURSERY and FLORIST'S BUSINESS, with a good connection of Jobbing, &c. The Stock can be reduced to suit the purchaser.—Apply, by letter only, to J. H., 3, Edward Street, Hampstead Road, London.

TO BE DISPOSED OF, Six CYGNETS in very fine condition, and of good size.—Apply to H. T. HUMPHREYS, Kilmacow, Waterford.

SPANIELS.

WANTED, a Brace of well-broken SPANIELS, two years old.—Address, stating price and colour, Beta, *Gardeners' Chronicle* Office, London.

WANTED, a COCK and one or two HENS, healthy, white common PHEASANTS.—Address (post paid, priced, packed, delivered, at a Railway Station), R., Wrington, Bristol.

BRAHMA POOTRA CHICKENS.

TO BE SOLD, a few very prime Birds of the above breed from imported stock. The white pure, and hackles well pencilled, short-legged, and well feathered. Also a few remarkably diminutive White Bantams.—Address Y., Box 36, Post Office, Great Yarmouth.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

TO IRONMONGERS, NURSERYMEN, AND SEEDSMEN.

The Trustee on the Sequestrated Estate of HAMILTON LAIRD, Cupar Fife, is prepared to receive Tenders for the following subjects, either together or separately, viz.:

1. THE IRONMONGERY STOCK AND FITTINGS in Shop and Cellars at the Cross of Cupar, consisting of a new and well assorted class of goods fitted for the trade of the district, and valued at about 1050*l.* The Lease to Martinmas 1858 of the Shop, &c., and Dwelling-house above, may be obtained along with stock if desired. The Shop is in the very best position for the trade of the town and district, and has been occupied as an Ironmongery Shop for the last 50 years. It is seldom that so good an opening for a profitable business occurs.

2. The LEASE of the NURSERY situated about half a mile to the south of Cupar on the Edinburgh Road, well known throughout the whole Eastern District of Fife for the last 50 years, together with the valuable and well-selected Stock therein, of Forest Trees, Shrubs, Flowers, &c. The extent is about Five Acres, and the Lease is current for 13 years from Martinmas next at a rent of 35*l.* The Stock is in the very best condition for an immediate entry, and is valued at about 500*l.*

3. A STOCK of SEEDS in Lofts, consisting of Rye Grass, Clover, Turnip, Cabbage, Garden Seeds, &c., valued at about 90*l.*

Sealed Tenders to be lodged on or before the 26th inst., with ANDREW TAYLOR, Bank Agent, Cupar, the Trustee; or W. A. TAYLOR, Writer, Cupar, either of whom will show the Stocks and Valuations, and furnish further information.

Sales by Auction.

KINGSTON, SURREY.

MR. J. C. STEVENS is directed by Mr. Bruce to sell by Auction, on the premises, Ham Lane, Kingston, Surrey, on THURSDAY, 28th September, 1854, at Twelve for One o'clock precisely, 4000 HEATHS, including Hyemalis, Wilmorea, Cavendishi, Sindryana, Ventricosa, Perspicua nana, pyramidalis, gracilis, and other good sorts; about 100 of the true Acacia Drummondi, some of them specimens; 500 Gardenia radicans, Fortuni, and intermedia: 500 Clianthus puniceus, and other well-grown Plants, deserving the attention of Amateurs and the Trade.—May be viewed on the day prior and morning of sale, and Catalogues had on the premises, and of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

TO MARKET GARDENERS, NURSERYMEN, & OTHERS.

MR. W. T. ATWOOD will sell by Auction on WEDNESDAY, September 27, at 12 for 1 o'clock precisely, on the premises, near the Coach and Horses, Turnham Green, Middlesex, all the Live and Dead Stock, comprising excellent Block and Spring Waggons, Dung and Market Carts, Barrows, two powerful Cart Horses, Sets of Harness, 100 three-light Cucumber Frames, 1200 Bell and Hand Glasses, a quantity of Baskets, Implements, and Tools, Garden Pots, and a number of useful articles. May be viewed the day previous and morning of Sale. Catalogues may be had at the Roebuck Tavern, Turnham Green; the Rainbow Tavern; and Mr. Way's Coffee House, Covent Garden Market; and of Mr. Atwood, Land Agent, Mortlake, Surrey.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

CONSIGNMENT FROM BELGIUM FOR ABSOLUTE SALE.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, October 22, at 12 o'clock, about 600 Double Camellias, 800 Indian and Ghent Azaleas, &c., with a few first class Dutch Bulbs. On view the morning of Sale.—Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

BINFIELD ROAD NURSERY, STOCKWELL.

TO NURSERYMEN, AMATEURS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by the Proprietor, who is retiring from the business, to offer to public competition by Auction at the Mart, Bartholomew Lane, on MONDAY, September 18, at 12 o'clock, the valuable Lease of the above Nursery, of which 80 years are unexpired, consisting of 1½ acre of Land, walled round; also a substantial brick-built Cottage, Greenhouses, Sheds, Stock in trade, &c. May be viewed any day previous to the sale. Particulars may be obtained on the premises; of Mr. WEEKS, Solicitor, 10, Tokenhouse Yard, Bank; and of the Auctioneers, American Nursery, Leytonstone, Essex.

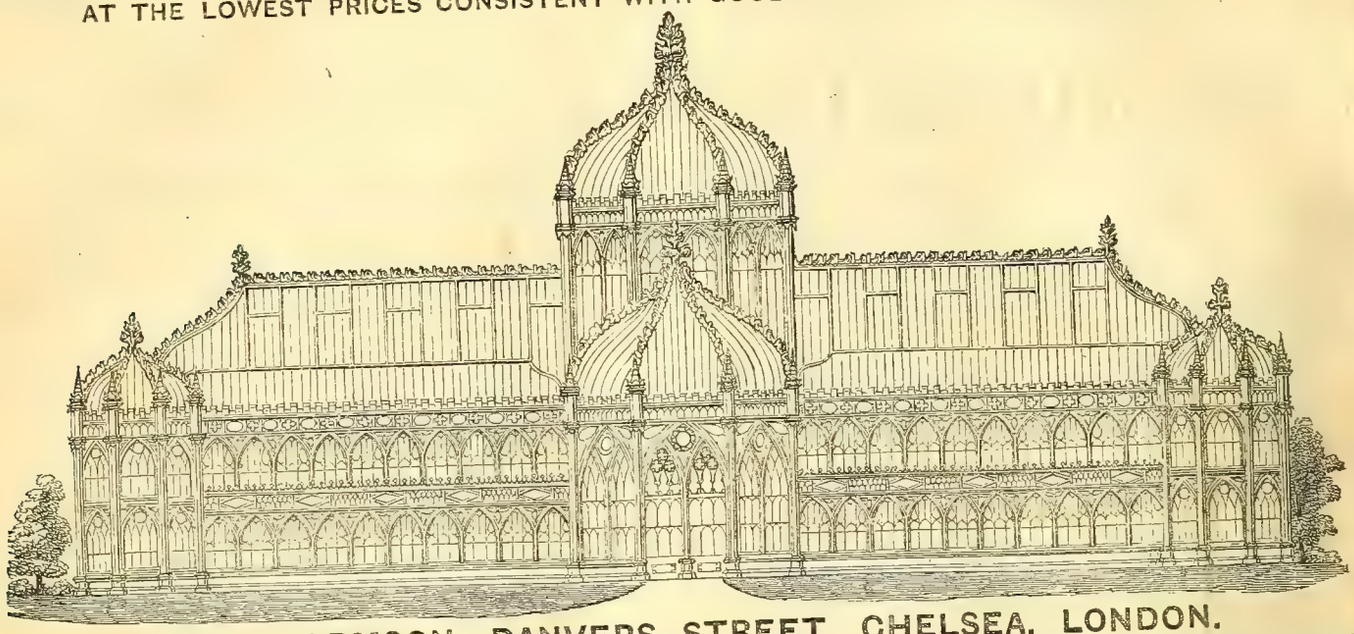
CLAPHAM.

TO NOBLEMEN, GENTLEMEN, EXHIBITORS, NURSERYMEN, & OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the administrators of the late Mr. Joseph Fairbairn to submit to an unreserved Sale by Auction, on the premises, the Nurseries, Clapham, near London, on TUESDAY, Sept. 19th, 1854, and following day, at 11 o'clock each day, the valuable stock of Choice GREENHOUSE and STOVE PLANTS, which is particularly worthy the attention of noblemen and gentlemen enriching their collections, as well as the trade, from its excellence, comprising about 4000 fine Ericas, of all the leading kinds, amongst which are magnificent specimens of Massoni, Massoni major, Tricolor elegans, Cavendishi, Templæa, Metulæflora, Douglassi, Easonia purpurea, Austiniana, Vestita coccinea, Aitonia Turgida, Princeps Templæa, Murrayana, Favoides elegans, Ferruginea, Ventricosas, sorts, &c.; also 500 choice Azalea indica, 1000 double Camellias, 1000 Epacris, 500 Aphelexis, Mitraria coccinea, Acacia, Chorozema, Dillwynia, Diosma, Lilium lancifolium, &c. &c.—May be viewed two days prior to the Sale. Catalogues to be had (6*d.* each, returnable to purchasers) on the Premises; at the Shop, High Street, Clapham; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex. N.B.—The Lease of the old-established Seed Shop and Nursery to be Sold; the Stock to be taken by valuation or agreement. For particulars, apply to the administrators, or Mr. JAMES FAIRBAIRN, on the premises.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

Just published, price Twopence,

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.
They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.
Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.
Pine-apple Place, Edgeware Road, London.

HOLLYHOCKS.—A collection of this fine old English flower, grown at the Cheshunt Nurseries, is now in bloom, and there will be a succession till the end of October. Admirers of the Hollyhock are respectfully invited to visit the Nurseries to inspect them. In addition to the choicest varieties of other growers, there are many rare and beautiful kinds of their own production, and to be seen only at their grounds.—A. PAUL & SON, Nurseries, Cheshunt, Herts (13 miles from London, on the Cambridge line of Eastern Counties Railway).

Berberis Neubertii, new and hardy, with beautiful foliage, fine young plants, 15*s.* each; and strong, 30*s.* each.
A. V. G.'s New Catalogue of Plants, just published, may be had from his Agent, Mr. R. Silberrad, 5, Harp Lane, Great Tower Street, London.

CATTELL'S EARLY BARNES CABBAGE,
,, ,, RELIANCE ,,
,, GREEN COLEWORT ,,

Plants of the above are now ready, 5*s.* 6*d.* per 1000, stout bedded; 4*s.* 6*d.* per 1000 good seedlings. No charge for crates, baskets, or packing. Packages of 5000 or more, delivered to the Edinbridge Station, South-Eastern Railway, carriage free.
Orders from unknown correspondents to be accompanied with post-office orders made payable here.—Address,
JOHN CATTELL, Westerham, Kent.

"OMAR PACHA" STRAWBERRY.

WILLIAM JAMES WARD is now sending out well rooted plants of the above excellent Strawberry, which was awarded a Medal by the judges at the Royal Botanic Gardens Exhibition, July 5th, 1854. It has also been submitted to Mr. Marnock, Mr. Spencer, Mr. Thompson, and several practical gardeners, who have all pronounced a favourable opinion of it. Also by Mr. Powell, of the Royal Gardens, Frogmore, in the descriptive list of new Fruits, in the "Florist and Fruitist" for the present month, accompanied with a woodcut.

Prospect Hill, Reading.—Sept. 23, 1854.

MAY'S EARLY ASH-LEAVED KIDNEY POTATOES, free from disease, 10*s.* per bushel, 14*s.* per cwt., 12*l.* per ton, sacks included.
EARLY FORTYFOLD POTATOES.—The editor of the *Gardeners' Chronicle* says, "These are a well-known kind, of good quality; a good cropper, and is found by us to be quite as early as the Ash-leaved Kidney, if planted early, escaping all disease, yielding immense crops." They are of the red kind, and round. 8*s.* per bushel, 11*s.* per cwt., 9*l.* per ton, sacks included.
Address, HENRY MAY, The Hope Nurseries, Bedale, Yorkshire.

LISIANTHUS RUSSELLIANUS.

J. AND J. FRASER beg to offer the above, in strong and healthy plants, such as will make large specimens for flowering next season, at 2*s.* 6*d.* each.
Lea Bridge Road, Essex, September 23.

STRONG VINES FROM EYES.

THOMAS PERKINS begs to draw the attention of purchasers to the above, which are very good, and true to name, at 30*s.* per dozen. The usual discount to the trade.
Atherstone, Warwickshire.

PRIMULA SINENSIS.

T. AND T. HAYES begs to offer their fine fringed varieties of Red and White PRIMULAS; fine strong plants, in 60-sized pots, ready for shifting, at 6*s.* per dozen, packing and carriage, included to any railway in London. All orders from unknown correspondents to be accompanied with a Post Office order payable to T. & T. HAYES, Edmonton, Middlesex.

DUTCH BULBS.

JOSEPH HARRIS begs to announce that he has received his annual consignment of Bulbs from Holland, comprising the best sorts of Hyacinths, Tulips, Crocuses, Narcissus, &c. They are very fine and moderate in price. Catalogues may be had on application. Cheltenham Road Nursery, Bristol.

CLARKE AND CO., WHOLESALE AND RETAIL SEEDSMEN AND FLORISTS, 86, High Street, Borough, London, beg to say they have imported a choice collection of DUTCH BULBS (which are not to be surpassed by any other house in London), and they will be happy to forward Catalogues upon application. Terms, cash, or a reference in London.

R. SMITH is now sending out his New Seedling Strawberry, SIR CHARLES NAPIER, the best forcing one of the day, admired by all who have seen its growth, and for colour not one to equal it.—Price, 3*l.* per 100; 50 for 30*s.*; 25 for 15*s.*
R. SMITH, Market Gardener, Richmond Road, Twickenham; or G. GLADMAN, Salesman, Covent Garden Market, London.

DICKINSON'S ITALIAN RYE-GRASS SEED is ready for delivery (by permission of Mr. East), from 7, Curzon Street, May Fair, London, as before. 7*s.* per bushel for present payment only. Post-office orders Piccadilly.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s.* per dozen. The above bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place, London.

LILIUM LANCIFOLIUM, TRITONIA AUREA, AND VALLOTA PURPUREA.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to say that his extensive collection of the above BEAUTIFUL PLANTS is now in flower, and may be viewed every day (Sundays excepted). Admittance gratis.
H. GROOM begs to state that his CATALOGUE OF BULBS for this autumn is ready, and will be forwarded by post on application.

NEW PROLIFIC POTATO.

WM. B. JEFFRIES, ARBORETUM NURSERIES, Ipswich, is now prepared to send out his New Seedling Potato, which he can with confidence recommend, as being the best ever grown for Autumn or early planting; it is an abundant cropper, very early, and has always proved free from disease. The *Gardeners' Chronicle* thus speaks of it at p. 552:—"It is a very nice Potato, with a particular even surface, which prevents waste in peeling."—Price per peck, 3*s.* 6*d.*; or per bushel, 12*s.*

STRAWBERRIES.

WILLIAM NICHOLSON is now sending out strong well-rooted Plants of his four new and distinct Strawberries, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy; RUBY, ditto, a great bearer, and forces well; CAPTAIN COOK, market fruit, large, and a great bearer; FILLBASKET, ditto: 400 Plants of the above sorts for 2*l.*; 200 do., 1*l.* 4*s.*; 100 do., 15*s.*; 50 do., 10*s.*; box included. Most of the old and new sorts can be supplied.
*** See Mr. J. W. KINMONT'S remarks on the above Strawberries, printed in No. 31, 1854, page 501, of this Paper.
Post-office Orders, payable at Yarm, Yorkshire, or a cash remittance required with the order.
Egglescliffe, near Yarm, Sept. 23, 1854.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.
J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.
Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50*s.*; 50, 30*s.*; and 25, 16*s.* Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5*s.* per 100.
Manor Farm, Deptford, September 23.

GOLIATH STRAWBERRY.—This well tested and excellent variety has now outgrown all the prejudice that has been raised against it, and has fully borne out the high character which was at first given of it; and most, if not all the market gardeners in this neighbourhood, as well as gentlemen, are growing it very extensively. It has proved itself to be the very best in the absence of its parent, the British Queen, or where that variety does not succeed.
A Post-office order for 3*s.* 6*d.*, or stamps to that amount, will secure 100 strong well-rooted plants, package included; or 1*s.* 6*d.* for six plants, by post, to any part of the kingdom. Also Trollope's Victoria, the very best for forcing, 3*s.* 6*d.* per 100.
Also the following varieties at 2*s.* 6*d.* per 100:—Keens' Seedling, Elton Pine, Myatt's Surprise, Comte de Paris, and Hooper's Seedling.—JAMES KITLEY, Lyncombe Vale Nursery, Bath.

CHRYSANTHEMUMS.

R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's selection at 9s. per dozen.

CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4s. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9s. per dozen. List of names forwarded upon application. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Rad, Islington.

CHOICE NEW GERANIUMS, FUCHSIAS, ETC.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, begs to state that he will be prepared to send out nice plants of Foster's, Hoyle's, Beck's, Dobson's, and Henderson's New Geraniums, sent out last autumn, early in October, well established in 4-inch pots, at 36s. to 40s. per dozen. All the Choice New Fuchsias, sent out last spring, 1s. 6d. to 2s. each, or 18s. per dozen. New Verbenas, sent out in spring, 1s. each, or 9s. per dozen. New Petunias, sent out in spring, 1s. 6d. each, or 15s. per dozen. Choice New Cinerarias, 2s. each, or 18s. per dozen, or 6 for 10s.; older ditto, 6s. to 9s. per dozen. Pansies, newest and best varieties, 18s. per dozen.—Carnations, Picotees, Pinks, &c. &c., equally cheap.

Descriptive Lists of the above may be had for one postage stamp.

SWEETWILLIAMS.

"THE most extraordinary movement that has ever taken place in the floral world." Such is Mr. Glenny's opinion of Mr. HUNT'S SWEETWILLIAMS, in the "Horticultural Journal," for July 15, 1854.

The "Florist," for August, in its report of the National Floricultural Society, says, "Mr. BRAGG exhibited a very fine collection of Mr. Hunt's Sweetwilliams, remarkable for form and texture, the petals being stiff, smooth, and well rounded, and varying in colour from white, with carmine centres, to brilliant crimson."

The editor of the "Midland Florist," in the number for August, describes them as "round, smooth on the edge, close in the truss, distinct in colour; in fact, beautiful in the extreme."

See also "Midland Florist," for September, 1853.

In the "Gardeners' Record," for September, 1853, Mr. Neville pronounces them as "large, perfectly smooth, and possessing properties worth the notice of amateur florists, and will, no doubt, if sent out, soon become general favourites."

W. BRAGG, of the Star Nursery, Slough, has much pleasure in informing the admirers of the above new and truly beautiful Flowers, that he is now prepared to send out strong healthy Plants, at 7s. 6d. per dozen.

The usual Allowance to the Trade. A list of those Nurserymen who ordered Plants will be published.

JAMES IVERY AND SON, NURSERYMEN, &c., Dorking and Reigate, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEA INDICA and RHODODENDRON PONTICUM COCCINEUM, which will be ready for delivery in October next. The Advertisers beg to say they can recommend them with the greatest confidence as being superior to any others of their kind. The Azaleas were figured in the "Florist" for July, 1852, at which time the editor remarked as follows:—"As regards the beauty of the flowers little need be said, as the representations will speak for themselves; they have been much admired, and will, no doubt, speedily find their way into every collection." Again, in the same journal for June, 1854, the editor says:—"Your two Azaleas, Admiration and Criterion, are certainly very beautiful, and fully maintain the opinion expressed of them, at page 137 volume for 1852, when we figured them." Criterion is a very fine bold flower; size, shape, and habit of that old favourite Iveryana; colour, light salmon, distinctly margined with white, and thickly spotted with deep crimson on the upper petals; 21s. each. First-class Certificate at the National, April 20, 1854—the only time it has been exhibited since it was figured. Admiration is a medium sized flower, of greater substance than the former, with the same shape and habit; colour pure white, with broad flakes of carmine, resembling the marking of a Carnation; 21s. each. Has not been exhibited since it was figured, owing to an accident to the flowering plant.

RHODODENDRON PONTICUM COCCINEUM.—This is the finest crimson variety ever offered to the public; it is a free bloomer, with a fine large truss of brilliant crimson, being brighter than the old Arboreum, and perfectly hardy. Dr. Lindley, in this journal (page 342), says:—"This fine variety has the deep crimson flowers of the red tree Rhododendron, which was evidently one of its parents, and the foliage of R. ponticum, which it resembles in all respects except in colour—thus uniting the brilliant flowers of the tender Indian kind with the hardy vegetation of the Black Sea.' 21s. to 63s. each. Has received three Certificates of Merit. A few extra-sized plants of both Azaleas at 42s. each.

The above have been ordered by most of the principal nurserymen, and many of the nobility and gentry.

N.B. Figured Plates of the two Azaleas may be had by enclosing nine postage stamps to either of the above-named Nurseries. A remittance, or reference, is respectfully requested from unknown correspondents.

Reigate Nursery, September 23.

NEW HARDY CONIFERS.

HUGH LOW AND CO. announce to their friends and the public that they have been appointed by Messrs. Parsons & Co., of Flushing, New York, Sole Agents in this country for the sale of the undernamed CALIFORNIAN CONIFERS. The Plants are raised from seed, and will be delivered as soon as the growth of the present season is sufficiently matured. THUJA GIGANTEA (Nuttall); *synonyms* LIBOCEDRUS DECURRENS (Torrey); THUJA MENZIESI (Douglas); THUJA CRAIGIANA (Jeffreys).—A magnificent species, and the most desirable Tree known to exist in California. It was discovered by the botanists of the United States Exploring Expedition, and is described by Professor Torrey, in "Plantæ Fremontianæ," as growing near the upper waters of the Sacramento, from lat. 38° 40' to 41° N. He also states it is a noble tree, attaining a height of 120 to 140 feet, with a trunk 7 feet in diameter, rising from 80 to 100 feet without a limb. This tree will be perfectly hardy, and will take the foremost rank amongst our ornamental trees, as the foliage is most beautiful, reminding an observer of some of the more graceful species of Lycopodium.

The Plants when delivered will average 1 foot to 1½ foot in height, and being of such unusual size for a new Conifer, will produce an immediate effect. Price 31s. 6d. each.

ABIES NOBILIS.—This well-known Fir requires no description. Plants from seed have long been desiderata, and those now offered are strong and well shaped, from 6 inches to 1 foot in height. Price 31s. 6d. each.

In addition to the above, H. L. & Co. have to offer from the same source strong Plants of several species of hardy CALIFORNIAN PINES, collected in districts little explored. Amongst them will be found Pinus Jeffreyana, Pinus Parryana, offered for the first time; and judging from the CONES of the different species, it may with certainty be inferred that several others will prove entirely new to this country. Price 84s. per doz.

Messrs. Parsons & Co. having been successful in raising these fine Conifers in considerable numbers, have determined on offering them at the low prices quoted above, with a view to insure their speedy introduction into every collection in Europe.

Discount allowed only when twelve plants of a sort are taken.

Clapton Nursery, London, Sept. 23.

DUTCH FLOWER ROOTS.

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth, have just received, direct from one of the first establishments in Holland, a very large assortment of

DUTCH FLOWER ROOTS,

comprising all the best varieties of Hyacinths, Tulips, Ranunculuses, Anemones, Gladiolus, Iris, Liliums, Crocus, Ixias, and all other kinds of Flowering Bulbs.

They are all come to hand in most excellent condition, and will insure satisfaction to all purchasers.

FRUIT TREES.

G. C. also begs to state that he has a large stock of Trained Trees, Apricots, Peaches, Nectarines, &c., which are very fine; they being planted on maiden soil, have remarkably fine wood and fibrous roots. Also a fine stock of every description of Evergreens, Coniferæ, &c. &c.

N.B. Catalogues may be had on application at the Nursery, Streatham Place, Brixton Hill, Surrey.—Sept. 23.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
„ insignis, 2 to 7 feet
„ Menziesi, 3 to 7 feet
„ pinsapo, fine plants, 3 to 6 feet
„ Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
„ nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
„ Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
„ thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
„ chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
„ Irish, 4 to 10 feet
„ gold-striped, 1½ to 3 feet
„ do., tall standards, 4 to 7 ft.
„ Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
„ Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2d. stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

NEW FRENCH GERANIUMS.

JOHN SCOTT, FLORIST, Bathford, near Bath, can supply the following nine spotted FRENCH GERANIUMS, with a plant of Extravaganza and hamper included, for 1l. 1s. J. S. has proved them to be beautiful for bedding, as well as for pot culture. They continue flowering the whole of the summer. Auguste Midley, Colonel Foissey, Edoile des Jardins, General Cavai, Gustave Odier, James Odier, Jaques Duval, Madame Lamoriciere, Triumph de la Tour.

The following new Geraniums of last year:—Carlos, Governor General, Regalia, 5s. each; Majestic, Zeno, Lady Bird, Rosa, 3s. 6d. each.

The following, 18s. per dozen:—Optima, Leonora, Lagoma, Cordelia, Medora, Eleanor, Kulla, Queen of May, Rachael, Butterfly, Challenger, Portia, National, Astrea.

The following, 10s. per dozen:—Ambassador, Ariadne, Enchantress, Elise, Magnet, Mochanna, Lord Mayor, Lablache, Ganymede, Flying Dutchman, Purple Standard, Magician, Pulchra.

The following new Fancies:—Constance, 3s. 6d.; Lady Hume Campbell, Mary Howitt, The Ocean Queen, and Illuminator, 2s. 6d. each. The above are nice Plants, and could not fail to please. Post Office orders, payable at Bath, are requested from unknown correspondents.

MUSHROOM SPAWN.

To MUSHROOM GROWERS, GENTLEMEN'S GARDENERS, NURSERYMEN, SEEDSMEN, AND THE TRADE IN GENERAL.

S. CHEESE begs to inform his Patrons he has now ready for delivery, and in fine condition, a large STOCK of his far-famed SPAWN, that has stood the test upwards of 50 years, and never known to fail. Any quantity can be safely packed and forwarded to any part of the world, on receipt of Post-office order.—Address, 231, Oxford Street (late of the Flora Gardens, Bayswater), London.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the Crystal Palace, Sydenham, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. Conservatories and Aviaries fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. Window blinds of every possible description, of the very best materials and workmanship.

N.B. An allowance to nurserymen and the trade.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 11s. per ton; ditto, delivered 5 miles, 16s. per ton. Loam and Peat at moderate prices.—KENNARD BROTHERS, Swan Place, Old Kent Road, London.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

THE CONICAL HOT-WATER BOILERS, as invented by John Rogers, Esq., are only to be obtained of JOHN SHEWEN, IRONMONGER, Sevenoaks, Kent.

Contracts given for Heating.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

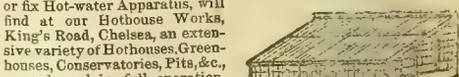
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, ENGINEER, Battersea.

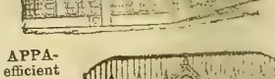
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

NEW BULB CATALOGUE.

E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, Lond n, begs to inform the public that their Catalogue of Bulbs is now published, and will be forwarded post free on application.

The collection is selected with much care, and they would draw particular attention to the Hyacinths which have been proved in their nursery to possess those properties for which this tribe is celebrated, viz., brilliant colour, close, compact truss, and good habit. The Dutch collections have such a number of cheap varieties which are offered to the London market, that it is requisite for them to be proved before being offered to the public.

Among the other lists of Bulbs, they would call attention to the Gladiolus, particularly to Section III. (hybrids of Gandavensis), and can recommend such as Fanny Rouget, Monsieur Blouet, and Couranti fulgens, as possessing first-rate merits.

NEW CLIMBING HYBRID PERPETUAL ROSE,
THE "DUCHESS OF NORFOLK."

To be sent out for the first time about the end of October.

WM. WOOD AND SON have much pleasure in offering the above superb Rose to the notice of their Friends, feeling assured it will prove entirely distinct from any Rose at present known, and which cannot fail to give every satisfaction. The colour is a bright vivid crimson, the under side of the petals most delicately shaded with a fine glossy pink, presenting a pleasing contrast; but the most valuable property of this superb variety consists in its extraordinary vigour, and as a perpetual-flowering dark-coloured Climbing Rose surpasses any variety that has yet been offered.

Standards, Half Standards, or Dwarfs will be supplied at 10s. 6d.

A very liberal allowance to the Trade. N.B. The above will be figured in the October number of "The Florist."

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

SEED POTATOES: the "BRITISH QUEEN."—The above variety is well worthy of the attention of private growers, where yield and quality are objects. They do not require any forcing, and are ready to take up in May, and quite ripe in June. Numerous testimonials have been received from parties who had small quantities sent on trial last season. The following is from Mr. J. Basting, Gardener to Mrs. Kemble, Birkfield Lodge.

"Sept. 16th, 1854.

"Sir,—The quarter peck of British Queens you sent me last year on trial have produced me over two bushels of very fine Potatoes; they are the best crop that I have seen for the last 20 years, and I have much pleasure in recommending them to your numerous customers.—J. Basting, Gardener to Mrs. Kemble, Birkfield Lodge, Suffolk."

Price 30s. per sack of 16 stone; this includes Carriage paid to London and sack. All orders must be accompanied with a remittance.—A fresh supply of the Early Short-top Ash-leaf Kidney will be ready to send out on Wednesday next, price 30s. per sack.

JOSEPH WILSON, Seed Potato Merchant, Ipswich.

STRAWBERRIES.—*This is the best time for planting Strawberries, especially after the late rains we have had. The Subscribers have a very superior stock of the following choice varieties:—*

INGRAM'S PRINCE OF WALES.—The principal sort grown at Frogmore for the Royal table, 20s. per 100.

PINCE'S NIMROD—highly recommended by Lucombe, Pince, & Co., 40s. per 100.

NICHOLSON'S AJAX ... ... } Four excellent varieties,
" RUBY ... ... } fully described by Mr.
" CAPTAIN COOK } Nicholson. Price 7s. 6d.
" FILLBASKET ... } per 100.

TROLLOPE'S VICTORIA—A very superior and most prolific variety, 5s. per 100.

CUTHILL'S BLACK PRINCE—5s. per 100.

KITLEY'S GOLIATH—5s. per 100.

All the other choice varieties in cultivation. For prices and further particulars, consult RENDLE'S NEW AUTUMNAL CATALOGUE, *just out, to be had in exchange for two penny stamps.*—Apply to

WILLIAM E RENDLE AND CO., SEED MERCHANTS, Plymouth.

HYACINTHS ... ... 4s., 6s., and 9s. per doz.
ANEMONES, best double varieties ... ... 5s. per 100.
RANUNCULUS " ... 3s. to 5s. "
CROCUS ROOTS, very large ... 1s. 6d. to 2s. "

And all other kinds of Dutch Roots, imported direct from the first houses in Holland, at the lowest remunerative prices.

Apply to WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth.

THOMAS JACKSON AND SON, having a large healthy Stock of STOVE, ORCHIDACEOUS, and GREENHOUSE PLANTS, respectfully invite intending purchasers to an inspection; in addition to the established favourite kinds will be found many novelties now offered at very low prices.

Kingston, near London.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 23, 1854.

In our notice of the efforts which had been made by the Hop growers, near Maidstone, we inadvertently made a misstatement with respect to the Hop garden, near Leeds, in which tobacco had been used so perseveringly to destroy the aphis, before the mildew made its appearauce. The garden in question is occupied by Mr. THIRKEL, than whom no one has taken greater pains to counteract the prevalent maladies. Under any circumstance we should be anxious to correct the error, but in addition to considerations of mere justice, we are desirous of doing so, because it gives us an opportunity of stating that he had not confined his experiments to the use of crude sulphur, but has employed GRISON'S fluid too. Although, however, he found it beneficial in the early stages, in a more advanced period of growth it discoloured the Hops, and was, in his opinion, less efficacious than the older remedy. Mr. BANNERMAN, of Hunton, has also used GRISON'S mixture, but he prefers the sulphur, under an impression that the powder remains longer in the plant, while the liquid application soon disappears. This has always been the great objection to its use in the case of the Vine mildew, though in that disease confessedly more speedy in its effects than crude sulphur. The same objection does not, however, apply to the sulphuret of potassium employed by M. BECQUEREL for the same purpose, inasmuch as the addition of a small quantity of acid causes the precipitation of the sulphur, which, in the form of what was called by the old chemists a magisterium or impalpable powder, lines the minutest cavity or inequality. The sulphur happily is not detrimental to the quality of the Hops, as, even in the absence of all disease, a certain quantity is generally applied in the kiln. In all such questions comparative expense is as necessary an element as comparative efficacy; and the raw sulphur is so beneficial, its application so easy and simple, and its use attended by so small an outlay, that without better evidence than exists at present, the experimental cultivator alone can be expected to resort to other means. *M. J. B.*

"BEWARE of amateur theorists; they are dangerous men. They mean to fill your pockets, but they only succeed in emptying them." We venture to address these words of advice to all concerned in manure speculations, and who expect an Elysium to be produced by city cesspools. Nor is the warning needless; for in the eagerness to get rid of the offensive matter of towns, everybody is disposed to believe all the fine things that anybody will tell them, provided the speaker has a sufficient stock of such words as sanatory, augmented productiveness, organic matter, ammonia, phosphoric acid, gaseous decomposition, precipitation, fermentation, and similar learned terms. Never was caution more needed than at the present moment, when municipalities are besieged by all sorts of sewage and drainage projectors.

About the year 1846 a friend of ours, a common sense kind of person—a sort of horticultural GRADGRIND—known to understand these questions, was entreated by the secretary of a nascent sewage company to give his opinion to the young board of directors which had undertaken to watch over the interests of the juvenile speculation. He was assured that the directors attached great importance to the expression by him of a favourable opinion of the plan. "It will be the making of the company, I assure you, if you declare yourself in favour of our scheme," said Mr. Secretary; "and there can be no doubt that you will entirely approve of it, as soon as the details are fully explained; for Mr. RETORT, the eminent chemist, and Mr. EDWARD GRADIENT, whose merits as an engineer you of course acknowledge, have been our advisers." Thus solicited, our friend consented to be present at a Board meeting, and there to express his opinion of the project. Without the loss of a moment he was ushered into the presence of a cluster of eager-looking gentlemen, among whom he recognised the face of an Essex farmer of some celebrity. Nothing could be more gracious than the chairman, or more smiling than the secretary. The latter explained for the Board the scheme of a vast system of drainage, that was to clear a whole quarter of London of sewage, to render the neighbourhood more fertile than the banks of the Nile, to quintuple the crops of market gardeners and farmers, and to be an inexhaustible source of profit to the patriotic shareholders. Not the persuasive voice of a SCARLETT, nor the eloquence of a CANNING, could have produced such effect as the glowing narrative of the secretary. Visions of high premium and fat dividends floated before the eyes of his auditors, and they seemed to have forgotten the presence of their horticultural adviser, whose opinion was evidently expected to be an echo of the secretary's speech. As soon, however, as mutual congratulations ceased, the stranger addressed the chairman to the following effect:—

"I have listened, sir, with great pleasure to the highly interesting statement of the honourable gentleman who has now sat down. Nothing can be more admirable than the arrangements which have just been explained; or, as far as I can judge, more certain to purify one of the most densely peopled neighbourhoods of this large metropolis. I think, sir, you are completely justified in saying that, if the Legislature should give you power to carry out the proposed plans, you will be entitled in every sense of the word to the name of public benefactors. (Hear, hear, hear.) I say, advisedly, public benefactors; for you will have restored health to a most sickly district, and you will have reduced the chance of future contagion to a *minimum*, regardless, as all true patriots are, of the consequences to yourselves. That those consequences must be rather serious will be evident from the single fact that the works of construction alone require an outlay of something more than a million sterling. Now, a million sterling is a considerable sum; indeed, I may call it, without exaggeration, a very considerable sum for any body of gentlemen to devote gratuitously to the public service. (Here the secretary hinted something which was inaudible to all but the speaker.) I am told, sir," he continued, "that is is not the intention of this company to expend their capital gratuitously; be the intention what it may, I cannot entertain a doubt that such will be the result; for—gentlemen—the—scheme—cannot pay."

It would be difficult to describe the sensation produced by this unexpected announcement. "Not pay!" cried the chairman. "Not pay," repeated the imperturbable GRADGRIND.—"Do you mean to say, sir, that sewage is not the richest of all manuring substances?"—"Suppose it is, how will you render it portable?"—"Oh, that is provided for; we shall filter it and run off the water."—"Very well; but the only valuable part is the water and the substances dissolved in it, and that you propose to waste."—"Oh! but Mr. RETORT has pointed out a highly scientific mode of precipitating all the soluble matter, so that we shall have that after the water is run off."—"That will not render your solid matter any better."—"No better! why, sir, you told us just now that the best part of sewage is what is dissolved in the water; and that we shall precipitate and save, so that your objection falls to the ground."—"Not at all. Let me explain. Your manure is intended to fertilise the soil, that is to say to put crops through a course of high feeding. But plants can only feed on what is soluble. When Mr. RETORT tells you he saves the soluble matter by precipitating it, you do not seem to perceive that he effects his object by rendering it insoluble, or, in other words, by bringing it into a state in which plants can make no use of it. It is, therefore, clear that the only valuable part is still practically wasted, although it is no longer run off with the water; for you will observe the solid matter can derive no advantage from being incorporated with that which, although once valuable, has ceased to be so."—"Then are we to understand, sir, that it is your deliberate opinion that the solid matter of sewage has no value?"—"It has very little; hardly so much as would pay for cartage; it will rank with clay, or sand, or chalk, all which have some value when properly applied, but not such as justifies their being even called manures." Here the interview terminated; and it is needless to add that nothing more was heard of that patriotic and enlightened sewage company.

This is no fictitious narrative. One reader, at least, of this paper will remember the occurrence, and we trust with gratitude, for it perhaps saved him from utter ruin.

The off-hand opinion expressed on the occasion in question has just received entire confirmation from Mr. WAY, whose report upon the use of town sewage as manure is an elaborate explanation of the real facts which belong to this most important subject. (See *Journal of Royal Agricultural Society*, vol. xv., p. 135.) His words are these:—

"We learn that of the fertilising matters of sewage, by far the largest portion exists in the liquid state; that the solid portion has not even the agricultural value of ordinary excrement, far less that of night-soil, to which we are unthinkingly in the habit of comparing it; that the liquid is so largely diluted with water, that any attempt to concentrate it is totally out of the question; that the greater number of plans that have been proposed for the production of a solid manure from sewage are only so far valuable that they assist in the separation and filtration of the matter in suspension, which, as well as the liquid, they deodorise and render manageable. Thus, we have seen that charcoal does not retain the ammoniacal or alkaline salts, and in no way adds to the value of the solid refuse, except in rendering it inoffensive and in assisting its desiccation; that lime is merely useful in the filtration and deodorising of the sewage, whilst on the other hand it introduces into the solid manure a large proportion of useless matter; that the salts of alumina, iron, and zinc, deodorise and coagulate, but nothing more; and, finally, that the processes which really are adapted to the separation of the soluble fertilising matters of the sewage, namely, those in which salts of magnesia and compounds of silica are employed, may altogether fail of success on account of the diluted character of the liquid and its other solvent properties.

"But there is a further difficulty, and one which may prove insurmountable. The manufacture of solid manure from sewage, to be successful, must furnish an article of such value as to bear the expense of carriage to a considerable distance. It is not in the immediate neighbourhood of towns, where stable manure and other fertilising matters are abundantly available, that the product of the sewers is most wanted, or would be most appreciated. The market gardens in the neighbourhood of London and other large towns will always have the command of abundance of manure, which is obtained at a very low cost and with little or no expense of carriage, being brought by the market carts in their return journey. The market for sewage manure ought to be found in a wider zone. I feel persuaded that *cheap* manures—that is to say

manures of small value, at an equally small price—are a mistake, and every step that we take now is in the opposite direction, namely, in the concentration of fertilising qualities. If, then, in the act of producing sewage manure in the solid state *a low per centage* of manuring ingredient is obtained—the great bulk of the manure being useless to vegetation—such a result is a failure, not a success, however much of the manure may be produced.

"It may be asked, Is there then no plan by which a solid manure of sufficient value can be prepared from sewage? My own conviction is that, as yet, no plan has been suggested which, with a due regard to the farmers' interests, unites the prospect of a paying speculation. Of course I speak now of a manufacture in which sewage is the staple raw article. It is quite possible to mix other matters, such as the refuse substances of large towns, with the solid deposit of sewage, so as to make a good manure, at a fair or even a low price; but in this the merit lies with the substances added, not with the sewage itself; and such a manufacture is obviously very partial and limited in its application.

"It has always appeared to me that this question of sewage-water is regarded in a wrong light. A most exaggerated opinion of the prospects of manufacturing manure from it is entertained by local Boards of Health, and town corporations. Not content with making arrangements by which the removal of the refuse and the cleansing of their watercourses is to be obtained, they in many cases stipulate for a rental for the right of taking the sewage matter. I do not doubt that if the *liquid sewage* could be properly distributed over the extent of surface which it is capable of fertilising, a revenue would be forthcoming towards the reduction of the town-rates. But, *in the absence of arrangements for liquid distribution*, and unless we should discover some process far better than any we possess for the solidification of the sewage, I am convinced that the results must be all the other way: that is to say, the towns must be content to *pay* towards the operation, instead of looking to it as a source of income. The question is indeed a compound one—sanitary and agricultural. It is of the utmost importance to the town populations to remove their refuse matter without polluting the neighbouring streams. By the aid of existing processes this object can be satisfactorily accomplished; and the water supplied to a town may be restored to the watercourses in a comparatively unobjectionable form. But the manure so produced cannot be sold at a profit—unless, indeed, the farmer, by giving more than its value, is made to pay for the sanatory improvement of the towns. It is useless to urge that a manure made in this way can be sold, and has been sold, largely at an amply remunerative rate. No one who is acquainted with the nature of farming operations, and with the difficulty of estimating and tracing to their true source the effects of manure, will doubt that for a time even the very poorest manures may have a sale, particularly if the price is temptingly low. But this state of things does not last: and the price at which the solid sewage manure will ultimately find buyers will be below the cost of its production.

"*The true policy of towns is to take this matter, in some shape or other, into their own hands. Their primary concern should be to effect the sanatory objects thoroughly, looking to the manure as a set off, greater or less, against the expenses incurred in securing the increased health and cleanliness of their populations.*"

We heartily join in the advice given in the paragraph marked in italics. It is very improbable that the cost of town drainage can be repaid by the sale of town sewage, except, perhaps, in places peculiarly situated. Towns must execute their drainage irrespective of money returns; and must be contented if gardeners and farmers will carry it away for them; beyond that, should they be able to make anything of it, let them take it gratefully as a partial set-off to their expenses.

If, indeed, the "arrangements for liquid distribution," to which Mr. WAY refers, and upon which Mr. CHADWICK and Mr. MECHI so ably insist, should be carried out economically, the question will assume a different form. But those arrangements are not made, nor are likely to be made very soon. When they shall have been carried into effect on a scale commensurate with the magnitude of the important work of removing the liquid metropolitan sewage in its natural condition, we shall then think that the dreams of enthusiasts are approaching realisation; for it is in its fluid undoctored state, and in no other, that town sewage can be made to pay the cultivator.

MANY of our readers having, doubtless, occasion to TRANSMIT valuable PLANTS BY RAILWAY, it may be useful to direct their attention to an important statute just passed, and called "The Railway and Canal Traffic Act, 1854." Since railway companies have acquired a virtual monopoly in the carriage of goods between distant places, they have, as is well known, been accustomed to deliver to the sender of valuable goods a ticket with a notice endorsed to the effect that the company will not be answerable for any loss, however occasioned, and have then been permitted to escape the payment of damages, even in cases where the goods have been injured by the gross negligence of their servants.

This disgraceful state of the law is fortunately at an end, for by the above statute, § 7, it is enacted that every company "shall be liable for the loss of or any injury done to any horses, cattle, or other animals, or to any articles, goods, or things, in the receiving, forwarding, or delivering thereof, occasioned by the neglect or default of such company or its servants, notwithstanding any notice, condition, or declaration made and given by such company contrary thereto, or in anywise limiting such liability, every such notice, condition, or declaration being hereby declared to be null and void." And although there follow several provisions which somewhat restrain the above clause, a person can, we hope, be no longer told to keep his things at home or to send them by persons who shall not be liable for damage arising from their own want of proper care.

VEGETABLE PATHOLOGY.—No. XXXVIII.

168. Many observations have been recorded in favour of the action of an increase of electricity on the germination of seeds and the growth of plants. A series of experiments were, however, carefully conducted at Hawkstone, as recorded in the Horticultural Transactions for 1847, vol ii., p. 42, in which plants and seeds were either isolated on stools with glass feet, or electricity was communicated by induction, by means of wires, both under glass and in the open air, and the result, except in one solitary instance, capable of explanation by other considerations, was certainly opposed to the idea of much influence being exerted by free electricity on the growth of plants under ordinary circumstances. In most cases where marked differences have been exhibited, as in the different action of the copper and zinc wires of the galvanic battery, chemical conditions were present capable of accounting for any increased activity, apart from any direct agency of electric or galvanic fluid.

168. It was observed, for example, by Sir H. Davy that seeds germinated in pure water at the positive portion of the circuit far more rapidly than under ordinary conditions, while at the negative portion they did not germinate at all; but then the water in the one part gave out oxygen and in the other hydrogen, which are respectively favourable and unfavourable to germination. Becquerel, however, found that the germination of seeds placed in contact with the copper extremity was accelerated, while those in contact with the zinc was retarded, the negative extremity accelerating, the positive retarding the process. This he attributed to the effects of negative electricity on the decomposition of salts by which alkali was set free, which is known to promote germination by neutralising the acetic acid which is formed during the process.* The same acute observer made many other experiments with a view to ascertain the action of electricity on the processes of vegetation; and though allowing the existence of some influence, he arrived at the conclusion that whatever this might be, it was exerted in the promotion of chemical action, and not in any special and independent effects. The application of an alkali in fact produced the same effect in accelerating germination, and of an acid in retarding it, as the negative and positive wires of the battery.

169. Though, however, it does not appear from more recent observation that the effect of electricity is very powerful in the promotion of the growth of plants in general, or possibly even of germination, it is very conceivable that where a plant is already in a low state of vitality, or, in other words, in a condition in which it has a tendency to disorganisation, it may have a powerful effect in promoting decay. That electricity accelerates the putrescence of animal bodies, and promotes acetous fermentation in vinous liquids, are facts which are matters of common notoriety; and we can easily conceive that where the constituent chemical elements of a plant are not in their normal condition, a strong absorption of electric fluid may have a very powerful effect. On such considerations only can we allow the mischievous effects of electricity in promoting disease already present; the probability of the effect of a current from the atmosphere to the plant upon organs in a healthy condition of active vitality would be an increase of vital energy; the contrary, of course, might be predicated of a contrary direction, which is however of comparatively rare occurrence, and the advocates of the electric theory of disease have not attempted to show the prevalence of such an inverted action during the years in which disease has more especially prevailed in certain portions of the vegetable world. It is, however, probable that a state of equilibrium is the most conducive to the maintenance of health, and for the most part everything tends to keep up this equilibrium both in the plant itself and its component parts. *M. J. B.*

* The conversion of starch into sugar, which is perhaps universal in the germination of phænogams, gives rise to the elimination of carbonic acid, and also to a portion of acetic acid.

THE BACAXI PINE-APPLE.

IN the year 1851 our correspondent, Mr. Graham, of Cranford, sent us suckers of a Pine-Apple from Para, called the Bacaxi; with the following note. "The fruit of this variety was of a handsome long conical form, rich red orange colour, and very high flavour. I never tasted so good a fruit. It weighed 7½ lbs." These suckers were entrusted to Mr. Fleming, of Trentham. When received by him they were nearly dead, and blanched as white as writing-paper; and when they began to move the growth was so weakly that he doubted for some time if ever they would do more than give a fruit as large as an egg. In this he has been agreeably disappointed, for at last a fruit has been produced weighing 4 lbs., with all the indications of being a large sort when more vigorous; he believes that 8—10 lbs. will not be unattainable.

The specimen shown us answers to Mr. Graham's description in all respects. Its perfume was delicious, and its flavour more rich and delicate than that of any firm white-fleshed sort with which we are acquainted. The variety seems to be quite distinct, and a valuable addition to those already in cultivation.

SOME PRINCIPLES OF VEGETABLE PHYSIOLOGY,

BEARING ON THE CULTURE OF PLANTS.

By Professor W. H. DE VRIESE, of the University of Leyden.

(*Translated from the Dutch.—Continued from p.* 598.

A PLANT cannot live, but much less grow, by means of water only; however, water performs here a very important service, for it conveys much of that which must be a means of nourishment to the plant. The substances under ground, whether they have their origin from dissolved remains of plants or animals, or are of an earthy nature, contribute, in fact, to the formation and development of the plants substances which are found in the ashes of burned plants. Potash and soda, *e. g.*, form a principle of the composition. The former substance is prepared in great quantities from wood ash; the soda is manufactured from many plants found on the sea-shore. Lime, one of the substances which are most scattered through the whole of nature, is likewise present in almost all plants. Investigation proves to us that in plants many other substances known to us as solid bodies exist; the water dissolves those substances either as such or united with other bodies, and so they penetrate the plants. Thus water is chiefly the fluid through which matter is conveyed; but when we observe how great a mass of such substances exists in plants, and how small a quantity of them may be dissolved in the water, if, on account of too great a degree of density, it is not in a state to penetrate the plants, then we must be convinced of the immense quantity of water which must pass through a plant during its whole life, before it has attained its full development and finished its whole growth.

If the use of the evaporation to the plant must be measured by the degree in which it takes place, we may be sure that it is indeed of the greatest service to its vegetation. We can prove this by remarkable examples.

At the end of the 17th century, an English naturalist, Stephen Hales, wrote a book, entitled "Vegetable Statics," in which he described the following observation: A Sun-flower, which was 3½ feet high, evaporated during a very hot day 1 lb. 14 oz. of water. The evaporation averaged per day 1 lb. 4 oz. He observed that plants with hard wood and evergreen leaves evaporate less than those which fall off, such as Cabbage leaves, leaves of Apple trees, and others. However, it is not easy to make such experiments, for the evaporation of the soil in which the plants are must not be computed; and if the amount of the evaporated substance is to be exactly determined, it is necessary to inclose the plants. Attention must also be paid to the condition of the tissue of the mass of which the leaves consist. But, above all, the extension of the surface over which the evaporation takes place during a certain time must be known, and also the exact quantity of water which is required by the root. A thick cuticle, hard like leather, such as is found in succulents, Houseleek, Crassula, and Aloe, evaporates little, and these plants want but little moisture. They grow often on stones and rocks. On the contrary, the more tender the leaves and the thinner their membranes are, the more they perspire; and the greater the number of leaves the more liquid the stem must supply. The leaf of a Linden tree has a mean size of 0.01 □ metre; the amount of both surfaces is thus 0.02 □ metre. If a Linden tree has 25,000 leaves, the amount of all the leaves makes a surface of 500 □ metres, consequently 2000 trees make a surface of 593 □ miles, or the extent of the kingdom of the Netherlands.

We readily confess that this calculation may not be precisely correct, or it may be even exaggerated. We allow that to determine the number of leaves can be only an approximation. Yet, we dare pretend that many a tree has half a million of leaves, and that the extent of the leaves of many a large well-wooded estate surpasses that of the whole Netherlands. If, after these considerations, we remark how luxuriant nature is between the tropics, how gigantic are the trees, how luxuriantly the plants grow under those huge trees, and how elevated is the temperature, then it may be explained why there is an incessant dampness in those forests, on account of which they are often impenetrable; and in what is their relation with the state of the atmosphere on account of the continual evaporation on the surface. It would require a series of experiments

to determine the quantity of moisture evaporated by a single tree. What we can say of it now rests greatly on an approximation, for the foundation of which an experiment was made on another plant many years ago. If each Linden leaf evaporates from June to October, during 137 days, the 5000th part of a pound of water, the mass of liquid which passes through a tree, covered with 25,000 leaves, is of 171⅛ cubic metres. This approximation must be, however, far beneath the truth.

(To be continued.)

CYRTOCERAS REFLEXUM.

Although not one of the most showy of plants this is certainly one of the most useful, being, under proper management, covered with its clusters of rather pretty and singular-looking flowers for several months at a time; they are produced from the axil of almost every leaf on the young wood, and the flowers remain long in perfection. But to have it in perfection it requires to be grown in a close, moist, warm temperature, and enjoys a gentle bottom heat; and unless these conditions can be afforded it, there will be little chance of having it in a thriving state.

Propagation is easily effected by means of cuttings of the rather firm young wood, which root readily under a hand-glass in bottom heat. The cuttings should be potted singly in small pots as soon as they are well rooted, and replaced in a moist, warm temperature, affording them bottom heat until they become well established, if possible; shade slightly from bright sunshine, keeping the atmosphere thoroughly moist, and sprinkling the plants frequently over-head, but water very cautiously at the root, for a soil saturated with water is very injurious to this plant. As soon as well established, the point of the shoots should be pinched out, and they will require to be stopped occasionally as they progress in growth, if a bushy habit is to be secured; but this is of no importance in the case of small plants, as, if allowed to grow in the form of a single shoot, this can be coiled round stakes which, with stopping, will cause the production of numerous shoots. Young plants should not be kept growing too late in autumn, for unless they are afforded a period of rest, in order to thoroughly mature the wood, they will not break so freely the following spring. As soon as the object is to ripen the wood, the plants should be placed near the glass in a rather dry atmosphere, where they will be exposed to light and air on favourable occasions—and where they may remain for the winter, giving very little water to the soil. Except an occasional wipe to clear the foliage of dust, the syringe should not be used; and at this season the temperature should not fall below 50°, nor rise above 60° without a circulation of air. Towards the middle or end of January the plants should be placed in a growing temperature, such as directed above, giving sufficient water to the soil to thoroughly moisten it, and repotting them as soon as the roots make a start. But before inducing growth, the shoots should be stopped and brought down, to cause them to break freely and assume a bushy habit. If well attended to, affording them a moist warm temperature, with a moderate bottom-heat, nice little specimens will be obtained by the end of the second season, and they will grow more freely if the flowers are picked off as they make their appearance, for these will be produced from the axil of almost every leaf on the young wood. Attend to stopping and training as may be necessary during the growing season, giving a second shift if requisite, and winter them as already directed. Plants for flowering will require exactly similar treatment to that recommended for growing them; and if they are placed in bottom-heat early in spring, and otherwise properly cared for, they will be in flower in May; and if kept in bottom-heat, &c., will go on growing and flowering till late in autumn. Or if desirable to remove them to a cooler place, this may be done; and the blossoms will last long in a cool dry atmosphere, but others will not be produced to succeed them, as is the case when the plant is retained in heat. See to getting the wood well-ripened annually before winter, and cut back and trim the specimens as may be necessary, before inducing growth in spring, and immense bushes will be obtained in the course of a few years.

As this Cyrtoceras is impatient of any excess of moisture at the root, a hard fibrous peat should be used, such as water will pass through very freely; this should be broken up into small lumpy pieces, rejecting the fine, and mixed with about one-third its bulk of charcoal, broken small, and a moderate quantity of sharp white sand. In potting avoid large shifts, and secure efficient drainage by using plenty of potsherds, and covering them with some fibry pieces of soil. *Alpha.*

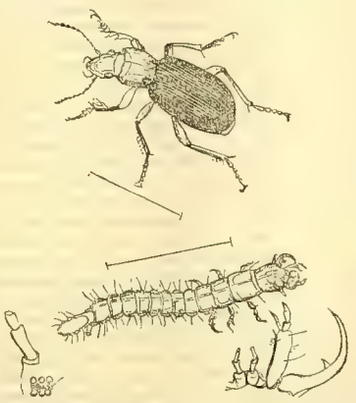
ENTOMOLOGY.

Steropus madidus.

Is the earth-worm beneficial or obnoxious to the horticulturist? On the answer to this question depends the question whether Steropus madidus is to be regarded as an enemy and to be destroyed, or as an auxiliary and to be protected. The assertions that worms are useful to plants by penetrating the soil, loosening it, rendering it permeable to air and water, and even adding to the depth of the soil by bringing their casts to the surface, have been opposed by various practical horticulturists, who assert that soil is not loosened by boring through it, but rather rendered firmer in the parts not bored through; the casts are always water tight, and prevent the current of water, except in impervious loamy subsoils, where, indeed, the presence of these animals is admitted to be beneficial. On the other hand, the direct injuries caused to plants by cutting through the roots, more especially of tender and weak plants, which they always select, and seedlings which, when the points of their tap roots are cut through, have no other resource, and, unless vigorous enough to throw out lateral shoots, must die, evidently turn the balance against the earth-worm, and therefore its natural enemies are to be reckoned amongst the gardeners' friends.

In one of the early volumes of the *Gardeners' Chronicle* (1842, p. 748), a black beetle was figured under the name of the fetid rove beetle (Staphylinus olens), much better known under that of the devil's coach horse, which has the ugly habit when alarmed of throwing up its tail and emitting two white points at the extremity of its body, as well as opening wide a pair of powerful jaws. This beetle was stated to be an enemy to the common earwig, which it would devour in considerable numbers; it, however, is not particular in the kind of insects which falls in its way, but will make a meal of any soft bodied sort which it meets with, and will also, as we have repeatedly seen, attack and devour small earth-worms.

During the past spring the larva of another of our very common beetles has been found to be as great an enemy to the worm as the Staphylinus. For a considerable time a number of worms were daily observed in a small garden in the northern suburbs of London to be lying about the walks dead and dying, having been gnawed during the night time, and after some care in watching for the cause it was discovered that the worms were attacked by the six-legged larva of a coleopterous insect. This larva is represented in the lower part of the accompanying woodcut, its natural size being indicated by the line above the figure; its body is rather fleshy and



depressed, with the head and upper part of the fore segment scaly, sparingly clothed with fine hairs, and three pairs of short-jointed legs attached to the three segments succeeding the head, which is armed with a pair of very sharp sickle-shaped jaws, having an acute tooth on the inside about the middle. The right hand detached outline figure represents one of these jaws, with the corresponding lower jaw and the lower lip with the palpi, whilst the outline figure on the left hand side of the cut represents one of the antennæ, and the eyes on the left side of the head. The hinder extremity of the body is furnished with a fleshy proleg, which assists the animal in walking, above which is a pair of long-jointed slender processes, sparingly clothed with fine bristles. From the form of the jaws, it may be easily conceived what a little chance of escape a worm can possibly have when once it has been seized by one of these voracious larvæ, which seem rather to suck it to death than to gnaw it to pieces, for which its jaws are but ill suited. The transformations of this larva have not been observed, but as Steropus madidus is the only beetle found equally common in the garden alluded to, there is good reason to believe that the larva in question is that of the ground beetle above mentioned.*

Steropus madidus belongs to the family of the ground beetles Carabidæ, and sub-family Harpalides; it measures from half to nearly three quarters of an inch in length, is black and shining, the thorax with a deep channel down the middle and deep impressions within the hinder angles; the elytra are striated, the striæ simple, not punctured, and the legs are entirely black, or with the thighs red. It is very common throughout England and Scotland, occurring under stones and in damp situations, such as cellars and outhouses. *W.*

Home Correspondence.

Cabbages for Cottagers.—In Number 37 of this year, p. 599, it is recommended to cottagers, having cut the first head of a Cabbage, to allow the stem to remain to produce a successional crop of sprouts. Excepting where the rent of land is low and labour dear, I do not conceive this to be a profitable plan, and as cottagers generally pay high rents for their little plots, and have abundance of leisure time, I do not think that the method should be adopted by them. Let any one make the experiment of cutting off in spring the heads of a small plot (say a quarter of a perch, *i. e.*, 2¾ yards square), and on the same day plant an equal portion of ground with good well-rooted plants, and let both crops be frequently hoed. The result will soon show the superior value of the latter for the pot. This is only an example of a general error. Things placed at random have an exaggerated appearance of magnitude, the delusion being at once dispelled by reducing them to order. This irregular summer crop of sprouts moreover appears to be great, because it is seldom cut, there being then abundance of other vegetables. When it is said that 20 or 30 crops (I presume full crops) of Cabbages can be obtained from the same ground in a year, an average of only a fortnight (say a week in summer and a month in winter), is allowed for the sprouts to grow from the state of an eye to a full Cabbage—a manifest absurdity. The profitable course for a cottager (or any one else) to pursue, who wishes to have Cabbages all the year, is to sow three times and plant four, which is fully explained in Sir Joseph Paxton's "Cottager's Calendar of Garden Operations." As soon as a crop is ready for use, the remains of the previous one should be given to cattle or dug in, and the ground cropped with some other vegetables. I will repeat the advice, often given in your columns, never to mould up Cabbages. It prevents the stirring of the soil, so essential for the rapid growth of the plants and the destruction of weeds. *L. S.*

Material for Paper.—I enclose a specimen of fibre, from the leaf-stalk of Horse-radish. Would it not be of use for paper-making? It is readily cleaned similar to the piece sent. The manner in which I separated the fibre from the pulpy matter was by first cutting the leaf-stalks close to the ground, and allowing them to nearly dry, and then removing them to a damp situation. The pulp soon becomes decayed, and, washed in water with the hand, a delicate fibre is left, not unlike Flax, for which, if properly dressed, it might not form a bad substitute. *J. T., Mordon, Surrey.* [The fibre is coarse, but not strong.]

Kiln-drying Potatoes.—Professor Bollman's plan of half roasting the sets was said to entirely eradicate the disease; but this was tried by one of my neighbours without any beneficial results. In thinking on this plan it occurred to me that if any benefit was derived from it, it might be owing to the fact that the spores (or, perhaps, the mycelium) of the fungus, to which the disease is attributed, might be destroyed by a temperature considerably lower than was required to destroy the vegetative power of the Potato itself; this appears to be the case with some fungi, for example. I believe (although I do not grow them) that the proper temperature of an artificial Mushroom bed is somewhere about 60°; but that if the fermentation of the dung, of which it is formed, is so strong as to raise the temperature to 90°, all the spawn is destroyed—there is no crop. Whether this will be found true with regard to the cause of Potato distemper I do not know; but it was the idea on which I acted, and with the following results. My friend having again supplied me in the spring of last year with a few more of his early Potatoes, when dug up, instead of being spread on the garden bed, as before, they were put on the upper floor of an engine-house, where, owing to peculiar circumstances, the temperature was about 90°, and left there a month: the consequence was, that with the exception of two or three that were tainted when they went in, every Potato was quite sound, and continued so until they were planted last spring; and the crop they produced had not one tainted tuber in it. The whole have again been treated in the same manner (they were dug in July) and up to the present time there has not been an unsound one in them. The same plan was also tried with some red Kidney Potatoes peculiarly liable to the disease, both in top and tuber, and with the exception of two or three that appeared to have been diseased before they were exposed to the high temperature, with the same result. These were again planted last spring, and, although the tops were attacked by the distemper, yet, as the tubers were immediately dug and taken into the engine-house, there is not, so far as I know, a failing one among them. Encouraged by these results, I have now tried the plan with some store Potatoes of two varieties of Kemps, and although they were dug up in the wet weather in August, in one of the sorts which were quite ripe only four Potatoes have been found tainted in 120 lbs.; in the other kind the loss has been 4 per cent., 10 lbs. in 240; but other persons who had supplied themselves out of the same lot of Potatoes at the same time lost 60 per cent. of them. This latter kind was not ripe (which is easily seen by the epidermis peeling off with a slight touch), and when they had been exposed to the high temperature for three or four days they began to soften, and though they were removed immediately this softening still remains in some of them, but otherwise they are perfectly good, and seem likely to keep very well; the sort which was quite ripe keeps firm, and the quality is excellent. To all this it may be objected that, even supposing the plan to succeed, there are not many engine houses with a temperature of 90° applicable to the drying of Potatoes. Perhaps not, but there are malt kins, Hop kilns, and Oat kilns (and possibly brick and tile kilns might be made available), in very many localities, where the same plan could be carried out, if it be found to succeed. I do not think I have determined the proper time for keeping the Potatoes exposed to this high temperature, but a month does not destroy their vegetative powers, and three or four days seem sufficient to check the disease; how much less will be sufficient

* So little is known with certainty respecting the transformations of the Coleoptera, that we are not without some doubts whether the larva above described may not be that of one of the large species of rove beetles. The habits of the Steropus are, however, so identical with those of the larva, both occurring, also, in the same situation, that we have deemed it not unlikely that the larva is really that of the Steropus.

I do not yet know, nor do I know how much higher a temperature the Potato will bear with impunity. These remarks are submitted rather to suggest what may be done than to say what is the best mode of doing it; and they are offered with much diffidence, seeing how many attempts have already been made, and how little success has been achieved. *T. G., Clitheroe.* [We have been obliged to defer a portion of this letter, relating to other matters, for want of room.]

Araucaria imbricata on Chalk, and effects of the Winter on other Conifers.—You mention the Araucaria imbricata as bearing exposure to the sea, and say, "A quality of which those who live near the coast, where there is no chalk, will do well to avail themselves of." Has the Araucaria been found not to succeed on a chalk soil? At Boynton, which is near the sea, it is thriving remarkably well, and, I think quite as much so, upon chalk with only a very thin covering of soil as upon deeper sand and loam. I remarked some curious results of the winter there, with respect to situation. Two or three specimens of Pinus Pinsapo had their leading and other young shoots killed, where they were partly shaded by trees, whilst young Cryptomerias planted with them were quite uninjured, the only specimens of Cryptomeria which showed symptoms of having felt the cold being those in the most open and exposed places where the P. Pinsapo was quite untouched by the frost; of P. insignis, one or two were completely killed, whilst others out of the same seed bed, of the same age and size (about four years, and 18 inches high), and planted out in the same place, were almost unhurt. Of the Cypresses at Boynton, C. torulosa appears to have borne the winter best. C. macrocarpa was very much injured, and generally killed. I regret that I was unable to make out a list of the plants injured or otherwise by the winter, at the time when you were collecting information on the subject. *C. W. Strickland.*—— Deodar and Silver Cedar are uninjured. P. insignis planted out, is hardy; but in a bed of 24, from 20 to 24 inches high, 6 or 7 were killed on the 3d of January. P. macrocarpa is uninjured, as is also P. excelsa. P. Montezumæ is hardy. A. Douglasi is hardy; one, planted in 1839, is now 34 feet 6 inches high; some of its lower branches measure 10 feet 3 inches, the circumference of the plant exceeding 52 feet—the magnesian lime rock is within 2 feet of the surface. A. cephalonica is hardy, as is also morinda, Nordmanniana, and Pindrow. Araucaria imbricata and Cryptomeria japonica are hardy. Taxodium sempervirens has had the side shoots browned by frost, but its rapid growth this summer proves it uninjured. Cupressus Goveniana is uninjured, as is also macrocarpa, Cephalotaxus Fortuni, and Libocedrus chilensis. Jezoensis was killed by the frost in 1853. All these plants grow on the magnesian lime, and are at a considerable distance from, and rather elevated above the nearest water. On the 3d January, 1854, the lowest quotation of the thermometer on the banks of the Swale, in this part, was 8°. *W. Lawson, Brough Hall, Catterick, Yorkshire.*—— I see in some of your accounts of Conifers, plants stated to be injured during the past winter which, with us, appear to be perfectly hardy. Permit me, therefore, to furnish you with a few notes from this place. Pinus macrophylla, Grenvillæ, filifolia, Wincesteriana, and Devoniana were killed. P. Russelliana, patula, Teocote, apulcensis, and palustris had their leaves much browned, but they now look nearly as well as ever they did. P. Gerardiana, radiata, halepensis, tuberculata, macrocarpa, Sabiniana, monticola, Lambertiana, excelsa, Fremontiana, muricata, Montezumæ, adunca, cembroides, persica, Ayacahuite, Benthamiana, Lindleyana, and insignis were not injured. We have plants of the latter sort from 2 to 20 feet high, and none of them were hurt. Abies Pinsapo, amabilis, grandis, nobilis, Douglasi, Jezoensis, Nordmanniana, cephalonica, orientalis, and Menziesi have not been injured. A. Brunoniana, a fine plant, has been killed to within 2 feet of the ground. A. Webbiana and morinda escaped injury from the winter, but nearly all their young shoots were killed by the frost of the 24th April. Deodars, also, were quite unhurt by the winter, but some of them had their young shoots killed by the spring frosts. Respecting Araucaria imbricata, some of our plants had a few of their leaves browned, but most of them escaped untouched. Cryptomeria did not suffer in the least. Cupressus macrocarpa, Goveniana, torulosa, and Uhdeana (many specimens) are all uninjured, except a small plant of the last, which had a few of its branches killed. C. thurifera, funebris, Knighti, and sempervirens were a little hurt, but they have quite recovered. Juniperus Bermudiana, macrocarpa, and flaccida were killed. J. oblonga, pendula, recurva, squamata, chinensis, sphærica, thurifera, phœnicea, Gossainthania, fragrans, excelsa, oxycedrus, Bedfordiana, and tetragona were perfectly unhurt. I see that you consider the two last-named tender; tetragona here is one of the most ornamental hardy plants we possess. It is above 6 feet high and as much across, with a beautiful pendant habit. All the Cephalotaxus proved hardy with us. Fitz-Roya patagonica and Saxe-Gothæa conspicua were unhurt. Cunninghamia sinensis was a good deal injured, but it is now growing vigorously. Of four plants of Libocedrus chilensis three were not the least injured, and the fourth had only the points of its shoots killed. Glyptostrobus heterophyllus and pendulus proved quite hardy; so did all the Thujas. I may state that our place is high (about 500 feet above the level of the sea), and considerably above the neighbourhood, consequently we do not suffer so much from a severe winter as from late spring frosts. We have not sustained half the damage last winter that we received in 1853. *M. Henderson, Gardener to Sir G. H. Beaumont, Bart., Cole-Orton Hall, Leicestershire.*

Hardiness of Plants.—You state, at p. 595, that it is "hopeless to grow New Holland Acacias out of doors with any prospect of permanent success." Allow me to say, that I have here an Acacia dealbata, planted in 1835, and now about 22 feet high, in full vigour and beauty, preparing to flower, as usual, in every part. In the winter of 1837-8, it was cut down to the ground by the frost, being then young, but it has not since been injured until last winter, when some branches were so much damaged by the frost that I cut them off. It is now completely recovered, and bears no traces of permanent injury. I may also add, that a Benthamia fragifera is growing near it; and so far from "not thriving," it has flowered abundantly this summer for the first time, and is 10 feet high. My Cunninghamia sinensis is 32 feet high, and though the frost last winter, as usual, browned some of its leaves, the tree has quite recovered itself. My Deodara, about 30 feet high, was in no way injured. It may be interesting to some to know that all the above plants are growing on the northern slope of my garden, well sheltered from the prevailing south-west winds, situated seven miles due north of Lewes, Sussex. The mean temperature of 1853 was 47° here, and the thermometer fell to 16° Fahrenheit on January 2, 1854. My elevation above the sea is about 240 feet. *W. H. Blaauw, Beechland, Uckfield.* ——The plants in the following list proved themselves to be quite hardy last winter. Those marked thus * were against a wall: — *Forsythia viridissima, *Cratægus mexicana, Magnolia grandiflora, and other varieties of the same species (12 in number); Daphne collina, *Clematis graveolens. *Euonymus undulatus, *Myrtus communis flore-pleno, *Camellias, various, Taxodium sempervirens, *Hydrangea quercifolia, *Plumbago Larpentæ, *Garrya elliptica, *Ceanothus azureus, *Ceanothus divaricatus, Gynerium argenteum, or Pampas Grass. *J. Weeks and Co., King's Road, Chelsea.* ——My experience here does not entirely coincide with your statements. Pinus Hartwegi with me is quite hardy. Thuja Doniana not so; it survived the winter, but did not flourish. The Himalayan Bamboo suffered last winter, but did not perish. The only one of the new Berberries that is delicate with me is Fortune's. Quercus glabra (which you do not mention yet) has all but perished. One of the most beautiful of the new shrubs is Ilex dipyrena, and it is perfectly hardy. Would you like to have a complete list of all that I have found to be hardy here? *Henry R. Sandbach, near Llanrwst.* [Yes, if you please.]

Hop Disease.—I am pleased to find that "M. J. B." has been in this neighbourhood inspecting the mould in Hops. I have for the last 10 years used every means to induce the growers to eradicate this pest by the application of sulphur vivum, and not until the last four years have I been successful. The first cultivators who applied the remedy were Mr. Thos. Harryman, of Mereworth, and Mr. Chas. Leney, of Wateringbury, both extensive growers. I have heard Mr. Harryman state that if he had adopted the remedy when it was first suggested, it would have saved him thousands of pounds. I find the grounds or gardens which are most subject to this disease are those situated on the hills of Kentish rag-stone, and in many years it make its appearance on the leaves when the bine is about half or two-thirds up the pole; but it is pretty general when they make the midsummer shoot and are coming into "bur." There is now little doubt that if genuine sulphur vivum be properly and efficiently applied, the grower may bid defiance to this disease; but I regret to say that there is still great prejudice and want of application in remedying this destructive blight. I know of several cultivators who would have grown this year from 15 to 20 cwt. per acre, which would have realised from 18*l.* to 20*l.* per cwt. if this blight of mould had been prevented, but now the crop is worthless. In no case do I consider the sulphur properly applied. No gardener would expect to destroy mould in his Grapes unless the whole of the parts affected were thoroughly dressed with the sulphur; and in the case of Hops it is impossible to do this by the means generally adopted, which consist in throwing the sulphur on by the hand, or with an instrument similar to a flower-dredge stuck upon the top of a pole and shook over the hill. In one instance I have found it applied by a powerful syringe, and this gentleman is the most successful grower in his parish, and his large crop is entirely owing to his destroying the fly or black blight in the first place by syringing the plant with a solution of tobacco water, &c., and then the mould, by mixing the sulphur in water and throwing it on with a large syringe. It is a singular fact that many respectable practical growers still ridicule and laugh at these remedies, although they are at the same time smarting under the blight. There can be no doubt that if growers would adopt the means I have frequently suggested (even our successful Hop grower Dr. Plomley), this disease would be kept in subjection as much as that of Vines and Heaths. The course I suggest is as follows—viz., for every 10 acres employ an intelligent active man; let him be provided with a bag which will hold about 10 lbs. of sulphur strapped round his body (to be filled when necessary), get a machine strong and efficiently made, upon the principle of those invented by me and sold by Barber and Groom, a light step ladder to enable him to ascend to the top of the pole if necessary, let this man be constantly in the garden (from the time of the midsummer shoot being formed till the picking commences) watching every hill of Hops as they advance, and when the least symptoms of mould appear, let the parts be well covered with sulphur; and the power of this machine will throw the sulphur into the most minute parts of the plant or Hops, which will thoroughly arrest the disease, and in most cases prevent its spreading. This may appear an expensive and troublesome remedy; but, compared with the value of the crop, it is trifling, and in some cases will not much, if any, exceed the sum expended in the large quantity of sulphur used and wasted by the ordinary mode of applying it. I have known nearly a ton an acre thrown on the plants, and been of little service, in consequence of the parts most diseased not being touched. The expense for 10 acres I consider to be as follows, viz.:—

Man's wages for 10 weeks, at 16*s.* per week	£	8	0
1 ton sulphur vivum	11	10	0
Machine and ladder	3	0	0
Total	£22	10	0

Average cost, 2*l.* 5*s.* per acre.

If 10 acres be too much for one man to attend to, have two, and the cost will not exceed the value of ½ cwt. of Hops. If the plant be attacked with vermin or black blight, adopt the course mentioned above before applying the sulphur, as it will not do to throw the sulphur on the plant when it is covered with vermin or black blight; but, even in this case, it may be beneficially applied on the "bur" or Hops without touching the leaves. I had nearly forgotten to mention that Grison's mixture has been tried, but with little success. *W. J. Epps, High Street, Maidstone.*

New British Plant.—We have lately received from a lady at Exmouth, specimens of what we take to be the *Lysimachia westphalica* of Weihe, found in the neighbourhood of Dulverton, growing by a brook in a meadow. Although this plant is usually referred to *L. vulgaris* as a variety, it really belongs to *L. punctata*, if we can trust the evidence of specimens in our herbarium, and must bear the latter name. It differs from *L. vulgaris* in having solitary axillary pale yellow flowers, and a corolla fringed with glandular hairs.

Fragrant Chinese Timber.—We have received many boxes from China made of very fragrant wood, resembling deal, and which we have no doubt is the same as that alluded to by "Jael." When Mr. Fortune was in England last, he informed us that it was the timber of Cunninghamia lanceolata. *Standish & Noble.*

Bursting of Trees in Frosty Weather.—I have hitherto accounted for the bursting of large trees under the influence of excessive cold, by attributing it to the expansive force of the sap while undergoing congelation; but this theory seems now to be set aside by Prof. de Vriese's explanation of the fact, according to which we are to suppose that the tree goes on feeding like Jack's giant, till it is obliged to slit itself open for ease, the cold not permitting the trunk to expand. Now, without disputing for a moment that the sap does circulate to some extent during winter, I am really not prepared to charge trees with such monstrous gluttony, especially in cold climates, where the phenomenon usually occurs. In the same countries rocks split as well as trees; are we to apply the same mode of reasoning to them? Again, the professor attributes the destruction of flower-buds by cold to the evaporation of their juices by the wind; but how will this account for their destruction when, as often happens, the sun's heat has raised such a large amount of vapour during the day as at night to cover every flower and twig first with dew and then with hoar frost? Surely in this case there is more than sufficient moisture to counterbalance evaporation. Besides, how can the juices of the plant be dried up when the surface is covered with moisture? I confess it appears to me more in accordance with observation to say, that vegetable life requires a certain amount of heat (varying according to species) to enable it to perform its functions. When our fingers or toes are frost bitten and rot off, we do not attribute it to evaporation, but rather suppose that they have lost the heat requisite for the circulation of the vital fluid, and in consequence have become mere dead matter, subject to the usual processes of decomposition, and the same explanation seems applicable to plants. I admit that this does not throw much light upon the actual mode in which cold operates upon plants; but it is probable that among its destructive effects the rupture of the sap vessels may hold a prominent place. Not having microscopically examined the tissues of frozen plants, I merely suggest the idea in the hope that some of your readers may be able, from personal observation, to confirm or negative the supposition. *R. E. E.*

Thorn Hedges.—Having read Mr. Bailey's valuable articles on Woods and Plantations, permit me to inquire if I understand him to say that autumn is the best season for cutting over old Thorn hedges? And if he or any other of your correspondents would give me their experience of transplanting old Beech and Thorn hedges, with their system and success, they would greatly oblige *A Hedger.*

Societies.

ENTOMOLOGICAL, *September* 4.—The President in the chair. Donations to the library and museum were announced from the Royal Academy of Berlin, the Royal Societies of Spain, London, and Van Diemen's Land, the Society of Arts, and various Continental and native correspondents. The President communicated a letter received from Professor Edward Solly, F.R.S., who is engaged in organising the Museum of Manu-

factures for the Society of Arts, requesting the contribution of specimens of beneficial or obnoxious insects from the members. Specimens of a very beautiful Noctua, new to this country, captured in North Wales by Mr. Evans, of Darley Abbey, were exhibited by Mr. S. Stevens, as well as specimens of Agrotis valligera and other rare species from Freshwater, Isle of Wight, and a box of Coleoptera just received from Mr. Wallace, who has undertaken a Natural History Voyage to the Islands of the Eastern Archipelago. The present collection was the first fruits of his expedition, and contained a great number of new and remarkable species from Singapore. Mr. F. Bond exhibited Orthosia hyperborea from Perthshire, Rusina tenebrosa from the New Forest, and various rare moths from the Isle of Wight. Another box of insects, of various orders, captured by Mr. Foxcroft, at Rannock, Perthshire, intended for distribution among his subscribers, was also exhibited, as well as a box of interesting Coleoptera from the New Forest, exhibited by Mr. Edward Shepherd. Mr. Hudson exhibited an interesting specimen of the common blue butterfly Polyommatus Alexis, the wings on the right hand side of the body being female and those on the left side male. Mr. Edwin Shepherd stated that he possessed a specimen in which the wings exhibited an opposite arrangement. Mr. F. Smith exhibited specimens of rare and new Hymenoptera, recently captured near Southend, including Myrmica cæspitum in all its states, and various species of Bombus, the specimens of the different states having been taken from the nests. Mr. Oxley exhibited several boxes of insects of different orders from the neighbourhood of the gold diggings in Australia. Mr. Curtis presented specimens of the male of the remarkable insect figured by him under the name of Acentropus Garnonsii, and exhibited the female and a mass of eggs from the collection of Mr. Dale. Mr. Westwood stated that he had been informed by a correspondent that the white Mustard crops near Ely were at present infected by Phædon Betulæ in myriads which gnawed the rind off the stems and seed-pods. He also exhibited drawings of a species of Acarus which had been found in great masses at the foot of a recently made hay-rick; and also specimens of a species of Chelifer which he had received from a correspondent, by whom it had been found in considerable numbers upon Melons. Messrs. Curtis and Walker, however, considered that its object in seeking such a situation was to feed upon the other insects which were attacking the plant, and that it was not itself injurious to the Melons. Mr. Walkeys communicated an observation in which the common wasp had been seen gnawing off the outside of dried stalks of stinging Nettles; and Mr. F. Smith stated that he had had a nest of Vespa rufa for two or three months, the specimens of which were very fond of gnawing the outside of his deal store boxes, to obtain material for their nests. It thus appears evident that it is not always of fungoid matter, as recently has been asserted, that the covering of wasps' nests is made. Mr. G. F. Wilson communicated some seeds of Copernicia cerifera, which yields the carnahuba wax which had been devoured by the larvæ of Caryoborus Bactris, a large species of Bruchidæ.

Notices of Books.

Phillips' Guide to the Crystal Palace has reached a new edition, in which we discover many improvements, that the haste with which the first edition was prepared rendered desirable. Among other things is an excellent ground plan of the garden, as it is to be, corresponding with the description given of it in this journal, at p. 739, 1853. This was very much wanted, the unfinished state of the ground rendering the ultimate plan incomprehensible to the uninitiated.

With regard to the plants in the interior of the palace, concerning which we have hitherto been silent, we have now to state that when we last saw them they gave great promise of a fine effect, and that they were all in a satisfactory state of health. The noble Orange trees, and far more noble Pomegranates, from Neuilly, were most especially deserving of notice. But we have no intention of examining this branch of the great work until after the succeeding winter. In the meanwhile the reader must rest satisfied with Mr. Phillips' description, which we quote entire:—

"And first let us speak of those trees and plants which are common to the whole length of this splendid avenue—the Orange and Pomegranate trees—of which there are altogether 110, forming a bright perspective of converging green, giving additional effect to the long vista of the nave. These trees, some of which are 400 years old, were originally selected from the different palaces of the Orleans family by Louis Phillipe, in order to decorate Neuilly, his favourite residence. When the property of the Orleans family was sold by public auction, this fine collection was purchased by Sir Joseph Paxton for the Crystal Palace Company, much to the regret of his Majesty, the Emperor of the French, who greatly desired to preserve the beautiful and matchless natural productions for his country. Suspended above the lower galleries, the visitor will notice long lines of baskets filled with flowers. From these ornamental and floating vases, of which there are upwards of 300 in the Palace, fall trailing plants. Around and across the columns creepers are planted, which in course of time will clamber over every part of the building and line with grateful shade the great arches of nave and transept. Among these creepers will be found the Bignonia, Wistaria, and Tacsonia.

"The south end of the palace and the south transept contain a selection of plants, consisting chiefly of Rhododendrons, Camellias, Azaleas, and other choice conservatory plants, most carefully selected; in the south transept, especially, are arranged the finest specimens of these plants that can be seen. Opposite the Pompeian Court are placed two fine specimens of Aloes, and, conspicuous opposite the Birmingham Industrial Court, are two Norfolk Island Pines. Opposite the Stationery Court are two specimens of Moreton Bay Pine, as well as several specimens of Telopea speciosissima from Australia. Under the first transept may be noticed two remarkably fine Norfolk Island Pines, presented by his Grace the Duke of Devonshire.

"The garden facing the Egyptian Court is principally filled with Palms; and on either side of its entrance are two curious plants (resembling blocks of wood) called 'Elephant's Foot;' they are the largest specimens ever brought to Europe, and were imported from the Cape of Good Hope by the Crystal Palace Company. This plant is one of the longest-lived of any vegetable product, the two specimens before the visitor being supposed to be 3000 years old. Before this court will be noticed also two fine Indian-rubber plants—a plant that has latterly acquired considerable interest and value, on account of the variety and importance of the uses to which its sap is applied. Here will also be noticed an old conservatory favourite, though now not often met with, the Sparmannia africana. Amongst the Palms will be remarked many of very elegant and beautiful foliage, including the Seaforthi elegans, one of the most handsome plants of New Holland, and the Chamædorea elegans of Mexico. On the left of the entrance to the Egyptian Court will be seen perhaps the largest specimen in Europe of the Rhipidodendron plicatile from the Cape of Good Hope. Opposite the central entrance to the Greek Court, and in front of the beds, are two variegated American Aloes. The beds are filled with a variety of conservatory plants, and have a border of Olive plants. In front of the Roman court will be observed, first, on either side of the second opening, two large Norfolk Island Pines, presented by her most gracious Majesty and his Royal Highness Prince Albert. The beds, like those before the Greek Court, are principally filled with Camellias and Rhododendrons, and are also bordered by several small specimens of the Olive plant. Between the two foremost statues, at the angles of the pathway leading to the second opening, are placed two specimens of the very rare and small plant, which produces the winter bark of commerce, and which is called Drymus Winteri. The garden in front of the Alhambra is devoted to fine specimens of the Pomegranate. Having passed the Alhambra, we find the garden of the whole of this end of the building devoted to tropical plants, including a most magnificent collection of different varieties of Palms.

"Between the sphinxes are placed 16 Egyptian Date Palms (Phœnix dactylifera), recently imported from Egypt, and which owe their present unflourishing appearance to the delay that took place in their transmission, on account of the steamer in which they were conveyed having been engaged, on her homeward passage, for the transport of troops. Amongst the different varieties of Palms, the following may be noted, either for their large growth or beautiful foliage: an immense specimen of the Sabal palmetta from Florida, and a fine Sabal Blackburniana; also several fine specimens of the Cocos, amongst which is the Cocos plumosa, reaching the height of 35 feet; numerous specimens of the Wax Palm (Ceroxylon andricola), natives of Columbia, and the curious Calamus maximus, which, in the damp forests of Java, grows along the ground to an immense length, and forms with its sharp prickles an almost impenetrable underwood, are also here. Sagueras saccharifera of India, noted for its saccharine properties, and the vegetable Ivory Palm (Phytelephas macrocarpa), deserve attention. The specimen of Pandanus odoratissimus, from Tahiti, is also remarkable, on account of its sweet smell.

"Opposite the Byzantine Court, the garden is filled with different varieties of Palms brought from South America, Australia, and the Isle of Bourbon. Before the Mediæval Court may be noticed two Norfolk Island Pines, and close to the monuments at the entrance of the English Mediæval Court, are two Funeral Cypresses, brought from the Vale of Tombs, in North China. Close to the Norfolk Island Pine, on the right, facing the court, is a small specimen of the graceful and beautiful Moreton Bay Pine. The garden in front of the Renaissance Court is filled with conservatory plants, consisting of Camellias, Azaleas, &c. On either side of the entrance to the Italian Court are two very fine American Aloes, the beds here being filled with Olives, and other greenhouse plants. In the garden, in front of the Foreign Industrial Court, will be noticed two fine Norfolk Island Pines."

New Plants.

87. Thujopsis dolabrata, *Zuccarini in Siebold's "Flora Japonica," vol. II., p. 34, figs. 119 and 120.*

This noble evergreen Coniferous tree from Japan, which it has for so many years been in vain attempted to procure, has at last been secured in the Botanic Garden, Leyden, as we learn from Prof. de Vriese. It has the flattened branches of a Thuja, but its scales are broad, and dark green on the upper side of the branches, but glaucous on the under side, thus producing a singular mixture of colour. Siebold's account of it is as follows:—"The Hiba is a very lofty tree, with a majestic aspect. Its head is pyramidal, and formed by open or even pendulous branches. It is found in the mountains of Nipon, especially in the Hakone chain, where it prefers the damp slopes of valleys. Its wood is much sought after for building purposes." It is also one of the trees used by the Japanese for dwarfing. We presume it will prove quite hardy.

88. Eugenia oleoides, *Pl. and Linden.* (Myrtus filifolia, *Lind. Cat.*)

"A graceful Myrtaceous plant, with elegant drooping branches, nearly filiform leaves, and numerous white flowers proceeding in axillary panicles from the leafy ends of the branches. The plant is a universal favourite. It requires to be kept in a greenhouse." Marked in the catalogue of Mr. Linden at 25 fr.

Garden Memoranda.

Swiss Cottage, Cheshunt, the Residence of H. Bellenden Ker, Esq.—It may perhaps interest some of our readers to know that, notwithstanding the unusual severity of last spring, this autumn's experience of a Peach trellis, put up here some years ago by Mr. Ker, has been quite as satisfactory as that of former seasons. The contrivance merely consists of a rough trellis covered with glass sashes some 10 feet in length, resting on posts 4 feet high at the back, and on 1½ foot supports in front. The back part is quite open; but the ends are closed with deal boards, and an 11-inch plank is also nailed along the front; but so as to admit plenty of air. From this trellis, which is about 16 yards long, and contains four trees, Mr. Ker has had a crop of between 40 and 50 dozen first-rate well ripened Peaches, which for colour, size, flavour, and juiciness have certainly surpassed those on walls. The success of the plan this year, unfavourable though the spring is well known to have been, is perfect, and therefore the advantages arising from contrivances of this description, where wall and house accommodation is limited, must be obvious; and it will be seen that they are so simple in their construction that a handy labourer might erect one with the greatest facility. No mildew, we understand, has attacked the trees on this trellis, and although red spider began to make its appearance during the late hot weather, it was soon checked. The lights have recently been removed from the trellis, which with its trees is now exposed to the open air. The latter have made good wood for next year, in which a full crop may again with confidence be expected from them. We should add that we believe the gardener (Mr. Woolley) covers the lights of this frame with hay during such nights in spring as are very cold or frosty.

A new house 56 feet in length and 20 feet in width is now being built here for Peaches; those on the trellis just mentioned, and on walls, though plentiful on both, coming in at a time when the family is from home. It is to be what is called half-span roofed, and heated with hot water in 4-inch pipes. It is also intended to be furnished with large trees, in order that as little time as possible may be lost in waiting for them to fruit.

The quarters of the kitchen garden are bordered with dwarf pyramidal root-pruned Pear trees, which are this year, as usual, literally loaded with large and fine fruit, while in an orchard on the same kind of ground, and about equally exposed, but on a lower level, scarcely a fruit can be found, although the trees were quite as well furnished with blossoms in spring as those on the higher ground. In neither case was artificial protection afforded; the failure in the low ground must therefore be attributed to the severe frost we experienced on the night of the 24th of April taking more effect there than on the higher level. To the small trees round the borders of the kitchen garden just spoken of, therefore, the greatest interest attaches, not only on account of the heavy crops with which they are furnished, but also on account of the different fruits being so near the eye that they can all be closely examined with the greatest ease from the walks, and their peculiarities, if any, noted day by day as they grow and ripen. These trees receive very little winter pruning, that being, for the most part, performed in autumn, as early as it is seen that growth has terminated. The trees are, therefore, not encumbered with wood, which must be removed at a later period, and what is left has a better chance of ripening. Apples here, where they are sufficiently out of the valley to have escaped the spring frost, are also a heavy crop, more especially on trees of Lemon and Fearn's Pippin, which are quite loaded with fruit. Many other good sorts are also equally productive.

The glass houses here, though of the most inexpensive kind, answer the purposes for which they are intended uncommonly well. A Vinery, on the principle of Mr. Rivers' orchard-houses, has a fair crop of Grapes in it, which are netted to keep wasps from them. Excellent wood has been made for another year, some of the rods being quite 10 feet in length, as thick as the thumb, and brown and hard. A brick Arnott stove offers the only means of warming this house; but we understood Mr. Woolley to say, that even this is seldom if ever used. On the north side of this Vinery are two span-roofed Orchid houses, one heated by a tank, the other by 4-inch hot-water pipes, all from one boiler. The walls of the latter house, as well as those of the Vinery just mentioned, consist of deal boards covered on the outside with tarred felt, and, as has already been stated, they answer every purpose to which they are applied admirably. The Orchids, which have been so successful in obtaining prizes at the great London shows this year,

are in the best of health, and some of them, as the beautiful Harrison Cattleya, are even now in full bloom. The Cœlogynes maculata and Wallichi, also promise to flower charmingly in a month or six weeks' time, their pseudo-bulbs being unusually strong, and well furnished with bloom buds. Few of the smaller growing Orchids are so useful or handsome as these favourite late-flowering plants.

Out of doors the grounds are everywhere in good order, and as full of flower as could well be desired. The bedding plants, though perhaps now a trifle past their best, are still very beautiful; and the vases filled with Pelargoniums on the terrace round the house have been and are still very striking. In one is a variegated kind called Lady Plymouth, the leaves of which are beautifully scented. On the lawn a fine specimen of the Pampas Grass has wintered safely, and is now throwing up flower stems. It appears to succeed here perfectly, growing and blossoming every year satisfactorily.

FLORICULTURE.

CULTURE OF THE POLYANTHUS.—Some prefer growing this plant in pits, a system I never adopt; as they require much greater attention, are far more delicate in habit, and never increase so well under this mode of treatment. Others separate and replant in the beginning of August, and too frequently lose a great many plants by so doing, which, in my opinion, is one reason why Polyanthuses are so scarce; but they quietly content themselves that some few are spared, and directly attribute the loss to hot weather, which is a mistake; for at this season the plants are almost, I may say, in a dormant state; in fact the old foliage is fading, the new is not advanced, and if removed, however suitable the weather, a great many will most assuredly die. The situation most suitable for them is a well raised border on the north side of a Quick or Hawthorn fence; this serves as a shade during the hot months of summer, and also allows sufficient sun to reach the plants in spring. About this time (middle of September) or as soon as the new foliage is advanced 2 or 3 inches (not before), take up your plants, separate the increase, and plant them in the border, prepared of loamy turf, leaf-soil, and rotten sheep dung. Give them sufficient water to settle the soil at the roots, and should the weather prove dry, repeat the watering accordingly. The plants may then be left without any further care. I never give mine any protection whatever through the winter, and although the season may be severe, I do not lost a single plant. In the first week in April I select such as have made the best trusses, for exhibition, and taking them from the border, with as much soil as possible, I place them in 6-inch pots, give a gentle watering, and remove them to a more shady situation. I guard against snails by scattering a little Barley chaff or common salt about the pots, or they would destroy the blooms, and my labour would be in vain. The careful removing of the plants rather improves the quality of the flowers than otherwise; but as soon as the day of exhibition is over, I replace them in the border, in their former situation. During the months of May, June, July, and August, a few branches stuck on the border will be of great service, and effectually prevent the sun from scorching the plants, which would injure them to a serious extent. Plenty of water must be supplied daily; should the weather prove dry and hot, regularly soak them, or they will probably be attacked by red spider, which undoubtedly destroys numbers of plants every season. Should you be troubled with this pest, syringe the foliage without delay on the under side with some strong soapsuds. This will drive it away, if not destroy it, and there is no fear of being troubled a second time, as it will never return to the plants any more that season. I have always found one application effectual, and the plants have not suffered in the slightest degree. By the above treatment I have always had a fine bloom. *S.*

SEEDLINGS.

CARNATION: *Q.* A useful variety for ordinary purposes.
DAHLIA: *T A.* Good in colour and petal; centre faulty.
FUCHSIAS: *S & N, Liverpool.* All good, but not better than kinds we have already.
HOLLYHOCKS: *J B.* All more or less "pockety," and otherwise inferior to kinds possessing the same colours already in cultivation. The best is the one named Essex Champion.
PETUNIAS: *S & H.* A good bloom of a sort now not uncommon.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—All tender-rooted plants should be got under cover at once, if not already done; for these cannot with any measure of safety be exposed to drenching rains at this season of the year. If it should be inconvenient to house the whole stock at present, select for remaining out such things as require a plentiful supply of water at the root, and are under rather than over-potted. For instance, many of the stronger sorts of Azaleas, Acacias, Camellias, Cytisus, &c., if not over-potted, will not be easily injured by wet, and will bear a slight frost with impunity. But useful specimens of even hardy things should not be exposed to heavy falls of rain. If the gaiety of the conservatory is dependent to any extent upon plants brought from the stove, these will require some care, in the event of wet cloudy weather continuing, to prevent their being injured by damp. Give air freely on every favourable occasion, and if this is found to be insufficient use slight fires at once; for flowering plants are not generally so plentiful at this season as at some others, and hence any care that will tend to preserve their beauty will be well bestowed. Keep everything in this house as clean and neat as possible, and take advantage of unfavourable weather for out-door work, to thoroughly clean the glass and paint, &c. Also go over the twiners frequently, and cut back those that have done flowering, in order to admit light freely. Examine specimens in pots, particularly such as are not in the fittest places for them, which is often the case with plants brought into the conservatory while in bloom, and turn them once a week, so as to expose all their parts equall to light and air.

FORCING DEPARTMENT.

PINERY.—Plants on which the fruit is approaching maturity must not be over-watered at the root, and moderate fires should be used on dull days, to allow of giving air to prevent a damp stagnant atmosphere, which would be most injurious to the quality of the fruit. Fruit in less advanced stages, however, will enjoy a damp atmosphere, and these may be syringed early in the afternoon, shutting up early on fine days, with a high moist temperature. Give these moderate supplies of manure-water at the root, but avoid getting the soil too wet, and endeavour to afford them a steady bottom-heat of about 85°. Young plants, especially those growing in dung pits, must not be kept over close and warm in dull cloudy weather, as this would tend to induce weakly growth, therefore admit air freely on fine days, and, if necessary to keep the plants stocky, leave a little at night. Young stock in pits properly heated by means of hot-water pipes may, however, with careful attention, be grown on freely for some time longer yet, without the least danger of inducing weakly growth; but to effect this the temperature must be regulated according to the amount of light, and every care must be observed to secure a vigorous root action, without which healthy vigorous growth is impossible.

VINERIES.—Use slight fires, with a gentle circulation of air, when the weather is damp in houses where ripe fruit is hanging, and endeavour to keep the atmosphere dry and cool, in order to preserve the fruit against damp, &c.,; also look over the bunches once or twice a week, or oftener, as may be necessary, and remove any tainted berries immediately they can be perceived; for these, if left in the bunches, communicate the malady to others. It is a too common practice to expose the Vines to the weather directly the fruit is cut; and some persons deem this practice essential to the ripening of the wood. Such treatment may answer very well when the weather happens to be warm and dry, and the foliage not so tender as to be injured by exposure; but to expose Vines in damp cloudy weather, when the object is to ripen the wood, is merely preparing for disappointment in next year's crop: therefore, where the wood is not thoroughly ripe, keep the atmosphere as dry and warm as can conveniently be done, and maintain a constant circulation of air night and day. Keep the foliage clear of insects, particularly black thrips, which are often very troublesome at this season, especially where plants are grown under the Vines. In houses where the fruit is not yet ripe, use brisk fires with plenty of air, and endeavour to get the fruit properly ripened as speedily as possible.

FLOWER GARDEN AND SHRUBBERIES.

The most important matter in this department at present is the propagation of a sufficient stock for wintering of everything likely to be wanted at next planting out season. If previous directions have been attended to, however, this work will by this time be in an advanced state. But where cuttings are still to be put in, not an hour should be lost; and of Verbenas, &c., at least twice the quantity which it may be desired to have in spring should be put in; for besides the probability of losing a considerable proportion in winter, they will be weakly, and will not afford so many cuttings in spring as those that were put in earlier. Those which are established in their winter pots should be freely exposed to air, but they will not be benefited by exposure to long-continued drenching rains, and, where it can be done, they should be kept under glass, or placed where some covering can be used to throw off heavy rains. Secure as many cuttings as possible of the scarcer sorts of variegated Geraniums before they are injured by frost, for it is not easy to have too many of these beautiful plants. Cut off the decayed flower-stems of herbaceous plants, and keep those in beauty secured against the ill effects of high winds. Also keep the beds trim and orderly, and avoid as much as possible allowing it to be seen that the knife has been used, but keep them within proper limits. Queen and Brompton Stocks may still be planted in their flowering situations, choosing showery days for the operation. If any of the beds which are to be planted with Dutch bulbs after the frost destroys their present occupants require a dressing of fresh soil, this should be mixed in readiness, for the sooner the bulbs can be planted after this time the more likely will they be to bloom freely.

FLORISTS' FLOWERS.

Prepare beds in which to plant Hollyhocks for next year's bloom; procure strong plants in pots, and put out at intervals of four or five feet. Gather seed as soon as ripe. It is advisable as much as possible to keep the seed separate when intended for the amateur's own growing. There is a better chance of comparing the relative merits of seedlings when growing together. Continue to pot off Carnation and Picotee layers, choosing dry mild weather for the operation; when potted, place in a cold frame for a few days, till they have again taken root, when they may be gradually inured to the full air. PINKS and PANSIES should be planted out forthwith; pot a few of each as a reserve to fill up vacancies in the spring.

HARDY FRUIT AND KITCHEN GARDEN.

Give careful attention to the preservation of fruit from wasps, which seem to be more than usually numerous this season. Late Peaches, Plums, &c., must be closely netted up, and Pears, &c., must be frequently examined, gathering them as soon as they are fit, for if any of these are allowed to hang after they are ripe, and the wasps once find them, the probability is that unless they can be covered with a net, the finest fruit will be spoiled. Where Currants are covered with mats they should be opened occasionally after wet weather, choosing a fine forenoon, so as to expose them to a free circulation of dry air. Trim and dress Strawberry beds, but be careful to injure the leaves of the plants as little as possible, and avoid deep digging between the plants, which is of no use except to injure the roots, for the Strawberry rather prefers a somewhat firm soil. Make a last sowing of Lettuce on a dry warm border, which, as they will be dwarf and stocky, will stand the winter better than those that were sown earlier. Get the August sown planted out on a sheltered warm border, also transplant Cauliflowers where they are to be wintered under hand-glasses, but do not use these until the weather becomes severe. Clear off exhausted crops, and keep down weeds, and maintain neatness, &c. Also get manure wheeled on vacant ground, and proceed with digging and trenching as opportunity offers.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Sept. 21, 1854, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 25th, 1832—therm. 82 deg.; and the lowest on the 27th, 1828—therm. 24 deg.

Notices to Correspondents.

BOOKS: *Earn.* Moore's "British Ferns" (Groombridge, 2d edit.), is, we suppose, the book you are in search of.—*Tuamensis.* Kemp, "How to Lay Out a Small Garden." Bradbury & Evans.—*L Y Z.* Lindley's "Theory of Horticulture," the forthcoming edition, if you want applied Physiology.

CALATHEA ZEBRINA: *H S.* This common plant blossoms every year abundantly when in the hands of a cultivator of any sort of skill.

CLIANTHUS PUNICEUS: *J Sm.* We fear your plant will hardly ripen its wood enough to bear the winter at Ambleside. All you can do is to mat it well up, and remove in the spring what may have died during the winter.

NAMES OF FRUITS: *A Subscriber.* The Plum, which you believe to be a seedling, is not known.—Received—*Iscoed; a Constant Subscriber.*

NAMES OF PLANTS: We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J YJ.* 1, Pterospermum acerifolium; 2, Jatropha multifida.—*E J P.* Cochlearia anglica, or Scurvy-grass.—*Erzeroum.* 779, Campanula alliariæfolia (?), specimen bad; 11, Fritillaria tulipifolia: 565, Allium Schœnoprasum; 365, A. rubellum; 534, A. flavum; 1, Bulbocodium vernum (?); 223, Ornithogalum umbellatum; 1055, Asparagus amarus.—*Z Z.* Vallota purpurea.—*M P.* Euphorbia Lathyris.—*A Subscriber, Ilay.* Saponaria orientalis, a very pretty annual, by no means common.—*W. Glover.* Amaranthus tricolor, an old-fashioned tender annual.

PORTABLE CIRCULAR SAW: *Breakneckdean* will be obliged by any of our correspondents instructing him of the existence of a portable circular saw, with a flywheel, that can be easily conveyed from one spot to another in woodlands of a broken and rough character, by means of which thinnings, &c., may be reduced to a portable size. And if so, he would consider it a great additional kindness were he told where he could procure it.

TENANT RIGHT: *J M.* We apprehend you have a right to remove the trees, provided you state your case fully and fairly. But all will depend upon whether you can show yourself to be a nurseryman, and that the trees have been planted as part of your stock, merely for the purpose of being resold. Your having occasionally sold one or two will not justify your removing the remainder. This, however, is a matter on which, if you are wise, you will consult a solicitor and not a newspaper.

THE HERBARIUM: *A Young Botanist.* Let the spirit dissolve as much of the corrosive sublimate as it will. Then weaken the solution by adding to it an equal quantity of mere spirit. This for ordinary purposes. For the heads of Composite plants and succulent specimens, use the first solution without diluting it.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only: and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6*l.* per ton, free to Railway.
They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.
Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.

THE PATENT ALKALI COMPANY manufacture on a large scale, at their extensive works in Lancashire, Sulphate of Copper (Blue Vitriol), Soda Ash, and Crystal Soda of first-rate quality, which may be fully depended on for purity. The Company's Purple Brown Metallic Paint is also held in high repute as a pigment for Iron, Roman Cement, &c. &c. Orders, &c., to be addressed to Mr. JOHN A. WEST, Secretary of the Company, 1, New Broad Street, London.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.
It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

Extracts from numerous Testimonials in favour of JACKSON'S PREPARATION.

"Belmont Farm, Eltham, Kent, August 28th, 1854.
"Sir,—I am now about to perform my promise, to let you know how your prepared Potatoes have turned out here. As a practical farmer of some experience I had despaired of finding any remedy for the disease; but I must confess that a stronger proof of the efficacy of your process in Preserving Potatoes, could not have presented itself than I have now to relate. One of the fields of this farm, the property of Mrs. Stanbury, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the smut. Any person may see the difference of the prepared and unprepared Potatoes at a glance. You are at liberty to make any use you please of this letter, and I remain, Sir, your obedient Servant,
"G. B. BAXTER.
"To Mr. Jackson, "Late of Ruxley Farm, Kent.
"18, Cannon Street, London Bridge."

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY's Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Students are admitted after the summer and winter vacations, also in April and October. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

GLOUCESTERSHIRE AGRICULTURAL ASSOCIATION.—21st ANNUAL MEETING, at GLOUCESTER.
EXHIBITION OF STOCK, &c., THURSDAY, November 23. The Premiums, amounting to 174*l.*, open to all Subscribers of 1*l.* or upwards.
POULTRY EXHIBITION, WEDNESDAY and THURSDAY, November 22 and 23. The Prizes, amounting to 97*l.*, open to general competition. Entrance Fees, 3*s.* per Pen for Bantam Classes, and 5*s.* per Pen for all other Classes.
Entries for Stock and Poultry close October 20. Prize Lists and Forms of Certificate may be had on application to
A. G. JONES, Secretary, Gloucester.

SMITHFIELD CLUB, 1854.
CHRISTMAS FAT CATTLE SHOW.—The Annual Show of Fat Cattle, Sheep, and Pigs, will take place on the 5th, 6th, 7th, and 8th of December, 1854, at the Carriage Bazaar, King Street, Portman Square, London.
All Certificates must be returned to the Honorary Secretary on or before Saturday, the 4th NOVEMBER, 1854.
Prize Sheets, and the necessary Printed Forms of Certificates, are now ready, and can be obtained on application to
B. T. BRANDRETH GIBBS, Hon. Sec.
Corner of Half-Moon Street, Piccadilly, London.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 23, 1854.

MEETINGS FOR THE ENSUING WEEK.
THURSDAY, Sept. 28—Agricultural Imp. Society of Ireland.

NOWHERE, perhaps, is the old proverb "A bad hand never gets a good tool," more applicable than in the harvest field; for let it be sickle, "bagging hook," or scythe, its effective operation becomes very different in the hands of workmen of unequal skill, and, we presume, the reaping machine will not be found an exception to the proverb.

This being the case, various questions naturally arise as to how far the comparative value of machines can be judged from the quality of the work performed; for if this furnished little or no evidence in the case of the sickle and scythe, what dependence can be placed upon it in that of the reaping machine? To determine, for instance, which of two is the best scythe, the judge has to try them himself. Are we approaching a similar practice in the case of reaping machines? Or can their value be determined by observation only, owing to their greater abridgment and condensation of labour?

The more labour is abridged by any machine the less, as a matter of course, will the several details of it be under its control. Machines, for instance, which gather the corn into swathes, as BELL's, or into sheaves, as is aimed at by the automaton, will be less dependent upon the quality of manual labour in this department than the American reapers, which require a man and rake to perform the work; for in the latter case such a workman may be a good or bad hand. He may after a very short term of apprenticeship become an expert workman, making good work, or he may be the very reverse, never being able to gather successfully. In the hands of the one, the machine, under such circumstances, would be a good one, but in those of the other a bad, just as has been experienced in the case of the sickle and scythe.

Analogous, again, to mowing with the scythe or reaping with the sickle or hook, the successful cutting of a reaping-machine must necessarily depend upon the proper direction and manner in which it is driven; and this, as in the former case, will very much depend upon the peculiar state of the crop and atmosphere.

With the scythe, for example, a calm day and a standing crop are not considered a favourable state of things; for, under these, a mower will mow from one-third to one-fourth less than with a fair wind—and when laid in different directions, not more than one-half. With a good breeze on his back, or rather some degrees to his right (the direction which the most successful generally choose), he may cut down 2 acres per day of standing corn; if calm, 1½ acre; and if laid, not more than 1 acre. We have seen the scythe, when introduced into a northern province, condemned because it would not cut standing corn on a calm day, and laid corn in any direction the wind blew! and yet subsequently entirely supersede the sickle.

With the reaping machine, a comparatively calm day and a standing crop would obviously be the most favourable state of things, because it cuts going and returning; whereas, the scythe only cuts in one direction, the mower returning empty. Returning empty is a great waste of time, which cannot be avoided in the case of the scythe or hook, for no mower or reaper would attempt cutting against the lie or inclination of the corn. In learning to work reaping machines successfully, a practical question may arise as to the propriety of making a similar sacrifice with them on a very windy day, even in the case of standing corn.

What may be the ratio of speed or areas of cut corn under different circumstances of this kind with reaping machines—whether 100, 75, and 50, as in the case of the scythe—is a question which must be left for experience to answer; but there cannot be a doubt that some such differences will ultimately be realised, for it would be unreasonable to suppose the contrary. If a mower, for instance, expends three times the amount of labour or power in cutting an acre of lying corn, which he does on one of standing, can we suppose that the same amount of horse-power will perform the work in the former case, when that power is less favourably applied? It would require six horses at least instead of two to get over the ground in equal times under such circumstances, an increase not generally calculated upon, we fear, in trials of cutting the partially laid corn, which can be attempted with machinery.

In the harvest field such an increase of power is impracticable, and therefore the other alternative must be adopted. Like the successful mower, we must learn to wheel about machines so as to cut the corn in the most favourable direction.

We may add here, in connection with this subject, that at the trial of reaping machines at Stirling last week, the Highland Society's prize of 20*l.* was awarded to CROSSKILL for BELL's reaper; the Stirling prize of 20*l.* was also awarded to CROSSKILL for the same machine; and the prize of 20*l.* given by the Stirling Agricultural Association for machines under 25 guineas in price was awarded to DRAY & Co.'s patented modification of HUSSEY's reaper. We learn from the *North British Agriculturist* that by the arrangement of the committee of management, each machine had to operate upon the different crops in the following order:—Oats, Wheat, Barley, and Beans; and for each machine a portion of the respective crops was marked off, for which the owners drew lots, and to these lots the respective numbers were affixed. The five lots of each crop were, of course, in the same field, and it fortunately happened that the crop in each was tolerably uniform in quality. The Oat field was a fair stand-up sample; the Wheat rather thin on the ground, and consequently upright, with a strong undergrowth of creeping weeds; the Barley, without being laid, was considerably distorted and trying for a machine; the Beans were on the whole a strong crop, but less uniform than any of the others; and as for the surface state of all the fields, it was that of land under the best system of modern management, hence in the most favourable state for machine reaping. The work done was considered satisfactory.

IN reference to the heavy cost of harvest work at Cirencester, to which we alluded last week, we have received the following explanation. The point particularly named was the cost of binding, or rather of attendance generally on the machine—MCCORMICK's reaper—used. On this it is said—

"Two of the men are always with the machine, and two more raking after it, leaving 10 to gather, bind, and stook. The work of these 10 is considerably harder than it would be after hand-reaping, as the corn is delivered in inconvenient bundles, which require some manœuvring and handling to tie them up into a shapely sheaf. It will therefore always take more time and labour to tie and stook an acre of corn cut by the reaper than when cut by the sickle. Add to this the ridiculous repugnance felt by our rustic labourers to any new implement, which prevents them doing their best, and you will have a sort of explanation of the seeming extravagance of the cost per acre. Perhaps there is no agricultural operation which so requires all hands to work with a will together, as the one in question. And this *will* is so subtle, and so unreachable by ordinary authority, that no care in supervision can make up for the want of it."

The cost of reaping, tying, and stooking, amounted

on the whole to 7*s.* 7*d.* per acre. It may be well to contrast this with a report we have just received from a correspondent, "E. T. B.," near Stranraer, who thus states his experience of the expense of mowing, binding, and stooking, calculated from work performed on his farm in a field of 28 Scotch acres:

Sept. 5,	Nine mowers,	6	hours	=	54 hours.
„ 6,	Nine „	11½	„	=	103½ „
„ 9,	One „	5½	„	=	5½ „
„ 10,	Seven „	3	„	=	21 „
	Total...				184 hours.

184 hours = 16 days; 11½ hours being a harvest day's work here.

The expenses per day are—

One mower	2*s.*	6*d.*
One woman lifting	1	10
One boy making straps	0	10
One man tying and stooking	2	6
Total per day	7	8

Giving 6*l.* 2*s.* 8*d.* as the amount for the whole field, or 4*s.* 4½*d.* per Scotch acre, or 3*s.* 6*d.* per imperial acre.

"If, in order to make a fairer comparison with the statement of the expenses of reaping by machine in your last Number, we add 47 per cent. for the difference in the price of labour, the result is 5*s.* 1¾*d.*, still 2*s.* 5¼*d.* below the estimated expense with the machine; 3*s.* 8*d.*, however, seems to me unreasonably high for a day's work of 10 hours. The week before last, eight mowers cut down, in good workmanlike style, nearly 80 Scotch acres of Wheat and Oats, some of the latter especially a good deal laid; the whole above the average in bulk and grain, and at a cost of a trifle over 4*s.* 6*d.* per acre. Everything depends on the scythe and its perfect adjustment. A man will accomplish half as much more and with less labour to himself, if his implement is correctly set."

Some years since, we remember a farmers' club astonished itself by coming to the knowledge of the enormous differences of cost at which its members respectively maintained their horses. Some were at something like double the expenditure of others in the provision of food. We believe that equal instruction and surprise would be the result if our readers would compare notes as to the cost of harvest work by different methods in their respective neighbourhoods. We hope some may be induced to follow the example of our correspondent "E. T. B."

THE SCOPE FOR SAVINGS BANKS.

[Extract from a village lecture—the reference in the first paragraph is to a well-known, widely published diagram.]

WHAT I propose doing is to point out some broad facts, which must convince any reasonable mind that working men, as a body, can save to a considerable extent if they choose. You see these parti-coloured patches on the calico—*this* is the amount of our annual taxation, 50,000,000*l.* of money; so much goes to pay the interest of the national debt, so much to pay for ordnance, army, and navy, and so much to defray the other charges of the government of this country. Now, what is this much higher column by its side? It represents the amount annually spent by the working classes alone in beer, spirits, and tobacco; the amounts are given by the late Mr. Porter, of the Board of Trade, a man than whom no one was better qualified to state the truth, both by his knowledge of it and his love for it. 25,000,000*l.* are spent by the working classes of this country annually in beer and porter; 24,500,000*l.* in spirits; 7,500,000*l.* in tobacco, and no account is taken in these large amounts of the large quantities smuggled into the country, nor of the quantities of cider and home-brewed beer that must be drunk. Now, just contrast all this with the small column by its side, 6,000,000*l.* spent in poor-rates, and 1,000,000*l.*, or rather less, which includes all the contributions to 12 of our largest and most influential benevolent societies, such as missionary, bible, and pastoral aid societies—57,000,000*l.* spent by the labouring classes in intoxicating liquors and tobacco annually! It is one-half more than the whole rental of the land of this country; it is far more than the whole taxation of the country; 10 times as much as all our poor-rates; 60 times as much as we give to these benevolent societies. Were only 50,000,000*l.* of this money devoted to the purchase of land, it would afford every year a quarter of an acre each to 2,000,000 labouring men, reckoning the land at 100*l.* per acre. I take these facts from a little publication which I have seen, which well deserves the thoughtful study of the working man. It is a sheet entitled British Taxation, published by Tweedie, Wellington Street, London, price one penny. I have been a teetotaller for many years, and if working men generally were teetotallers as well, what an addition to the material wealth of the population would accrue. That such drinks are unnecessary as an article of diet is proved by the experience of thousands of working men, and others in all parts of the kingdom. That you may safely, as regards health, give up their use is proved by the following opinions signed by 2000 medical men.

"We, the undersigned, are of opinion—I. That a very large portion of human misery, including poverty, disease, and crime, is induced by the use of alcoholic or fermented liquors, as beverages.—II. That the most perfect health is compatible with total abstinence from all such intoxicating beverages, whether in the form of ardent spirits, or as wine, ale, porter, cider, &c. —III. That persons accustomed to such drinks, may, with perfect safety, discontinue them entirely, either at once, or gradually after a short time.—IV. That total and universal abstinence from alcoholic liquors and intoxicating beverages of all sorts, would greatly contribute to the health, the prosperity, the morality, and the happiness of the human race."

That the intoxicating liquor used in this country is the great source of all the crime which disfigures our daily history, is amply proved by the very best of evidence. What says

Judge Coleridge: "There is scarcely a crime comes before me that is not, directly or indirectly, caused by strong drink." —Judge Gurney: "Every crime has its origin, more or less, in drunkenness."—Judge Patteson: "If it were not for this drinking, you (the jury) and I would have nothing to do."—Judge Alderson: "Drunkenness is the most fertile source of crime; and if it could be removed, the assizes of the country would be rendered mere nullities."—Judge Wightman: "I find in every calendar that comes before me, one unfailing source, directly or indirectly, of most of the crimes that are committed—intemperance."

Now, undoubtedly, this way of presenting the general results of a whole country before the eye has its advantages in the imposing magnitudes to which it calls attention—but it has its disadvantages as well. An individual loses himself in the multitude, and forgets that he is personally interested in the case. Many a young man has thus looked at the subject without feeling any necessity that he should himself lend a hand to the temperance movement, or himself join the party who aims at putting down the evil; and I would not wonder if there be not many a young man here who is saying to himself "I shall not make myself singular, and get laughed at, for no reason at all. I know plenty of respectable men who are not teetotallers, and I see neither harm nor danger in the moderate use of beer and spirits." Well! be it so. Many no doubt will think and say all this, and hold it to be conclusive and satisfactory upon the subject; and I feel sure that it must somewhat stagger them to think that there never yet was one who died of delirium tremens, or drank himself to death, who did not *once* just think and say the very same. But it is not to the moral bearing of this subject that I wish particularly to refer,—it is to the material relations of the subject; and I believe that it is in the matter of intoxicating drinks that working men will find their chief means of saving. I was talking with a gentleman some time since upon this subject, and he said that he did not believe that working men as a body were able to save; that he did not believe that, as a general rule, men *were* able unassisted to maintain themselves from youth till death: but what a confession was this;—it involves the idea that the nation is essentially pauper and insolvent. Why, I would say it with confidence, whether I had studied the subject or not, but merely from my certainty of His wisdom and His goodness whose Providence maintains us all, that as a general rule, let a man act from youth till manhood in the right use of all his abilities and faculties, yielding implicit submission all the while to the commands of an intelligent conscience, and, if he please, he may increase in worldly wealth as well as mental and in moral wealth from year to year. I submit to you that these facts regarding the consumption of spirits and intoxicating drinks prove as much; the fact is, after all, that a man must be dependent either on the one column or the other—either on his own share in the 57,000,000*l.* saveable by the disuse of these intoxicating stimulants, or in the 6,000,000*l.* collected for the maintenance of paupers; he had better, like a reasonable man, choose his share in the larger sum, and commence to lay it up at once. And this commencing at once is a very important matter indeed. Boys and girls may have deposits in the savings banks, as I shall immediately explain; and this reminds me of another source of saving in which they can, I believe, take part. I am unable of my own knowledge to say much upon the subject, but I was told that it is worth while to make a reference to the article of dress.

I will here merely refer to it and dismiss it in a single sentence. I do not know whether it be necessary to remind them of it, but I can assure young men that the old proverb does not speak the truth—the tailor does not make the MAN; and whether there be any corresponding profession which pretends in some similar way to confer true womanhood I do not know, but I am quite sure that if there be, its pretensions are equally absurd. Let us seek for that higher standing among our neighbours which is a proper and legitimate object of pursuit in the possession of moral and of mental superiority, and not in that petty spirit of mere outward dandyfication, which really is not only a very paltry but a very expensive affair, and by the abandonment of which, therefore, I believe that there is considerable room for the acquisition of wealth.

Well then, I now come to modes of investing all these savings, which is a very important part of the subject, and on which I have still to occupy your time for a quarter of an hour. They may be arranged in three classes:—1st, Benefit societies, by which maintenance during sickness is provided, and which are a very necessary institution to any one, whether he join a savings bank or not; 2d, Life assurance societies, by which means are, to a certain extent, provided for a family after the death of the head of that family; and 3d, Savings banks, properly so called, by which means can be accumulated for use at any future period during life; and under this class I would name what are called benefit building societies, and also—for it is a means of saving fragments of time and labour which would otherwise be wasted—the allotment system. Of course, on all these many subjects I can do little more than enumerate and characterise, without much criticism.

(*To be concluded next week.*)

THE PIG.—No. IV.

The Fattening of Pigs.—This will in a great measure depend upon the age of the pig and its ultimate destination. As *Roasters* they should be fed while sucking the dam. The sow, while suckling with the view of fatting the progeny, must be supplied with the most nutritive diet, as Oatmeal and milk, of which the young piglings should be taught to partake, or she may have warm whey or wash mixed with Barley, Bean or Pea-meal, or bran, on which all will thrive well, and the major part get fat; they should then immediately be sold from her. It is usual to castrate the males and spay the females at the age of six or seven weeks, and while with the sow, but roasters should not undergo these operations. As *Porkers* the fattening may be advantageously proceeded with so soon as they are weaned from the sow; for this purpose great attention is required, and the most suitable and nourishing food must be supplied to them; their bed must be kept as clean and their sty as wholesome and airy as possible; their food should be milk, mixed with Pea-meal or Barley-meal, given with great regularity three times a day, for at least the first three weeks subsequent to the weaning, when warm whey or wash and a little admixture of bran or pollard, may be added to the meal to reduce the cost of feeding. It will also promote their improvement if they can be occasionally washed with warm water; this is quickly done by pouring it over them from a watering pan. When gathered into a corner, their little feet will scour each other's backs pretty well, if they are made to jump over each other, as they will do for a short time; this must be discontinued as they become well fatted.

The above applies exclusively to fattening pigs from the sow; there are several things to be considered in the ordinary process of fattening pigs; and the choice of pigs for fattening must depend, as we have just said, on the purpose for which they are intended. If fattened for bacon the large breed of a good age must be sought for; if for pork the smaller breed is best, and the most profitable age for feeding will be at about 15 to 20 months. The pig in either case that evidences the most good points, and appears to carry the greatest relative amount of good lean flesh, is to be preferred, and will prove the best on being slaughtered.

The Pig-sty.—The choice being made, the next thing for consideration is to provide for their ease and comfort, so as in the speediest time to complete the fattening; the aim should be to give them a good home or sty for this purpose; this should be airy and have sufficient space for all the inmates to rest quietly, without crowding or disturbing each other, and it should front the south. Two compartments are almost indispensable; the one an open yard, the other covered and nearly closed up, having merely an entrance just sufficiently large to permit a well fed pig to pass in; it must be raised a few inches, and well paved. The pig, notwithstanding he has the misfortune to sustain a character for filthiness, is in reality a very cleanly animal. His sleeping apartment is always clean and comfortable, that is, if he has the means to make it so; his droppings are invariably deposited in his yard, and as his sense of smell is very acute, he will become more or less restless if they are not taken away; and some time must elapse before a cleanly pig will become accustomed to a dirty sty. The old adage, that "pigs can see the wind," has its origin in this keen olfactory sensitiveness. It is absolutely necessary for their best progress that they be kept quiet, clean, and free from either cold or heat. The pig trough should be fixed in the front wall of the open yard, so as to be fed from without, provided with spouts or doors, to prevent intrusion from the poultry or the other animals, who generally throng round the pig-feeder at feeding time. The pigs' or feeding side should be divided by slabs, so as to give every pig a berth, which they will soon learn to take, and thus feed less voraciously than when pushing each other from side to side, each trying to obtain the largest share. Many contrivances are resorted to where litter is scarce. An open floor made of deal evenly sawn, and leaving narrow interstices for drainings and droppings, appears to be most popular. Sand, peat, fine gravel, form very pleasant lairs for a short time.

The various articles recommended as food for the economical fattening of pigs would almost exceed belief. We have all the varieties of grain commonly grown in this country; we have nearly all the varieties of root crops commonly grown, besides some foreign introductions. We have them before us in so many ways and means, and under innumerable modifications; we have Barley-meal, Bean and Pea-meal, Oat-meal, Wheat-meal, Indian Corn-meal, Linseed-meal; then we have Mangolds, Turnips, Carrots, Potatoes, and almost all other roots. Again, we have bran, pollard, starch refuse, brewers' grains, malt coomb, greave cakes, &c. And to form suitable mixtures of the above ingredients, we have milk, whey, butter-milk, distillers' wash, and various soups and porridges, all to promote the fattening and tempt the feeding propensities of "poor piggy." *C.*

ON THE DENTITION OF THE OX.

[The following remarks on this subject are taken from Professor Simonds' lately published instructive Lectures, pp. 59—78.]

To commence with the birth of the calf. The condition of the teeth at birth is subject to great variation. It not unfrequently happens that as many as six of the temporary incisors have thrust their edges through the gums, while in other cases none as yet have made their appearance. These differences probably depend rather on the variations in the periods of utero-gestation than on any other circumstance. The offspring, it is true, inherits the qualities of its parents, and among them may be an aptitude to arrive at early maturity; but it

is stretching the point to infer that such a power is the true cause of cutting the teeth while the fœtus is *in utero*. This ground might probably be defended by some; but when we see the great differences there are in the times of gestation, it appears to me that here is sufficient to account for all the variations we observe.

The presence of four incisors at birth is, I believe, the rule; more or less being an exceptional number. At this time, also, the outline of the other teeth, as ready to cut the gum, is distinctly visible beneath the tissue. The third pair is usually through by the 12th or 14th day; but the corner or fourth pair seldom penetrates the gum until about the end of the third or beginning of the fourth week. By the time the calf is about a month old all the incisors will therefore be *in situ*.

The eight temporary incisors of the calf are in all respects, excepting size, the counterparts of the permanent by which they will be succeeded. The first or middle pair is the largest of the set, and the corner the smallest, a gradual decrease taking place from the one to the other. These teeth, by the end of the fourth week from the growth of the maxillary bone, are less crowded together than when first cut, although they are still observed to be partially overlapping each other. Not only are the incisors all up by this time, but the temporary molars are also in their place. It may be again necessary to state that they are 12 in number, three occupying each side of both jaws (upper and lower). The temporary molars have many peculiarities, the chief of which must be named, as these teeth likewise furnish important evidence of age during the early period of the animal's life. At birth none of the molars have cut the gum, and it is not until the calf is a month old that they are well developed. Like the incisors, they follow no special order of eruption, but more frequently than otherwise the first in position is the last to be cut. The first and second of the temporary molars in either jaw do not differ essentially in form from the permanent, by which they are succeeded. If we compare, however, the teeth of the upper jaw with those belonging to the lower, it will be found that the two anterior ones in the latter are much smaller than the corresponding molars of the former, still these points are of less practical importance than others which have to be named. The third in position of the temporary molars in the lower jaw varies considerably from all the others, as also from its permanent successor. It differs likewise as greatly from the fourth in situation, the first permanent which is put up, and with which it can scarcely be confounded even in a casual examination, if the following particulars are borne in mind. It is the last of all the temporary molars which, as a rule, is renewed, and consequently throughout it furnishes much assistance in determining a question of age. It occupies a space in the jaw equal or even greater than both the molars together which stand before it, in consequence of its increased width from front to back, which however would be more correctly called its long diameter. It is composed of three main parts or lobes of a semi-cylindrical form, having in the hollows between them, on the outer side, two smaller portions which also rise into asperities or cusps. The latter, when the tooth is somewhat worn down, add both to the strength of its body as well as to the irregularity of its grinding surface. Each of the three principal lobes likewise rises into cusps, an inner and an outer, of which the inner are always the highest.

These particulars suffice to distinguish the third temporary molar so well, that in examinations of the mouth it is quickly recognised. By merely bearing in mind that this tooth has three lobes, while both the fourth and fifth molars have but two, and that when it falls it is renewed by a tooth similar in size and form to them, we recognise immediately both the number and kind of molars which occupy the mouth. It may be added that the form of this tooth beautifully adapts it to its office, for in the act of mastication each of its projections intersect those of the corresponding molar of the upper jaw, and thus effectually grind down the food which is submitted to their action. The putting up of the temporary incisors and molars at about a month completes "first dentition," and as there are now a given number of teeth, so any addition to them will mark an important stage in the further process of teething. When this addition takes place, the temporary teeth, merely by their number, cannot avail in our inquiries, nor can they be said materially to do so up to that period by the slight wear they may have undergone. The general appearance of the young animal, for the first few months, suffices to form a fair estimate of its age. As the temporary incisors agree in number with the permanent, but the temporary molars are but a moiety of the whole of these teeth, so the addition is necessarily made to the latter. Inquirers into the age of the ox have assigned very different dates for the appearance of the first permanent molars. Most of our authorities concur in saying that these teeth are cut when the animal is about a year old. These statements, however, are far from being correct, as these teeth are put up when the calf is six months old.

The next important stage in dentition is the cutting of the fifth molar in situation, the second permanent. This takes place at 15 months; but as in the interim well marked changes have come on in the temporary incisors, so it is necessary to direct attention in the first instance to these. From six to nine or ten months, the edges of the incisors, which at the former date were rather blunted, have been gradually giving way to attrition; this perhaps would be scarcely recognised in an ordinary examination. After the latter period, however, it becomes more and more apparent, and when the animal is a year old, the four centrally-placed teeth, in particular, will be worn rather flat on their crowns. These teeth also are now beginning to show spaces between their fangs. These changes are regulated partly by the system of management the young animal has received, and the kind of food on which it has been kept, and partly by the natural width of the lower jaw. If the food has been coarse and the jaw a wide one, the incisors will be more flat and the distance between them greater than otherwise it would have been.

From one year we pass to 15 months, when, as before stated, the fifth molar tooth is put up. This tooth does not essentially differ in its shape or dimensions from the fourth. Its cutting, however, at 15 months, at a time that the incisors do not offer any satisfactory evidence of the precise age of the animal, is a point of some utility to an investigator of age. The regularity in the periods of the appearance of the permanent molars is pretty uniform. The fourth, as we have seen, is cut at six months, and the fifth at 15, the sixth follows at two years—an interval of nine months elapsing between each. This gradation is easily remembered. Like the fourth molar, this tooth also acquires its full height in the jaw about three months from the time of its cutting. Attention must now be directed to the state of the incisor teeth at 18 months. It was shown that at a year old the four middle-placed incisors, in particular, gave indications of wear, by the loss of their sharp edges and increasing flatness of their crowns. By 18 months this flatness has considerably increased; it is not now, however, confined to the teeth placed in the centre of the mouth, but has extended to all. The jaw of the animal has also grown wider, thus increasing the spaces between the teeth, so as to leave not merely their fangs apart, but likewise their crowns. To compensate, in part, for their diminished length the teeth have likewise risen in their sockets; and as some of them are soon to be renewed by the permanent incisors, the process of absorption has commenced in their fangs. These various causes, more or less modified in different animals, give to the mouth an appearance which is quickly recognised. To these indications of age have to be added a diminished whiteness of the teeth, the part of their crowns which is exposed being that which is covered by a thin layer of enamel: the existence also of yellowish lines on their wearing surfaces, which indicate the outline of the once open pulp cavities; and the discoloured state of their fangs, from the action of the food and secretions of the mouth upon the crusta.

(*To be continued.*)

NOTES ON EXPERIMENTS IN THE GARDEN OF THE ROYAL AGRICULTURAL COLLEGE.

By Professor James Buckman.—No. VI.

It remains, in completing these notes, to make a few observations on the Grasses which I have had in cultivation, as although these are few (only 23 forms) yet as they belong to a tribe of plants of such great use to the agriculturist, every individual is capable of furnishing matter of interest to him; for those that do not possess value for their feeding properties will be found to be indicators of peculiar and unexpected facts regarding the nature of the soil in which they grow spontaneously, whilst the cultivated ones are no less indicative of natural barrenness and fertility than of good or bad husbandry.

My list of Grasses comprehends the following.*

1. Anthoxanthum odoratum; Sweet Vernal.
2. Alopecurus pratensis; Meadow Foxtail.
3. Phleum pratense; Timothy Grass.
4. Hordeum pratense; Meadow Barley.
5. „ murale; Wall Barley.
6. Avena fatua; Wild Oat.
7. Arrhenatherum avenaceum; Oat-like Grass.
8. „ var. bulbosum; Knotted Couch.
9. Holcus lanatus; Soft Grass.
10. Dactylis glomerata; Cock-foot.
11. Poa pratensis; Smooth-stalked Meadow Grass.
12. „ trivialis; Rough-stalked Grass.
13. „ nemoralis; Wood-stalked Grass.
14. Festuca pratensis; Meadow Fescue.
15. „ elatior; Tall Fescue.
16. „ loliacea; Upright Fescue.
17. „ duriuscula; Hard Fescue.
18. „ ovina; Sheep's Fescue.
19. „ rubra; Red Fescue.
20. Bromus erectus; Upright Brome Grass.
21. Lolium perenne; Perennial Rye Grass.
22. „ Italicum; Italian Rye Grass.
23. Triticum caninum; Fibrous-rooted Couch Grass.

These examples were originally drilled in plots of 2½ yards square; the drilling being adopted, to facilitate weeding. Since their original planting, many of them have stooled out, and now cover the beds as a matted turf; some others have made a turf by seeding, whilst others still grow in distinct and separate bunches—'hassocks.'

Now, allowing the examples to seed exhausts the individuals thus left, the consequence of which is that many of the old plants die out yearly, and a narrow observation of this tendency to die after seeding would show us in a clear light the evils of getting late into the hay field, for though by this we may increase present bulk, it is at an after expense or loss.

There is always a great difficulty experienced in keeping patches of separate Grasses pure from admixture of other kinds, as the original crop has a tendency gradually to diminish with seeding,* and one or two individuals of another species will then make rapid advances; in their turn being expelled by others, and thus as new circumstances and conditions arise there is constantly going on a change of crop. Now on carrying these observations into the field, the same facts will be observed; judicious management of meadows for a few years will cause not only an increase in quantity of produce, but there will be a large increase in the proportions of good feeding Grasses as compared with those of a low standard in this respect; and, indeed, what are termed sour Grasses, will be almost, if not entirely, eradicated. How immediately is the Aira cæspitosa, Turfy Hair Grass, or Hassock Grass, killed by draining; and on poor uplands the tufts of Brachypodium pinnatum, and sylvaticum, Avena pratensis, and the like hard Grasses, give place to the advance of better kinds by a single dressing of bone-dust and guano, or what is perhaps more valuable, folding sheep upon a small space of such land at a time, feeding them with hay, corn, and Turnips.

Indeed, such exact indicators are Grasses of all the circumstances connected with the nature of soil and its treatment, that I feel convinced that a more careful study of their habits would afford the most valuable lessons the farmer could learn, whilst the land-agent and valuer would find the evidence this tribe of plants is capable of yielding, an unerring testimony in many of the matters upon which he has to adjudicate.

Another circumstance in the cultivation of Grasses in the separate form and small patches is the impossibility of rolling or treading it firmly, without which no pasture can continue good. In truth, though we talk of natural meadow, yet there is no meadow that would continue as such without its proper cultivative processes. It is these that keep the Grasses matted together, and hay-making and depasturing are both important in maintaining its condition; in proof of this I may quote some recent observations in the United States. Here the native Grasses are scattered in tufts and patches, much like other herbaceous plants, while all the pasture has been made from the cultivation of British Grasses. In my own researches into this tribe in America, I made out as many as 30 species of introduced British Grasses entering into the pasture, especially of the States of New York, Pennsylvania, and Ohio.

1. The two first species of Grasses on our list were recommended by a writer in the *Gardeners' Chronicle* some three years' since, for separate culture as an early feed; as regards the Anthoxanthum odoratum, my experiments show that though early the herbage is too scanty to be of much use, and besides, though it is a most valuable Grass to mix with others, from the flavour which it imparts, yet, by itself, it is too bitter to be greatly relished by cattle in continued use. Its culms soon die, and although of perennial habit, it throws up but a very slight second herbage.

2. The Alopecurus pratensis might be profitably employed as a self Grass, especially in rich lowlands. In such a situation, at the foot of Silbury Hill, Wilts, during a visit in the first week in May, 1849, an unusually cold spring, I walked through a field of this Grass which was being folded off by sheep, and a more luxuriant crop, or better herbage, I never remember. It also does well where irrigation can be adopted, but it does not succeed well on the uplands. My garden specimen, however, yields an average crop, which endures cutting admirably, and throws up a tolerable second culmiferous and leafy growth.

3. Phleum pratense, Timothy Grass, is not employed in England as a self crop, yet my experiments show that it is admirably adapted for the purpose; indeed, better in this country than in America, where it is the most commonly used self Grass crop. With us the herbage is not so rank and coarse as in America, where it often grows as much as 5 feet high, with flower spikes 4 inches in length. In the States of New York and Pennsylvania I saw hundreds of acres of the best cleared land occupied solely with this Grass, of which, indeed, the great bulk of the Grass-hay of the country is made. Here so strong does it grow as, at a slight distance, to be capable of being mistaken for a grain crop, a circumstance which will doubtless explain how it is that the American reaping machine should be capable of cutting Grass in its own country, while experiments with this implement on British hay-fields have been signal failures. The Timothy is a Grass which yields a great deal of nutritious produce; it is eminently perennial, bears cutting tolerably well, but on account of the lateness of its ripening cannot be expected to produce an abundant aftermath. One great advantage it possesses is its capability of resisting drought, which is doubtless a great cause of its employment in the States, where the summer is intensely hot, and with often whole months almost without rain. On this account it may be worth trying on some of our dry uplands, or on light sandy soils, where, even in England, in a dry season, we often observe Grass vegetation as scant as in the warmer parts of America.

4 & 5. Hordeum pratense and murale are both examples of Grasses which cannot be esteemed for hay, on account of the long awns which are attached to the flowers. The awns of most Grasses, but especially of the Barleys, being themselves armed with a double row of minute spines, which causes them to stick on the tongue and in

* It will be observed that this list does not contain any examples of what are usually called artificial Grasses, but only include, plants belonging to the natural order Gramineæ, to which remarks upon Grasses should, at least in scientific journals, be confined. It is, however, curious to find how the term Grass, which was in old time used generically for any green herb, should still be misapplied; thus we have Scurvy Grass, Grass of Parnassus, Rib Grass, and the like. As regards the latter, one of my pupils informed me that he was much ridiculed by a Cheshire farmer, to whom he showed a collection of the British pasture Grasses, for not having included the Rib-grass (*Plantago media*).

* My specimens being grown in order to show them to the students in all their phases, are obliged to seed.

the throat, and produce great irritation. Otherwise these Grasses would be highly valuable, as they rank high in nutritive properties; the first, however, does not yield a great abundance of leaves; the H. murale, on the contrary, though late in flowering, grows a great quantity of leaves, and that, too, very early. From my experiments of last year I am inclined to give this a higher position as a pasture Grass than I at one time thought it deserved. Its proper habitat is in sandy places, where it grows hard stiff culms, but it can be cultivated on clays, where it increases in abundance, and is not so coarse.

Home Correspondence.

Skilled and Moral Labour.—Having observed some articles in the *Agricultural Gazette* recently, bearing on the want of skilled labour, I am led to call your attention, and that of your readers who may be rack-renting farmers, to the want of moral labour, which is no small grievance. In a general sense this is mainly a question of education, but as the annual hiring fairs are near at hand, I desire to point out, from among many loose habits of farmers, a most impolitic practice of hiring their farm servants without any inquiry into their characters. Character is the main capital of household servants. With all careful and experienced housekeepers it is the subject of strict enquiry and scrutiny; and in such houses the honesty, sobriety, and general behaviour of servants is very remarkable, amid the temptations always before them. Such has been my experience of household servants. Now, as respects farm servants and labourers, my observation has led me to form a very different opinion; and that, generally speaking, there is little dependence on their honesty, their industry, sobriety, or decent conduct, though I have known many worthy exceptions. Yet this is the class from which our household servants are supplied. I believe this difference arises solely from the circumstance that, in the one case, character is an essential qualification, and is not in the other. The household servant learns by experience that character is a valuable property, and always available; whereas, in the other case, mere physical power, accompanied by some experience in the particular service required, is deemed all-sufficient. I recollect having once written to a large farmer to inquire the character of a man who offered his services to me as a shepherd. I got no answer to my letter, which I thought uncivil, and on complaining of this to a neighbour, the master was excused, on the ground that farmers did not require, nor were expected to give, characters of farm servants. I can hardly conceive anything more grossly improvident and injurious than such a practice, whether as respects the hirer or the hired. If the mischievous results of this practice were confined to the former, no one need complain, but it unfortunately destroys, amongst a very large class of the population, the most powerful motive to abstinence from all offences which would be a bar to their preferment. *Magister.*

Ears of Wheat.—The object in sending you the enclosed ears of Wheat is to make known that they were taken from a sheaf, the produce of seed sown after Turnips on marled land, on March 31, 1853, which attained to perfection, and was harvested by Sept. 25 following, yielding 3½ qrs. per acre; in six weeks after, however, a portion of it was again sown as seed after Rape, and the produce is that of the present harvest, say about 6 qrs. to the acre, and it would in all probability have been greater had the plants stood thick enough on the ground; besides this variety of Wheat having many properties to commend it for extensive cultivation, there is one that deserves mention, viz., that (with us) it resists the heaviest rains without being beaten to the ground. Perhaps the above remarks may tend to dispel the idea so prevalent, that Wheat sown in spring should not be used for seed in the succeeding autumn. *P. Deane.*

Are Farmers sufficiently grateful for Abundance and fine Weather?—This query has been lately presented in a variety of shapes; in some cases the assumption of a superior degree of thankfulness would seem to require that some parties should first examine the grounds on which their own pretensions to gratitude are raised. It is so easy for a certain class of persons to claim virtue at the expense of their neighbours! Favourable weather and a large comparative addition to the actual resources of the country must afford to all reasonable men great satisfaction, and heartfelt acknowledgment to the Giver of All Good for so merciful an interposition in a nation's favour; and shall any particular interest or party arrogate so much greater sanctity, or propriety, as to constitute itself a judge and decry the merits of any other interest or party, on a subject about which all may equally desire to express thanks without derogating from the joy of any? The consumers of food include the producers of food, and if they (the consumers) rejoice in the prospect of a cheap and a good loaf, the producers have this season, at least, additional reason to be glad at the uninterrupted fine weather that has lessened the cost of securing so bountiful a harvest; and also that their labourers and poorer countrymen will, in all probability, have a better description of sustenance than usual to partake of during the ensuing year, at such a moderate cost as, with plenty of employment, the resources of almost every family will be able to command enough; considering also that prices are likely to be remunerative, no better security for a cheap loaf in future can be found than in the good crops of the present year. The addition to the capital of careful and judicious farmers will ensure so much more improvement in the treatment of the land, in the employment of labourers, in the attraction of further capital to the agricultural interest, and in, perhaps, other modes not anticipated, that after, we will say, a proper expression of thanksgiving has been fervently and unhesitatingly offered for the immediate and direct consequences of an unusually large growth of corn, we may all join in congratulation on its indirect advantages, in the fact of all connected with farmers being able to spend more money in the industrial products of the manufacturing and commercial part of the community, and in the ability of farmers to avail themselves of the spirit of enterprise and improvement to provide in future years, under the blessing of divine Providence, a larger supply of home-grown corn to meet the growing wants of an increasing population: a fair and impartial view of the question will exclude Pharisaical uncharitableness, and unite all in a due sense of the benefits accruing to the country from a plenteous supply of food; the importance of the agricultural part will be recognised without envy or malevolence, and the blessings of unrestricted industry be so much better appreciated that we shall be able to approach further ameliorations and improvements, so as to remove some of the remaining evils which are still permitted to lurk in our institutions and habits, and hence derive additional cause of gratitude by using the gifts bestowed upon us in a right spirit for the advancement of civilisation. *J. W., Peterborough.*

Thin Sowing.—In reply to your remark on our article of the 9th inst., that our experiment of growing corn on small plots is "entirely useless for the purpose of calculating from it acreable produce," permit us to say that if the principle were carried out on a broad scale all in square yards alternately, thus, only half cropping the land, and only half as much produce were obtained upon them, as we have described we grew on one square yard, it would even thus very far supersede crops usually grown. We agree with you that it is no just criterion that a proportionate yield could be obtained from an acre, as from a yard, as there would be more outside rows on the yards than on the acre, but it goes very far to prove that a very considerable larger crop could be grown on such a principle, than is usually produced from ordinary thick seeding; and the plan is but just tantamount to Mr. Smith's, of Lois Weedon, and goes to confirm his principle to be correct and good, viz, cropping only half the land; but with all due deference to Mr. Smith, his row system is the best of the two, inasmuch as it admits of fallowing and cleaning by horse labour, &c. His principle is the same as our own; with this difference, however, that we improve by sowing thinner than he does, and take credit for persisting in our motto, "sowing early, and isolating each plant with more precision, whether thick or thin, than he and many others consider essential, to realise the best of crops." *Hardy & Son, Maldon, Essex.*

The Causes of the late Good Harvest.—The harvest of the present year (1854) has been so universally excellent, both in quantity and quality, that it would be profitable to inquire what causes, meteorological or otherwise, have conspired to produce so favourable and unexpected a result. I say "unexpected" because, when we consider the remarkably long sunless period of May and June, and the prevalence of insects and disease on trees and plants generally during the past season, one would have been disposed to predict anything but such an abundant harvest as we have had. Since 1844 we have certainly experienced no harvest like it; and I am told (though I do not remember it) that the harvest of 1815 was just such another. Now, were the meteorological features of 1815, 1844, and 1854 at all alike?—and, if so, in what particulars? This is the question I would respectfully propound to your numerous meteorological readers; and I think the subject an important one, because if it should appear that those seasons were alike in certain great features, it would afford grounds hereafter, when we meet with a recurrence of those features, for looking forward with some confidence to a repetition of the abundance and quality of the memorable harvest of 1854. You will see I have limited the inquiry to causes meteorological. The result has been so uniform throughout the country, that the cause which has produced it must be an equally universal one. Indeed, the present harvest proves that if only the meteorological conditions are propitious, almost any land and any sort or style of farming will produce a fair crop. Now how is this? The glorious sun adds no inorganic constituent to any soil. It puts nothing in, which was not there before, and yet the plant finds somewhere and somehow the indispensable phosphorus, sulphur, and ammonia, without which corn is an impossibility. The proximate cause of all this cannot be in the farming, nor in the land; we must look for it further a-field, viz., in a happy coincidence of physical causes, or, in other words, meteorology. If genial airs, genial showers, and genial sunshine can add no inorganic constituent to the soil, they may and do so invigorate the constitutional powers of the plant as to enable it to dive its roots deeper and spread them further, and to seek out, seize hold of, and assimilate more of its real pabulum than under ordinary circumstances of seasons it could do. It is clear that the causes of a universally good harvest must be either positive or negative. Positive in the presence of favourable conditions, negative in the absence of unfavourable conditions. Now the positive must be solely meteorological. The negative, on the other hand, may be both meteorological, entomological, and fungal, and it would be a highly interesting fact, if in the progress of an inquiry such as I have indicated, the last two causes of mischief, viz., insects and fungi, should be enumerated, as being in fact dependent wholly upon the former, and that, therefore, it is to meteorological causes alone that we must ascribe both our good and bad harvests. Without much acquaintance with meteorology I speak diffidently; but I venture a guess, that dry weather will be found to have had more to do with our late magnificent harvest than anything else. The old proverb that—

> "A dry May and a dripping June
> Brings all things into tune,"

at any rate will not hold good this season, for the month of June was unusually dry. To my mind, there is far greater truth in another proverb, which, I believe, is more current among millers than farmers, viz., that "it was never known to *rain* flour." *W. Marshall, Ely, Sept.* 21.

Farm Memoranda.

THE PALACE FARM, ARMAGH.—While at the great national show at Armagh, in August last, we took advantage of the opportunity afforded to visit and examine the Palace farming, under Mr. Yule. On inquiry we found the area available for farming purposes, exclusive of those portions of the demesne under plantations, pleasure grounds, &c., amounted to about 300 statute acres—viz., grazing 130, meadow 90, and tillage 80 acres. The Grass lands are rather light and wet, and in some places the rock lies near the surface, surrounded and interspersed by woods and plantations; but that part to which the tillage is confined is a heavy clay, and exposed to a north-west aspect. The rotation adopted by Mr. Yule is a peculiar one, being a modification of the four-course, and admirably suited, in a general way, to the requirements of the farm, which will be best understood by the following:—

No. 1. 20 acres of manured green crops, consisting of 5 Potatoes, 5 Mangolds, and 10 of Swede Turnips.
No. 2. 20 acres of Wheat; one-half of the Turnip break being sown with Spalding's Prolific spring Wheat.
No. 3. 20 acres of winter and spring-sown Beans, after Wheat, without manure, but the ground thoroughly cleaned and pulverised.
No. 4. 20 acres Wheat, after Beans, which is invariably of a superior crop to that sown after a manured green crop.
Which finishes the rotation, and it begins again.

Mr. Yule sows no Clover or Grasses, having so much permanent Grass land, and it being so situated as to render it inconvenient and disagreeable to break it up; and it will also be observed that he grows neither Oats, Barley, Vetches, Rape, nor Clover. Now for the results. We find an account of stock is taken every year on the 1st May, and the accounts closed up to that period. We were favoured with a view of the balance-sheet for the year ending May 1, 1854, which, after deducting all expenses, including a very high rent (427*l.* 3*s.* 9*d.*), poor-rate, cess, insurance, income tax under schedule B, steward's salary, and five per cent. on floating capital, leaves a net profit of 825*l.* 6*s.* 5½*d.* To put the matter beyond a doubt, the accounts have been passed and signed by the agent, Mr. Paton, and audited by a gentleman named Smith. ["To put the matter beyond a doubt," we incline to think that every one will feel the accounts need to be audited by *himself*.] Mr. Yule estimates the profit at 87½ per cent. on the capital employed; but as a great deal of his time is occupied in other duties beyond the farm, he very properly considers that the entire of his salary should not be charged against the farm, and that by charging one-fourth of his salary against the other duties performed, and adding the five per cent. interest charged in the current account on the capital employed, he would have a clear gain of upwards of 90 per cent. Mr. Yule intends making an important change in his rotation, in consequence of the winter-sown Beans having suffered much from blight this season, by substituting a Flax crop for half the crop of Beans, when the rotation will stand thus:—

20 acres of manured green crop,
20 acres of Wheat after green crop,
10 acres of Beans after Wheat,
10 acres of Flax after Wheat; and
20 acres of Wheat after Beans and Flax.

The ground for the Flax to be autumn grubbed and cleaned, and after the Flax is removed to fallow and clean the land for Wheat, and by changing the Flax and Bean crop every rotation, the Flax will occur only once in eight years on the same land, by which he expects to add to the profits considerably.

In going over the farm and steadings we were particularly struck with the great weight and evenness of the Wheat crop, and the luxuriance, cleanness, and regularity of the Turnip crops; the spring-sown Beans were a splendid crop, podded almost to the ground; but the winter-sown had suffered considerably from blight. The utmost order, cleanliness, and neatness pervaded the offices and steadings; and the cattle-house, though empty till the feeding season comes on, were admirably arranged with troughs and fastenings. *Dublin Farmers' Gazette.*

Miscellaneous.

The Hagnaby Sale of Short-horns.—The sale of this valuable stock, the property of John Kirkham, Esq., took place at Hagnaby lately, under the auspices of Mr. Strafford. The interest excited in agricultural circles by the announcement of this sale was very considerable, Mr. Kirkham being well known throughout the kingdom as one of the most spirited breeders of short-horns in this part of the country. The herd consisted of upwards of 80 bulls, cows, and heifers, descended from some of the best stock in the country;

and early in the day the yards and fields were crowded by a numerous company, many of them from a great distance. There had been no attempt to get the stock up for sale, yet they were in useful condition, and the prices realised by several showed that their merits were duly appreciated; one beautiful heifer, 15 months old, after a spirited competition with Mr. Mason Hopper, of Newham Grange, being knocked down to Lord Feversham for 160 guineas; whilst a bull, about a month older, fetched 100 guineas. These two, unfortunately, leave the country, but a fair portion of the stock remains amongst us, including a nine months' old bull bought by Mr. Wingate, of Hareby, for 72 guineas, a price with which he appeared highly gratified; others selling as high as 70, 65, 62, 61, 57, 50 guineas each. The average price realised for the bulls, cows, heifers, and calves was upwards of 35*l.*, the aggregate of the sale being 2945*l.* 5*s.* Mr. Strafford briefly prefaced the proceedings by announcing the conditions of sale, and explaining that, although after the purchase the animals would be at the buyer's own risk, yet every care would be taken of them, and all reasonable accommodation offered. He felt highly honoured in the compliment that had been paid him in requesting him to offer for sale the splendid stock that would be brought before them, and with an inspection of which they must all have been highly gratified. He had had the pleasure of knowing Mr. Kirkham for upwards of 20 years, during which time his name had been familiar to all as a breeder of first-rate stock; any eulogium from him, therefore, was unnecessary, his name being as well known as his judgment was respected. Mr. S. next briefly adverted to the superior breeding of some of the animals, which were then put up and disposed of in the order of catalogue :—

Amount of sale of cows, heifers, and calves	£2284	16	0
Average price...	£32	0	0
Amount of sale of bulls and bull calves ...	£660	9	0
Average price...	£44	0	0
Total amount of sale	£2945	5	0

The Grass Crop at Tiptree.—Some remarks which I made at the last agricultural gathering at Tiptree, have caused a discussion, in which I feel that I have been misunderstood, and therefore beg the favour of a little space for explanation. The most interesting feature of Mr. Mechi's farm this year was his liquid manure system, and on this he chiefly enlarged in the way of instruction. It is not used directly to the corn crops, but the excellence of the Mangold fields shows how beneficial it is to them. The Italian Rye-grass is the only unsuccessful crop, and Mr. Mechi, when his own illustration failed him, very fairly adduced the experience of others. He told us of the marvellous results obtained by Mr. Kennedy, in Ayrshire, whose Italian Rye-grass affords keep at the rate of 70 house-fed sheep an acre. And Mr. Telfer, of Ayr, who was on the ground, corroborated this statement from his own experience, he having got from three cuttings of this prolific Grass, in one season, as much green food as would have made 20 tons of hay per acre! It was, perhaps, no wonder that many were startled by such statements, seeing that this is ten times the number of sheep, and ten times the weight of hay which are usually got. Men cried out, "Impossible!" They would not believe it. Perhaps it is impossible in the eastern counties, and, at any rate, it may be useful to point out the advantage which the moister climate of the west gives it in the growth of Grass. The difference between the annual rainfall of the east and west of Great Britain is reckoned at 10 inches. An inch of rain is equivalent to 100 tons of water to an acre; so that, on the average, nature gives to the western farmer 1000 tons more water per acre than to his eastern competitor. In the growth of Grass we know that all is needed, for in Ayrshire, where these enormous crops of Grass are grown, both Mr. Kennedy and Mr. Telfer feel the necessity of permitting no waste of liquid. During summer they apply the liquid manure early in the morning and late at night; not showering it high into the air, but directing the stream straight to the roots of the Grass, so that none may be dissipated in mist, and as little as possible lost by evaporation. The possibility of growing such crops of Grass under any circumstances was doubted by many. But wherefore impossible? A good crop of meadow hay weighs about two tons. A stalk of Italian Rye-grass is twice the length of meadow Grass. If the stalks stand equally thick on the ground, the Italian Rye-grass will weigh twice as much as the meadow Grass. But if there are two stalks of Italian Rye-grass for one of meadow Grass, the crop of the former will be four times the weight of the latter. To those who have seen Mr. Kennedy's and Mr. Telfer's crops it is unnecessary to say that both these conditions are fulfilled; and it needs but the repeated application of farm sewage to this rapidly-growing Grass, in a favourable climate, to secure three such cuttings in the season as Mr. Telfer affirmed he had got. To the diligent, as Mr. Mechi said truly, time is money, and the axiom could not be better illustrated than by growing three crops in a single season in place of one. A startling statement of any kind is always doubted, and disbelief in matters of this kind is usually in proportion to limited knowledge. Many farmers, because they have never seen it themselves, would say that it is "impossible" on any land in this country to grow superb crops year after year without manure—to have Beans, Wheat, Mangold, Potatoes, Cabbages, Oats, and Swedes following each other in any succession (provided the land is kept clean), each crop most luxuriant, all carried off the ground, and not a particle of manure applied. And yet this may be seen in half an hour's ride from town by the North Kent Railway, on the drained portion of Plumstead marsh, occupied by Mr. Russell. When guano was first introduced, many deemed it impossible that a brown powder, brought thousands of miles across the ocean, would be a hundred times more valuable for the growth of crops than an equal weight of good farm-yard manure. In truth, one of the most serious obstacles to agricultural improvement is to be found in the limited standard which some agricultural teachers have set up as the fixed boundary of agricultural progress. There is no presumption so great as that which glibly cries "impossible" in an age which has produced the electric telegraph. *Extract from Mr. Caird's Letter in the Times.*

Calendar of Operations.

SEPTEMBER.

CHESHIRE, *Sept.* 13.—In our last report we spoke of the grain crops generally as being very promising, more especially the Wheat crop, and we have now the satisfaction of stating that with very few exceptions our expectations have been fully realised; the yield, we may confidently assert, is a full average one, and the quality equal to any we have seen for years. Barley is also good, and has been secured in the finest possible condition, but the sample is not quite so even as the Wheat, owing to its coming up at different times, in consequence of the dry weather at the sowing season. Oats are well filled, but in some instances the crops were light on the ground; the bulk of the corn has been secured, and after about a month of as fine harvest weather as we ever remember may safely say the result is highly satisfactory both to the grower and consumer. Potatoes have, within the last fortnight, shown unmistakeable signs of disease; but probably, owing to the very dry weather, it has not progressed in the way it usually does in wet seasons; in fact, some of our best kinds seem scarcely affected at the time of getting up, probably they will show themselves more or less affected when they have lain in the pit a short time. Pastures and Clover roots are very bare, and on dry land are past recovery for the season. The teams are now very busy, "pin fallowing," and preparing the land for Wheat, or working the land intended for green crops next year, and there never was a more favourable time for these operations. It is to be feared the green crops are suffering materially from so long a continuance of hot dry weather, the early sown Turnips are mildewing, and on dry land Mangold Wurzel has received a severe check. *W. P.*

BORDER OF THE FENS, *Sept.* 19.—Harvest is over sooner than usual, although it did not commence so early as it generally does; the thatching is completed, and the scarifiers are at work wherever the land is cleared of stubble. Potatoes are raised; Mangolds and Turnips have their last hoeing, the latter are better hoed by turning a lamb or two per acre among them; preparations are made to plough, clean, and manure an acre or two of fallows, near the homestead, for winter Tares; and already inquiries are made for seed Wheat, winter Beans, and winter Oats. The threshing machine is again heard buzzing far and near, and the smoke of the steamer is confirming or correcting the anticipations of the farmer, as to whether the yield will average 4 or 5 qrs. per acre. In the mean time the grumblers are mightily deceived in the range of prices, which have baffled their prophecies and calculations; and, in spite of their hurry in bringing corn to market, will keep rising far beyond their expectations. And, as if there should be no possible excuse for complaint remaining, we have had some most refreshing showers during the last few days, which have already restored a tinge of green to the thirsty pastures—arrested the fall of leaves from the excessively dry, and even withered, trees—and given promise of a supply of water to wells and ponds which have taxed the memory of the "oldest inhabitant," as to when they were so low before: and truly the rain is acceptable. Many farmers have been obliged to stock their Coleseed, to keep sheep alive, others regularly fodder their cattle, and the hay and Clover stacks have thus early been cut, although unusually scanty, from the dryness of the summer. Work is still plentiful in these parts;—dykes require cleaning out, stubble is mown or pecked, numerous gaps made by gleaners and cattle must be repaired in hedges, gravel raised for roads, and the hovels and fences round the homestead put in a state of defence against the severity of winter. One hint upon the latter point:—Farm-yards are chiefly guarded against the north and east; but we have for the last year or two suffered equally against the violent winds which so often set in from the south-west, and which sometimes are very cutting, and accompanied by both sleet and snow. Protection from this quarter may be cheaply and readily obtained at this season, by making a stubble wall if there is an open side next a field, or faggots may form a temporary shelter. Wages are dropping to the ordinary rates paid before harvest—12*s.* or 13*s.* a week: labourers seem at present to have no difficulty in obtaining employment, indeed so many are drawn off for building, and for the railways, as well as a few for the army, that it is probable higher wages may be demanded, and good labourers be more wanted, particularly if corn continue to advance, or even retain the present rates. Now is the time to make a final arrangement of the flock of sheep, to cull objectionable ewes, or to fill up deficiencies by drafting a sufficient number of thaves, or buying the requisite addition of ewes at market; and above all things select the right sort of rams. At our great fair on the 2d October there will be some hundreds offered for sale by auction by seven or eight eminent breeders, of Lincoln sheep. They form the great attraction of the fair, and they are by this means distributed annually all over the kingdom. *J. W., Peterborough.*

Notices to Correspondents.

ACCOUNT BOOKS: *C O.* We regret our inability to name any published form of keeping accounts of the produce, &c., of dairies and poultry-yards.

BLACKIE'S CYCLOPÆDIA. *Subscriber.* The last part, No. 28, is nearly all in the printer's hands.

BOOKS: *J R.* For a work of reference on farming generally, "Blackie's Cyclopædia of Agriculture." For information on light land farming, see Mr. Haxton's paper in the last Journal of the English Agricultural Society. For information on Flax growing, read Demann's pamphlet on Flax.—*Mr. J. Ramsden.* White's "Compendium of the Veterinary Art," Youatt on the Horse. *W. C. S.*

DISEASES: *C R P.* The ears of Wheat are infested with the common red rust, and every grain is bunted. You say that it is very prevalent in the neighbourhood of Andover. Are not proper precautions taken against bunt by dressing the seed grain with lime or some other substance which is capable of destroying the spores of the bunt? *M. J. B.*

PRICES: *A F B.* Many thanks for your note. The prices of ordinary farm operations differ materially in different localities. We will give a list next week. The cost of a man and pair of horses may be put at from 6*s.* 6*d.* to 8*s.* per day, and this will enable you to calculate some of the items.

PROBANG: *T S B.* If you have any better plan for removing obstructions from the throat of cattle than the ordinary instrument for that purpose, you had better publish it, or patent it. Such a thing would, no doubt, benefit many of our readers.

WEIGHTS: *F D.* A truss of hay we believe weighs 56 lbs., and of straw 36 lbs.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made.

TO NOBLEMEN, STEWARDS, AND OTHERS.

J. WRIGHT, 36, Boar Lane, Leeds, begs to call the attention of parties about to improve their Farm Estates to his O.G. Rain Water Spouting, which, for lightness, durability, and cheapness, cannot be equalled. 4 inch, at 1*s.* 1*d.* per yard; 4½ inch, 1*s.* 2¾*d* per yard; 5 inch, 1*s.* 5*d.* per yard.

Wire Working, Sheep Fencing and Hurdles, at reasonable prices. Garden Implements of every description.

N.B. To be Sold, a bargain, a Large Wire Aviary.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	*s.*	*d.*
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water: Fire Engines, &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

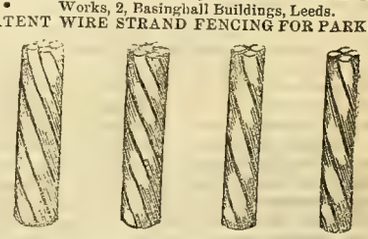
HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 30 per cent. which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who, on application, will forward wholesale and retail prices.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS Millbank Street, Westminster.

LINSEED AND CORN CRUSHING MILLS.

E. R. AND F. TURNER, St. Peter's Iron Works, Ipswich, have, during the present season, obtained the Prizes of the Royal Agricultural Society at Lincoln, the Bath and West of England Society at Bath, and the Yorkshire Agricultural Society at Ripon, for their celebrated ROLLER MILLS for Crushing Corn, Seeds, &c. These are manufactured of various sizes, particulars of which, with Illustrated Catalogue of Steam Engines, new Prize Chaff Cutter, and a variety of other Implements, manufactured by E. R. & F. TURNER, may be had free on application at the Works, Ipswich, or by Post, inclosing two postage stamps.

M'GLASHEN'S PATENT TRANSPLANTING APPARATUS.

MR. M'GLASHEN, the Inventor of this Apparatus, has to express his regret that delay has hitherto occurred in the execution of orders, from causes over which he had no control. He begs to state that he has now taken entirely into his own hands the Manufacture and Sale of the Apparatus, and that orders will henceforth receive punctual attention.

The Apparatus is suited for Raising and Removing to any distance Trees, Shrubs, and Flowers, of all sizes, with attached Balls of Earth, so that the operation is not only perfectly safe, but does not affect the vigorous growth of the Plants. The use of this Apparatus greatly facilitates planting operations, and saves much labour and expense. The delay that occurred, while to the inventor a cause of regret, afforded him the opportunity of introducing several important improvements, which have served to cheapen the cost of the Apparatus, and increase the facility and security of its use.

Agents will ultimately be appointed throughout the kingdom. In the meantime all orders and other communications are respectfully requested to be addressed to Mr. STEWART M'GLASHEN, Canonmills Bridge, Edinburgh, who will be happy (either personally or by letter) to supply information to Landed Proprietors, Landscape Gardeners, Nurserymen, Foresters, and others.

Canonmills Bridge, Edinburgh, Sept. 1854.

NOTICE TO AGRICULTURAL ENGINEERS.

DRILLING MACHINES of easy and reliable working, being a general want of the present day. The undersigned begs to call attention to his invention, preferable in every respect to the machines now used in England and on the Continent, and which is constructed on an entirely new principle.

The recommendations are:—

I. The mechanism is so simple that it will last very long, and although there are neither brushes nor spoons employed, the adjustment is nevertheless very easily and successfully accomplished.

II. The adjustment for straitening or widening it is not only easily effected, but at once, without the least loss of time, and without any insecurity.

III. It is better fit for drilling corn and seeds of the finest description, as well as for the quantity of seed, depth of furrows, and drilling distance.

IV. It is of a very simple construction, yet lasting and effective.

V. It is much cheaper than anything hitherto invented, the construction costing about half the price of English Drills of the same breadth.

There is also an instrument (called snake) peculiar to this machine for cultivating the space between the drilled seed; and it will stand in about 3/. It may easily be managed after a little practice even by common labourers, and the seed, when drilled at nine or seven inches, may be worked with perfect ease and safety at any depth wished for, and quite as well as it is effected by the expensive English instruments.

Any gentleman desirous of purchasing the invention will please to call upon the inventor, DOMAINEATH SIBETH, Güstrow, Mecklenburgh-Schwerin, Germany, six hours' distance from Hamburgh by railway, where the Improved Drilling Machine may be tried, and the purchase effected.

Güstrow, F. G. SIBETH.

Mecklenburg-Schwerin, Germany, Sept. 1854.

CARSON'S ORIGINAL ANTI-CORROSION PAINT,

specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS SLATES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See Gardeners' Chronicle first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

Squares	6 by 4 and 6½ by 4½	... ...	13 6

JAMES PHILLIPS & Co.,

116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

ENCAUSTIC TILE PAVEMENTS.

MAW AND CO., Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "THE SUCCESSFUL IMITATION OF OPY'S ALEXANDRINUM, IN THE BEAUTIFUL ENCAUSTIC TILE PAVIMENT OF CLOISTERS OF BYZANTINE COURT," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.

Specimens at 11, Aldersgate Street, City.

"FRIGI DOMO."

—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

SUBSTITUTE FOR GARDEN MATS.—Waxed

Sheeting nearly 2 yards wide, 1*s.* per yard run—admits light and excludes cold; thick Canvas Tarpaulling, 1*s.* per square yard; thick Canvas Waxed Sheeting, 1*s.* per square yard, may be had various widths. These Canvases are excellent for roofing Sheds and Outhouses, as they are quite waterproof.—R. RICHARDSON, 21, Tonbridge Place, Judd Street, New Road, London. N.B. Waterproof Capes, large size, 3*s.*; Police Capes, 18*s.* and 24*s.* per dozen; Driving Aprons, Capes, and Coats of India Rubber, Horse's Loin Cloths, Waggon and Cart Covers, Sacks, &c.

GARDEN NETS, FISHING NETS, SHEEP

NETS, AND RABBIT NETS, made by Machinery, and supplied at very low terms. Samples sent free.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

WIRE FENCING, 6¾*d.* per square yard, in various

widths, from 6 feet to 15 inches, mesh less than 2 inches. An effectual fence against Hares, Rabbits, Sheep, Deer, &c., and for the enclosure of Poultry, Pheasants, &c. 4-inch mesh, 4*d.* per square yard.

R. RICHARDSON, 21, Tonbridge Place, New Road, London.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.

—PROPRIETARY ARTICLES. — METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130*B* and 131, Oxford Street, second and third doors west from Holles Street.

FENDERS, STOVES, AND FIRE-IRONS.—

Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

THE PERFECT SUBSTITUTE for SILVER.—

The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

For instance, Dressing-cases at 25s., or at 150l.; Penknives at 1s. or 21s.; Tooth Brushes at 6d. or 2s., each article being good of its sort. Mr. MECHI'S Assistants at the Crystal Palace will attend constantly to receive orders and dispose of his manufactures there.—4, Leadenhall Street, Sept 23.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling of, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2s. per Package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of Moustachios." H. ADAMS.—"It has prevented my Hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." MRS. ELDER.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, MOUSTACHES, &c.?—ALICE MELVILLE'S PALMAPILLA in all cases strengthens weak hair, prevents its falling off, checks greyness, produces a thick and luxuriant growth, dispels scurf and dandriff, and makes it clean, soft, curly, and brilliant in appearance. For baldness from any cause it is certain and effective; and for the production of Whiskers, Moustaches, Eyebrows, &c., in three or four weeks, it can be fully depended upon. Price 2s. 6d., sent post free (anywhere) on receipt of 30 penny postage stamps, by Miss MELVILLE, 25, Argyle Square, King's Cross, London. —"My whiskers are growing very thick." R. Mede, Esq. —"It restored my hair, which I had lost in patches." W. Sturt.—"It has quite checked the greyness." Miss Ellis.—"My Moustache is greatly improved." Capt. Ross.

NERVES.

DR. GRANDISON'S PILLS for strengthening the Nerves are sold in London by Mr. RICHARDS, 40, New Bridge Street; Mr. SANGER, 150, Oxford Street, and other respectable Chemists. Boxes can be sent by post.—Price 1s. 1½d., 2s. 9d., and 4s. 6d. each.

PARR'S LIFE PILLS.

THE English public have, by the test of experience, become satisfied that PARR'S LIFE PILLS are composed of simple but powerfully curative ingredients. They are so mild and excellent in their action that a child may take them. For Bilious Disorders, Liver Complaints, Indigestion, Costiveness, Sick Headache, Depression of Spirits, Pains in the Back, Gravel, and Lumbago, PARR'S LIFE PILLS will be found a safe and admirable remedy. Invalids should make an immediate trial of this excellent, long-tried, and successful medicine.

TO LADIES.

PARR'S LIFE PILLS are especially efficacious in all the variety of ailments incidental to the fair sex. Ladies, even of the most delicate constitutions, will find them particularly beneficial both before and after confinement; and, for general use in schools, they cannot be too strongly recommended. They mildly and speedily remove all skin eruptions, sallowness of complexion, nervous irritability, sick headache, depression of spirits, irregularity, or general derangement of the system.

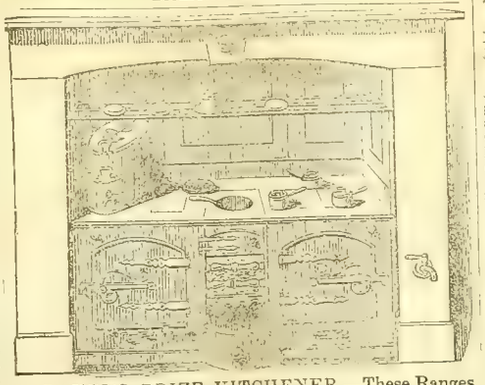
Observe the signature of the proprietors, "T. ROBERTS & Co., Crane Court, Fleet Street, London," on the directions. Sold in boxes at 1s. 1½d., 2s. 9d., and family packets at 11s. each, by all respectable chemists and medicine vendors in town and country. Full directions are given with each box.
☞ Be sure to ask for PARR'S LIFE PILLS.

HOLLOWAY'S OINTMENT AND PILLS WONDERFUL REMEDIES FOR THE CURE OF BAD LEGS.—Mr. Slater, of Stone, states in a letter to Professor HOLLOWAY, that he has seen many cures effected by his invaluable Ointment and Pills, one in particular he mentions as most extraordinary, that of a stonemason, working on the new Catholic chapel in that town, whose foot and ankle were one complete mass of sores, the worst he ever beheld, but by the application of the remedies for a short time it was really astonishing to see the rapid cure these valuable medicines perfected, as his foot is soundly and permanently healed.—Sold by all vendors of medicine, and at Professor HOLLOWAY'S Establishments, 244, Strand, London; and 80, Maiden Lane, New York.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1s. 1½d. per box.—Observe that "THOMAS PROUT" is on the Government stamp.

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1s. 1½d. and 2s. 9d. per box.—Mr. William Courtney, of Barton Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon on suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp.

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge.
ESTABLISHED A.D. 1700.



FLAVEL'S PRIZE KITCHENER.—These Ranges are strongly recommended for their simplicity of construction and their economy and cleanliness in use. The top forms a Hot-plate, and the open fire removes many of the objections which are felt to close Ranges. They are made in all sizes, from 3 feet to 18 feet in width, suitable for large or small establishments. They are admirably adapted for the Cure of Smoky Chimneys. London agency removed to Wigmore Street, from 92, Jermyn Street, Piccadilly. BENHAM & SONS, 19, Wigmore Street, London. And in the Hardware Court of the Crystal Palace, Sydenham.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last 11 years, and is applicable to every kind of single and double Rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7s. 6d. in postage stamps, cash, or Post-office order, payable at the General Post-office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 3 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

DEAFNESS, NOISES IN THE HEAD AND EARS, &c.

DR. BARKER'S remedy restores hearing in ALL cases, however it may have been lost—removes all those harassing noises in the head and ears, arising from cold, nervousness, &c.—checks discharges—and allays pain and earache. Sent post free to any part of the kingdom, with full instructions for use, on receipt of 7s. 6d. in penny postage stamps, or by post-office order (payable at the General Post Office), by ALFRED BARKER, M.D., 25, Argyle Square, King's Cross, London. Consultation hours, 11 till 3 daily, except Sundays.
A TREATISE ON DEAFNESS, 68 pages, with a host of cases, testimonials, &c., sent post free for 8 penny stamps. Dr. B.'s treatment cured 3970 cases in 1853, many of which had been tampered with by the various quacks and impostors who profess to cure deafness.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

WANTED, a SMALL NURSERY, near London, or any of the large provincial towns.—S., Post-office, Stratford, Essex.

NURSERY AND SEED BUSINESS.
ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the old-established NURSERY and SEED TRADE at Taunton, Somerset, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required, the quantity of ground may be reduced. The Nursery is five minutes' walk from the Railway Station.—For further particulars, apply to Mr. M'INTOSH, the Nurseries, Taunton; or to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

ALTHORNE, ESSEX.

TO BE LET, on Lease, from Michaelmas next, the STOKES HALL ESTATE, containing about 370 acres of excellent Arable and Pasture Land, in a high state of cultivation, with Gentlemanly Residence, suitable Farm Buildings, Cottages, Wharf, &c., pleasantly situated on the River Crouch, and within 3 miles of the Port of Burnham, and 8 miles of the market town and Port of Maldon.—Further particulars may be obtained from Mr. WILLIAM WIX, Clerk of St. Bartholomew's Hospital; or from Mr. TATHAM, Land-Surveyor, 27, Bedford Place, Russell Square, London. References will be required.
St. Bartholomew's Hospital, Sept. 23. WILLIAM WIX, Clerk.

TO BE LET, together or separately, a FARM of 200 acres, with a comfortable Residence, situate one mile from a Railway Station near Shrewsbury. The Mill, with House and 20 acres, adjoin the above.—Apply to J. P., Post Office, Shrewsbury.

TO MARKET GARDENERS.

TO BE LET, ON LEASE, about Thirty-six ACRES of LAND (or a part of it), situate in the Parish of Beddington, near Croydon, Surrey, a considerable portion of which is well Cropped, abundantly stocked with Fruit Trees, and in a high state of cultivation. The Stock, Crops, and Sheds standing upon the premises are to be taken at a valuation, and possession will be given on September 29.—For particulars, apply to Messrs. DRUMMONDS & Co., Solicitors, and Messrs. BLAKE, Auctioneers, Croydon; to Mr. J. BATCHELOR, Market Gardener, Waddon; to Mr. COLLYER, Beddington; or to MR. A. A. COLLYER, Solicitor, 4, Bedford Row, London.

SPANIELS.

WANTED, a Brace of well-broken SPANIELS, two years old.—Address, stating price and colour, Beta, *Gardeners' Chronicle* Office, London.

TO BE DISPOSED OF, Six CYGNETS in very fine condition, and of good size.—Apply to H. T. HUMPHREYS, Kilmacow, Waterford.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting. Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. FOX'S, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

POPULAR WORKS ON BOTANY BY DR. LINDLEY.

SCHOOL BOTANY; OR, THE RUDIMENTS OF BOTANICAL SCIENCE.

400 Illustrations. 8vo. Price 5*s.* 6*d.* half-bound.

BRADBURY & EVANS, 11, Bouverie Street.

Lately Published,

THE ELEMENTS OF BOTANY. STRUCTURAL AND PHYSIOLOGICAL. With a Glossary of Technical Terms, and numerous Illustrations. 12*s.* cloth.

This completes the series of Elementary Botanical Works by Professor LINDLEY, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

The first two Parts of THE ELEMENTS OF BOTANY, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12*s.*

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

N.B. The Glossary may be had separately, price 5*s.*

BRADBURY & EVANS, 11, Bouverie Street.

This day is published, in one vol. 8vo, with numerous woodcuts, price 14*s.*,

MEDICAL AND ŒCONOMICAL BOTANY; or An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

BRADBURY & EVANS, 11, Bouverie Street.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Notice is hereby given that an ELECTION of TWO PENSIONERS on the Funds of this Charity will take place in January next. All persons desirous of becoming Candidates at such Election are requested to send in their petitions and testimonials to the Committee on or before the 1st November next, after which time they will not be received.

Printed forms of petition can be had upon application to the Secretary. By order of the Committee.

7th October, E. R. CUTLER, Secretary.
14, Tavistock Row, Covent Garden.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER'S descriptive List of the above splendid flowers, containing hints on their culture, and observations on exhibiting, &c., is now ready, and may be had on application, by forwarding one postage stamp.—Saffron Walden Nursery, Oct. 7.

PINE PLANTS.

WILLIAM OLIVER has a few strong, clean, and healthy PINE PLANTS of the famous winter sorts—the Montserrats, Black Jamaica, &c.—to dispose of. Price, &c., on application.—Combe Gardens, near Coventry, Oct. 7.

PRIMULA SINENSIS.

J. AND J. HAYES begs to offer their fine fringed varieties of Red and White PRIMULAS; fine strong plants, in 60-sized pots, ready for shifting, at 6s. per dozen, packing and carriage included, to any railway in London. All orders from unknown correspondents to be accompanied with a Post Office order, payable to J. & J. HAYES, Edmonton, Middlesex.

HOLLYHOCK SEED.

WILLIAM CHATER begs to offer packets of the above Seed, containing twenty sorts, selected from his best show varieties, at 5s.; 12 varieties, do., 2s. 6d.; and from good double border sorts, at 1s.—Also Pansy Seed, from the best flowers, 2s. 6d. per packet.—Strong Plants of the new Double Crimson Rocket, excellent bedding plants for spring flowering, 6s. per dozen, or 2l. per 100; Double French White, 4s. per doz., or 30s. per 100.—Saffron Walden, October 7.

THOMAS JACKSON AND SON, having a large healthy Stock of STOVE, ORCHIDACEOUS, and GREENHOUSE PLANTS, respectfully invite intending purchasers to an inspection; in addition to the established favourite kinds will be found many novelties now offered at very low prices.

Kingston, near London.

PERUVIAN BARLEY, FOR AUTUMN OR SPRING SOWING.—A packet of this prolific, skinless, hardy, heavy, and very early variety of Barley, sufficient to sow one rod of ground at six inches apart square, will be sent to any address, post free, on receipt of eight postage stamps, warranted genuine and selected grains, from ABRAHAM HARDY & SON, Seed Growers and Seedsmen, Maldon, Essex.

R. SMITH is now sending out his New Seedling Strawberry, SIR CHARLES NAPIER, the best forcing one of the day, admired by all who have seen its growth, and for colour not one to equal it.—Price, 3l. per 100; 50 for 30s.; 25 for 1l.

R. SMITH, Market Gardener, Richmond Road, Twickenham; or G. GLADMAN, Salesman, Covent Garden Market, London.

CHRYSANTHEMUMS.

R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's selection at 9s. per dozen.

CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4s. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9s. per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12s. per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for GERANIUMS (show and fancy), FRENCH GERANIUMS, FUCHSIAS, VERBENAS, FAIRY ROSES, CHRYSANTHEMUMS, HELIOTROPES, CINERARIAS, CALCEOLARIAS, PRIMULAS, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

For further particulars, see Advertisement in last week's *Chronicle*. Catalogues forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth

SUTTON'S AUTUMN CATALOGUE is now published, and will be sent post-free on receipt of one penny stamp.—Address SUTTON and SONS, Reading, Berks.

RARE AND HARDY CONIFERS.—A detailed List, with prices of the most Hardy and Ornamental Conifers, suitable for planting on the sea coast and other exposed situations, will be found in YOUELL AND CO.'s Advertisement of Sept. 9.

Royal Nursery, Great Yarmouth.

THE PAST WINTER AND SPRING have induced YOUELL & Co. to publish a CATALOGUE of RARE and HARDY CONIFERS and HARDY ORNAMENTAL SHRUBS, that have proved with them perfectly hardy in this well-known bleak district, exposed to the cutting winds from the North Sea.

This Catalogue also contains an extensive selection of the most useful Greenhouse Plants, Camellias, Ericas, Epacris, Chrysanthemums, Hollyhocks, Tree Carnations, Carnations and Picotees, Fuchsias, Verbenas, Phloxes, &c., which will be forwarded (stamped) on receipt of two postage stamps.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

ROSES.

THE DESCRIPTIVE CATALOGUE OF ROSES for the Season, by THOS. RIVERS, is now ready for delivery, and will be sent on application for two postage stamps. A choice selection of varieties only is inserted, so that it forms a useful guide to the Amateur.—Nurseries, Sawbridgeworth, Herts.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

DUTCH BULBS.

THOMAS CRIPPS, NURSERYMAN, SEEDSMAN, and FLORIST, respectfully announces that his annual importation of the above has just arrived in excellent condition, Catalogues of which, comprising, amongst others, many new and choice varieties of Hyacinth, Crocus, Tulips, Anemones, &c., may be had on application.—Tunbridge Wells, Oct. 7.

GEORGE JACKMAN begs to announce that he has just published a new and complete CATALOGUE of his Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.

Woking Nursery, 1½ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—Oct. 7.

JOHN SCHOFIELD AND SON beg respectfully to inform their Friends and the Public that their AUTUMN CATALOGUE of Carnations, Picotees, Pinks, Pansies, Hollyhocks, &c., is now ready, and may be had on application, free.

N.B. Pansy Seed, selected from the finest show flowers, 2s. 6d. per packet; also a few packets of extra fine Calceolaria Seed 2s. 6d. each.—Knowsthorpe, near Leeds, Yorkshire.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, respectfully informs his friends and the floricultural public that his priced and descriptive CATALOGUE of FLORISTS' FLOWERS, &c., is now ready, and will be forwarded on application, enclosing a postage stamp.

Selected Pansy Seed, 1s. and 2s. per packet.

J. H., having a large surplus stock of the older varieties of SHOW TULIPS, he will dispose of them at 20s. per 100, strong blooming bulbs.

The FLUKE POTATO for seed, 5s. per bushel.

AMERICAN NURSERY.

GEORGE BAKER'S Descriptive CATALOGUE of AMERICAN PLANTS, Coniferæ, Ornamental Shrubs, Fruit and Forest Trees, &c., may be had by enclosing two postage stamps.

G. B. wishes to call particular attention to his fine Stock of Weeping Hollies, from 3 to 10 feet high.

American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, Windsor Branch South Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

DUTCH FLOWER ROOTS.

WILLIAM E. RENDLE & Co., SEED MERCHANTS, Plymouth, have just received, direct from one of the first establishments in Holland, a very large assortment of

DUTCH FLOWER ROOTS,

comprising all the best varieties of Hyacinths, Tulips, Ranunculuses, Anemones, Gladiolus, Iris, Liliums, Crocus, Ixias, and all other kinds of Flowering Bulbs.

They are all come to hand in most excellent condition, and will insure satisfaction to all purchasers.

COLLECTIONS OF FLOWERING BULBS.

No. 1. A Selection of all the most approved sorts for a large garden £3 0 0
No. 2. A Selection, in smaller quantities 2 0 0
No. 3. A Selection, for a small garden 1 0 0

These Collections have given the greatest satisfaction to all who have had them, and can be recommended with the greatest confidence.

All Orders for Roots above 2l. Carriage paid to any station on the South and Western Railways, and above 5l. to any station in England.

STRAWBERRIES.—*This is the best time for planting Strawberries, especially after the late rains we have had. The Subscribers have a very superior stock of the following choice varieties:—*

INGRAM'S PRINCE OF WALES.—The principal sort grown at Frogmore for the Royal table, 20s. per 100.
PINCE'S NIMROD—highly recommended by Lucombe, Pince, & Co., 40s. per 100.
NICHOLSON'S AJAX ... ... } Four excellent varieties, fully described by Mr. Nicholson. Price 7s.6d. per 100.
" RUBY ... ... }
" CAPTAIN COOK }
" FILLBASKET ... }
TROLLOPE'S VICTORIA—A very superior and most prolific variety, 5s. per 100.
CUTHILL'S BLACK PRINCE—5s. per 100.
KITLEY'S GOLIATH—5s. per 100.

All the other choice varieties in cultivation. For prices and further particulars, consult RENDLE'S NEW AUTUMNAL CATALOGUE, *just out, to be had in exchange for two penny stamps.*—Apply to

WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth.

DUTCH HYACINTHS, for Forcing, single and double, at 4s. per dozen. Also Narcissi, Crocuses, Tulips, Irises, Jonquils, Anemones, and Ranunculuses, priced Catalogues of which will be forwarded by post, from ARTHUR COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall.

Also Double Roman and Paper White Narcissus, the most beautiful and fragrant of all the Narcissi, 4s. per dozen.

TO THE AGRICULTURISTS OF ENGLAND.

HARRADINE'S "NE PLUS ULTRA" WHEAT.—A single ear of this wonderful Wheat, which was purchased, five years ago, of a soldier on tramp, who brought it from some distant country, was sown in 1849; the produce of this was again sown in 1850, and also in 1851, when it yielded at the rate of 19 coombs 1 bushel and 1 peck per acre. This induced me to continue its cultivation, and I have now in my possession one root, the produce of one kernel, having upon it 25 full grown ears, and numbering over 2000 kernels. This extraordinary root, together with a sheaf and a quantity of corn, will be shown at Mechi's Stand, in the Crystal Palace, by which its quality and general character may be seen.

The following gentlemen kindly lent me portions of their land last season to test the producing quality of the Wheat, and up to this year not one kernel has been sold for seed. The quantity sown on all the varieties of soil has in no instance exceeded 4 pecks per acre.

On land of Mr. Wasdale, in the parish of Woodhurst, this Wheat was sown after Tartarian Oats, Clover, Seeds, Peas, and Tares (some being sown in February, and equally productive).

On land in the occupation of Mr. Gadsby, in the parish of Godmanchester, 1 acre, the yield of which has been 30 per cent. over his own Wheat, grown in the same field, and has been tested by several agriculturists of the neighbourhood.

On land in my own possession, in Needingworth, and other places (both fen and highland), it has been sown after Wheat, Clover, Barley, Beans, Oats, and fallow, and in every instance has been most productive.

I am prepared to part with a limited quantity, which can be had on application to me, at 25s. a bushel. All orders to be accompanied by a remittance.

JOHN THANG HARRADINE, Needingworth, St. Ives, Huntingdonshire.

THE PERPETUAL TREE VIOLET, or DOUBLE VIOLA ARBOREA.—The original grower of this, the true variety of the above beautiful Violet, now offers it to the public; it has surpassed all others, and now stands without an equal for its size of flowers, fragrance, and perpetual blooming; and as a plant for the Conservatory or Greenhouse, nothing can equal it. Large plants, 6s. per dozen; smaller ditto, 3s.

DOUBLE WHITE TREE VIOLET.—This is also a fine variety, and resembles the other in many respects, with the exception of its colour. The stock of this is small, in consequence of the great demand for it last season: parties requiring plants should not delay their orders. 6s. per dozen.

THE RUSSIAN SUPERB VIOLET.—One of the finest of single Violets, large blooms, with long stems, and most delightful fragrance; will bloom well through the season if sheltered from the heavy rains and severe frosts during the dead of winter. Plants 3s. per dozen.

A TREATISE on the best and most effectual mode of cultivating the VIOLET, post free for 12 stamps, or sent gratis with all orders above 5s.

GIANT SCARLET BROMPTON STOCK plants are now ready for planting out; the spikes of flower are very large, (measuring from 18 to 24 inches in length) and so fragrant that they are admired by all who have seen them. Fine strong plants, 6d. per dozen, or 4s. per 100.

STRAWBERRY PLANTS.—Good strong plants of the following superb varieties can be supplied:—Nimrod, 10s. per 100; Prince of Wales, 10s. do.; Ajax, 5s. do.; Ruby, 5s.; Myatt's Eleanor, 3s. do.; British Queen (true), 3s. do.; Black Prince, 3s. do.; Cremont's Perpetual, 3s. do.; Victoria, 5s. do.; Surprize, 3s. do.; and a great number of other good old varieties, at 3s. per 100.

POLYANTHUS SEED, saved from the best laced varieties, 1s. per packet.

ANTIRRHINUM SEED, all saved from the best named varieties, 1s. per packet.

EXTRA FINE SWEET WILLIAM SEED, saved from all the best and most beautiful varieties, 1s. per packet.

VERY SUPERIOR WELL RIPENED HOLLYHOCK SEED, 1s. per packet.

LORD KEYNON'S FAVOURITE CUCUMBER is the best and most productive for winter cultivation ever grown, requiring less heat than any other of the kind. It is a very handsome fruit and free setter. Good old seed of the above true variety may be had, price 2s. 6d. per packet.

The Violets and Seeds will be sent postage free, but the Strawberry Plants and Stocks will be sent by hamper, package free.

Any of the above will be forwarded on receipt of Post Office Order, or Penny Postage Stamps, for the amount by

EDWARD TILLY, Nurseryman, Seedsman, & Florist, 14, Abbey Churchyard, Bath, Somersetshire.

DUTCH FLOWER ROOTS.

PETER LAWSON AND SON, of Edinburgh, Seedsmen and Nurserymen to the Queen, beg respectfully to acquaint their customers and the Public that they have now opened a place of business in London for the convenience of their English correspondents, and will be prepared to execute orders of every description there. They have just received a supply of DUTCH FLOWER ROOTS, consisting of all the esteemed varieties, of which Catalogues may be had on application, and for which they solicit early orders.

London, 27, Great George Street, Westminster, Oct 7.

VERY FINE ANEMONE ROOTS AND SEEDS.

TO THE NOBILITY, GENTRY, AND CLERGY.

HENRY GIBSON, Florer, near Weedon, Northamptonshire, has now on Sale an unlimited Stock of the finest Striped and other ANEMONE ROOTS, at the following low prices, viz.:—

Selected, all Striped, 10s. per 100, or 4l. 10s. per 1000.

A splendid Collection of Mixed at 3s. 6d. p. 100, or 1l. 10s. p. 1000.

Packets of Seed, saved from all the choicest of the Flowers, containing 2000 seeds, 2s. each. Sent free of carriage to all parts of England on receipt of a post-office order, on the Weedon Post-office, payable to HENRY GIBSON.

Orders to the amount of 5s. can be forwarded in postage stamps.

N.B. Allowed by competent judges to be the best Collection in England.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity: and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2d. stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

NEW HARDY CONIFERS.

HUGH LOW AND CO. announce to their friends and the public that they have been appointed by Messrs. Parsons & Co., of Flushing, New York, Sole Agents in this country for the sale of the undernamed CALIFORNIAN CONIFERS. The Plants are raised from seed, and will be delivered as soon as the growth of the present season is sufficiently matured. THUJA GIGANTEA (Nuttall; *synonyms* LIBOCEDRUS DECURRENS (Torrey); THUJA MENZIESI (Douglas); THUJA CRAIGIANA (Jeffreys).—A magnificent species, and the most desirable Tree known to exist in California. It was discovered by the botanists of the United States Exploring Expedition, and is described by Professor Torrey, in "Plantæ Fremontianæ," as growing near the upper waters of the Sacramento, from lat. 38° 40 to 41° N. He also states it is a noble tree, attaining a height of 120 to 140 feet, with a trunk 7 feet in diameter, rising from 80 to 100 feet without a limb. This tree will be perfectly hardy, and will take the foremost rank amongst our ornamental trees, as the foliage is most beautiful, reminding an observer of some of the more graceful species of Lycopodium.

The Plants when delivered will average 1 foot to 1½ feet in height, and being of such unusual size for a new Conifer, will produce an immediate effect. Price 31s. 6d. each.

ABIES NOBILIS.—This well-known Fir requires no description. Plants from seed have long been desiderata, and those now offered are strong and well shaped, from 6 inches to 1 foot in height. Price 31s. 6d. each.

In addition to the above, H. L. & Co. have to offer from the same source strong Plants of several species of Lady CALIFORNIAN PINES, collected in districts little explored. Amongst them will be found Pinus Jeffreyana, Pinus Parryana, offered for the first time; and judging from the CONES of the different species, it may with certainty be inferred that several others will prove entirely new to this country. Price 84s. per doz.

Messrs. Parsons & Co. having been successful in raising these fine Conifers in considerable numbers, have determined on offering them at the low prices quoted above, with a view to insure their speedy introduction into every collection in Europe.

Discount allowed only when twelve plants of a sort are taken.

Clapton Nursery, London, Oct. 7.

NORTHGATE NURSERY, CHICHESTER.

JAMES GRAHAM, late Gardener and Steward to Mrs. Smith, Bersted Lodge, Bognor, begs most respectfully to announce to the Nobility, Clergy, and Gentry, and to the public generally that he has succeeded to the long established NURSERY and GARDEN SEED BUSINESS of Messrs. SILVERLOCK and SON. J. G. trusts that by constant personal attention, and from his experience in the practice of Horticulture, as well as from his being well known in the neighbourhood, he may venture to solicit a continuance of the patronage and support so long bestowed on his predecessors.—Oct. 7.

NURSERY STOCK TO BE DISPOSED OF.

PETER BOOTH, NURSERYMAN, Falkirk, wishes to retire from business, and would give a Lease of all his Nursery Grounds, which belong to himself, to a person wishing to pursue that line of business. These grounds are cropped with a most excellent, healthy, and general stock of Nursery Plants, of which a good bargain could be got, and the good-will of the business, which has been carried on in a very favourable locality, formerly by his relatives and latterly by himself, for more than 70 years past, and with great success.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 11s. per ton; ditto, delivered 5 miles, 16s. per ton. Loam and Peat at moderate prices.—KENNARD BROTHERS, Swan Place, Old Kent Road, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

HETLEY AND CO. are supplying 16-oz. Sheet Glass of British Manufacture, packed in boxes, containing 100 square feet each, at the following REDUCED PRICES for cash. A reduction made on 1000 feet.

Sizes.—Inches.	Under 6 by 4	at	1½d.	is	£0 12 6

8 " 6 " 8½ " 6½	...	...	...	13 6 "
9 " 7 " 9½ " 7½ and 10 by 8	...	...	...	15 0 "

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2s. each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,
116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

GLASS.

THOMAS MILLINGTON, Importer of Foreign Sheet Glass, requests attention to the present Prices of Glass and Stock sizes, which are cheaper and better than those of English manufacture:—

T. MILLINGTON, 87, Bishopsgate Street Without, London.

DUTCH BULBS.

GARAWAY, MAYES, AND CO. beg to announce that they are now prepared to execute orders for the above, consisting of Hyacinths, Tulips, Crocus, Narcissus, Anemones, Ranunculus, and all kinds of BULBS for early forcing, which they have carefully selected from the leading growers in Holland. The Roots are unusually fine this season, as well as moderate in price. All orders entrusted to them shall have strict attention, and they feel assured cannot fail to give satisfaction.

G. M. & Co. having for many years flowered annually several hundred Hyacinths, Tulips, &c., have had an opportunity of selecting those flowers only which are most constant and distinct for glass and pot culture.

Good Border Hyacinths, 4s. per dozen; fine named ditto, 6s., 8s., to 12s. per dozen.—Durdham Down Nurseries, Bristol.

WANTED, GRAPES, PINES, AND PEACHES.

Forward immediately to GEORGE TAYLOR, Jun.,
Fruit Salesman,
St. John's Market,
Liverpool.

SWEETWILLIAMS.

"THE most extraordinary movement that has ever taken place in the floral world." Such is Mr. Glenny's opinion of Mr. HUNT'S SWEETWILLIAMS, in the "Horticultural Journal," for July 15, 1854.

The "Florist," for August, in its report of the National Floricultural Society, says, "Mr. BRAGG exhibited a very fine collection of Mr. Hunt's Sweetwilliams, remarkable for form and texture, the petals being stiff, smooth, and well rounded, and varying in colour from white, with carmine centres, to brilliant crimson."

The editor of the "Midland Florist," in the number for August, describes them as "round, smooth on the edge, close in the truss, distinct in colour; in fact, beautiful in the extreme."

See also "Midland Florist," for September, 1853.

In the "Gardeners' Record," for September, 1853, Mr. Neville pronounces them as "large, perfectly smooth, and possessing properties worth the notice of amateur florists, and will, no doubt, if sent out, soon become general favourites."

W. BRAGG, of the Star Nursery, Slough, has much pleasure in informing the admirers of the above new and truly beautiful Flowers, that he is now prepared to send out strong healthy Plants, at 7s. 6d. per dozen.

The usual Allowance to the Trade. A list of those Nurserymen who ordered Plants will be published.

WILLIAMS' EVERGREEN CLIMBING ROSE.

TO BE SENT OUT THE END OF OCTOBER.

WM. WOOD AND SON, of Woodlands Nursery, Maresfield, near Uckfield, Sussex, have been appointed agents for the sale of the above splendid ROSE. This highly interesting and valuable addition to the class of Evergreen Climbing Roses was raised by the late John Williams, Esq., of Pitmaston; it is a seedling from Ayrshire splendens fertilised with Yellow Tea; its rapid growth and elegant habit is precisely like the Ayrshire splendens, while its glossy foliage, and long lemon-coloured buds, partake of the character of the Yellow Tea; its flowers are creamy white, deliciously sweet-scented, and are borne in long racemes of 12 to 20 on a single shoot, being produced from every axil. It is highly desirable for covering Walls, Lattice Work, Verandahs or Buildings of any kind, and as a Pillar Rose is unequalled, being of an extremely elegant habit for forming festoons or arches, and is also very hardy. For Bouquets it is a most beautiful variety, producing an immense number of its finely-formed buds. It only requires to be grown to be pronounced the best Climbing Rose for all purposes in cultivation. Good established plants at 3s. 6d. each, with the usual allowance to the Trade.

WILLIAMS' EVERGREEN CLIMBING ROSE.—This highly interesting and valuable addition to the class of Evergreen Climbing Roses was raised by the late John Williams, Esq., of Pitmaston; it is a seedling from Ayrshire splendens, fertilised with Yellow Tea, its rapid growth and elegant habit is precisely like the Ayrshire Splendens, while its glossy foliage, and long lemon-coloured buds, partake of the character of the Yellow Tea; its flowers are creamy white, deliciously sweet scented, and are borne in long racemes of 12 to 20 on a single shoot, being produced from every axil. FRUIT TREES.

G. C. also begs to state that he has a large stock of Trained Trees, Apricots, Peaches, Nectarines, &c., which are very fine; they being planted on maiden soil, have remarkably fine wood and fibrous roots. Also a fine stock of every description of Evergreens, Coniferæ, &c. &c.

N.B. Catalogues may be had on application at the Nursery, Streatham Place, Brixton Hill, Surrey.—Oct 7.

NOW SENDING OUT
BECK'S NEW PELARGONIUMS.

J. DOBSON AND SON are now sending out strong well established plants (in 4-inch pots) of the NEW GERANIUMS raised by E. Beck, Esq., of Worton Cottage, which they feel great confidence in recommending as first-rate in every respect. Catalogues, with full descriptions and prices, with the prizes they have gained, may be had on application.

A Coloured Plate of CONQUEROR, LAURA, and LYDIA will be forwarded, post free, for 14 stamps.

Good show varieties, from 12s. per dozen.

Woodlands Nursery, Isleworth.

STRAWBERRIES.

WILLIAM NICHOLSON is now sending out strong well-rooted Plants of his four new and distinct Strawberries, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy; RUBY, ditto, a great bearer, and forces well; CAPTAIN COOK, market fruit, large, and a great bearer; FILLBASKET, ditto: 400 Plants of the above sorts for 2l.; 200 do., 1l. 4s.; 100 do., 15s.; 50 do., 10s.; box included. Most of the old and new sorts can be supplied.

*** See Mr. J. W. KINMONT'S remarks on the above Strawberries, printed in No. 31, 1854, page 501, of this Paper.

Post-office Orders, payable at Yarm, Yorkshire, or a cash remittance required with the order.

Egglescliffe, near Yarm, Oct. 7, 1854.

STRAWBERRIES.

BARRATT'S MAGNUM BONUM.—In size, this splendid Strawberry very far surpasses the "British Queen," is an exceedingly heavy cropper, and continues in perfection later than almost any other variety. Its flavour is really delicious, most nearly approaching the true Pine Apple of any kind yet known. Price per 100, 2l. 2s.; per dozen, 6s. Good strong Plants of the above are now ready for sending out by

St. John's Nursery, Wakefield. WM. BARRATT.

N.B. W. B.'s List of 40 kinds of Strawberries may be had gratis. Also his Catalogue of Dutch Roots, Herbaceous Plants, Irises, and Chrysanthemums, may be had on application.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50s.; 50, 30s.; and 25, 16s. Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5s. per 100.

Manor Farm, Deptford, October 7.

GOLIATH STRAWBERRY.—This well tested and excellent variety has now outgrown all the prejudice that has been raised against it, and has fully borne out the high character which was at first given of it; and most, if not all the market gardeners in this neighbourhood, as well as gentlemen, are growing it very extensively. It has proved itself to be the very best in the absence of its parent, the British Queen, or where that variety does not succeed.

A Post-office order for 3s. 6d., or stamps to that amount, will secure 100 strong well-rooted plants, package included; or 1s. 6d. for six plants, by post, to any part of the kingdom. Also Trollope's Victoria, the very best for forcing, 3s. 6d. per 100.

Also the following varieties at 2s 6d. per 100:—British Queen, Black Prince, Eleanor, Keens' Seedling, Elton Pine, Myatt's Surprise, Comte de Paris, and Hooper's Seedling.

JAMES KITLEY, Lyncombe Vale Nursery, Bath.

NEW CLIMBING HYBRID PERPETUAL ROSE, THE "DUCHESS OF NORFOLK."—Colour, Vivid Crimson.

To be sent out for the first time about the end of October.

WILLIAM WOOD AND SON beg to refer to their advertisement in the *Gardeners' Chronicle* of September 30, page 627. Standards, half-standards, or dwarfs, will be supplied at 10s. 6d. each, with the usual allowance to the trade.

N B. When six plants or more are ordered by the trade, a very considerable reduction will be made beyond the usual discount, particulars of which may be had on application.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

COLLECTIONS OF DUTCH FLOWER ROOTS.

LUCOMBE, PINCE, AND CO. beg most respectfully to announce that they are now prepared to send out their superior selected collections of the above at the following prices:—No. 1 Collection, containing many very choice varieties of Hyacinths, Narcissus, Tulips, Jonquils, Iris, Crocus, Snowdrops, Anemone, Ranunculus, Ixias, Gladioli, Tigridias, Liliums, Fritillarias, Scillas, Alstrœmeria, and Tritonia, 5l. No. 2, containing the same varieties as the above, in smaller quantities, 3l. No. 3, for a small Garden, containing similar varieties to the above, in smaller quantities, 1l. 10s.—Catalogues and particulars of collections to be had on application at the Exeter Nursery, Exeter.—N.B. No extra charge for package.

NEW GERANIUMS.

ISAAC DAVIES, Larkfield Nursery, Wavertree, near Liverpool, begs to announce that he has now ready for sending out strong healthy plants of the following six Geraniums, being the most distinct and beautiful that could be selected from all exhibited last year:—Regalia, 5s.; Virginia, 3s. 6d.; Pilot, 3s.; Lucy, 3s.; Lady-bird, 3s.; Sanspareil, 3s. Also Ambrose's new Fancy varieties, Duchess of Sutherland, 3s. 6d.; Dandy, 3s. 6d.; Barbette, 2s. 6d., with a fine stock of older varieties. The usual discount to the Trade.

CHOICE NEW GERANIUMS, FUCHSIAS, ETC.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, begs to state that he will be prepared to send out nice plants of Foster's, Hoyle's, Beck's, Dobson's, and Henderson's New Geraniums, sent out last autumn, early in October, well established in 4-inch pots, at 36s. to 40s. per dozen. All the Choice New Fuchsias, sent out last spring, 1s. 6d. to 2s. each, or 18s. per dozen. New Verbenas, sent out in spring, 1s. each, or 9s. per dozen. New Petunias, sent out in spring, 1s. 6d. each, or 15s. per dozen. Choice New Cinerarias, 2s. each, or 18s. per dozen, or 6 for 10s.; older ditto, 6s. to 9s. per dozen. Pansies, newest and best varieties, 18s. per dozen.—Carnations, Picotees, Pinks, &c. &c., equally cheap.

Descriptive Lists of the above may be had for one postage stamp.

NEW PROLIFIC POTATO.

WILLIAM B. JEFFRIES, Arboretum Nurseries, Ipswich, begs to inform his friends and patrons that, owing to the extensive demand for the above-named splendid Potato, he has but very few left; therefore all orders will be executed in strict rotation. Price as before, per peck 3s. 6d., or per bushel 12s. For description see advertisement in the *Gardeners' Chronicle*, Sept. 23d; also for opinion see ditto, August 26, page 552; and *Cottage Gardener*, Sept. 19, page 487.

MAY'S EARLY ASH-LEAVED KIDNEY POTATOES, free from disease, 10s. per bushel, 14s. per cwt., 12l. per ton, sacks included.

EARLY FORTYFOLD POTATOES.—The editor of the *Gardeners' Chronicle* says, "These are a well-known kind, of good quality; a good cropper, and is found by us to be quite as early as the Ash-leaved Kidney, if planted early, escaping all disease, yielding immense crops." They are of the red kind, and round. 8s. per bushel, 11s. per cwt., 9l. per ton, sacks included.

Address, HENRY MAY, The Hope Nurseries, Bedale, Yorkshire.

MESSRS. J. AND H. BROWN offer the following CHOICE PLANTS, which they will forward to any part of the kingdom:—

25 Azaleas, new hardy Belgian varieties on their own roots, with flower-buds, one of a sort by name, 20s.

25 American Azaleas, do. do, 15s.

25 Hardy American Plants, one of a sort by name, 10s. 6d.

12 Hardy Heaths and Kalmias, 6s. [varieties, 12s.

12 Rhododendrons, including Scarlet, White, and Rose, hardy

Fine hardy Scarlet Rhododendrons, 2 feet, 12s. per dozen.

Cedar of Lebanon, 2 to 3 feet, well grown, 12s. to 18s. per dozen.

(Araucaria, Deodara, and Conifers of all kinds, *see List.*)

6 Fine hardy Magnolias, one of a sort, 10s. 6d.

Roses, standards and half-standards, 12s. to 15s. per dozen.

Climbing Roses, of choice sorts, 6s. per dozen.

50 Dwarf Roses, two of a sort, on own roots, 15s.

25 Hardy American Plants, one of a sort, fine plants, 18s.

12 Greenhouse Azaleas, one of a sort, fine plants, 18s.

12 Choice Camellias by name, with buds, 30s.

24 Choice Ericas, one of a sort by name, 16s.

50 Greenhouse Plants, hard-wooded, one of a sort, fine, 45s.

50 Greenhouse Plants, choice species and good plants, 40s.

12 Orchidaceous Plants, choice species and good plants, 40s.

Hyacinths and Dutch Roots of all kinds.

Albion Nursery, Stoke Newington, London.—Oct. 7.

PERMANENT AND LAWN GRASS SEEDS.

WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth, *have a fine stock of* NEW GRASS SEEDS, *and can supply any quantity for present sowing.*

Also new Winter Tares, White Mustard, Trifolium incarnatum, New Italian Rye-grass, &c.

WILLIAM E. RENDLE & Co., Seed Growers, Plymouth.

FINE NEW GERANIUMS, £1 1s. *per dozen.*—*For names of varieties, see* RENDLE'S *New Plant Catalogue, just published.*

Apply to WILLIAM E. RENDLE AND CO., NURSERYMEN and SEED MERCHANTS, Plymouth.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 7, 1854.

A NOTICE was published in our volume for 1853, p. 740, respecting M. ROBOAM'S report to the French Academy of the benefit of bringing Vine branches down to the ground, and we then called the attention of our correspondents to the fact, which appeared from evidence then adduced, not dependent on the contact with the soil but upon the horizontal position; at the same time requesting information, provided any similar experience existed in this country. We have accordingly been favoured with three letters on the subject by Mr. WILLIAM PRESTON, all tending to show that much benefit is to be derived from horizontal training. He has never had a mildewed leaf or fruit on those Vines, some 20 in number, which he has trained horizontally, while the produce has been singularly good. In an adjoining house, however, in which the more ordinary mode of training was adopted,

the Vines have been severely attacked, and when the first evil had been subdued, the disease broke out a second time with equal virulence.

It is not difficult to explain the increased fruitfulness arising from this method of training, which delays the descent of returning sap, to the presence of which, in an unusually concentrated form, the production of fruit is principally due, as is proved by the process of ringing; while the liability of Plums and Apricots to gum, whose branches are trained in a perfectly horizontal direction, depends upon the same abnormal accumulation of sap. This, however, has no necessary connection with the production of the fungi, which, on the contrary, are generally the more prevalent in exact proportion to the luxuriant appearance of a crop. If, for instance, the leaves of a Potato crop present a peculiarly rich green tint, it is almost sure to suffer from mildew, and an attentive search will most probably detect unequivocal signs of the evil, while a crop with a yellowish and apparently sickly appearance will entirely escape. It does not, however, follow that the habits of every parasite should be the same; and inasmuch as it does really appear that Vines in which the branches are horizontal do not suffer, or at least do not suffer so much from mildew, the horizontal method, though it would be unwise to expect any complete exemption from the practice, is well worth the cultivator's consideration, especially when it is considered that on the continent the Vines, which are kept low, without any attempt at horizontal training, suffer far less than those which grow on trellises. *M. J. B.*

We resume our remarks upon the effect of the past winter on Non-Coniferous plants (see p. 595).

Much was hoped from Daphne *Fortuni*, a beautiful species from China, but it can only be now considered as a greenhouse plant; the whole of the Daphnes must, indeed, be regarded as unfit for the winters of this country, except *D. Cneorum*, *pontica*, and *Laureola*.

The Deutzias, with the exception of *crenata*, the young wood of which was cut back near London, seem as hardy as Syringas. There is, however, less evidence as to *D. staminea* than *scabra* and *gracilis*.

Dielytra *spectabilis* requires no further trial; it bears cold as well as a Pæony; but when in full growth and flower, its succulent tender shoots are apt to suffer from the frosts of spring.

Such experience as had been gained respecting the beautiful and graceful *Tikapu*, Dracæna (or Cordyline) *indivisa*, of New Zealand, seemed to justify the expectation that it would endure our winters—at least as far north as London; and this was rendered the more probable in consequence of its forming part of the natural vegetation of Dusky Bay: but the illusion is very effectually dispelled. It is indeed reported to have suffered no injury in Messrs. Veitch's nursery, Exeter; and we can add, from personal observation, that the four graceful specimens decorating the beautiful terrace-gardens at Osborne are also quite safe, although facing the north; but Chiswick, Shiffnal, and Congleton, to say nothing of Ashbourne in Derbyshire, bear witness to the hopelessness of growing it, except in some favoured southern locality.

Duvauas seem to be tolerably hardy; about as much so as a narrow-leaved Phillyrea.

The evidence as to Edwardsias remains unaltered by our present experience; they are hardy enough to be worth training on south walls for the sake of their handsome winter flowers, but their possessors must expect to find their beauty destroyed in every rigorous winter, although their general health may suffer no material injury.

Of the Mediterranean Heaths, belonging to the arborescent breed, we scarcely know what to say, except that they are not to be depended upon north of London. Even in the south they are injured here and there; and yet even *arborea*, the tenderest of all, experienced no inconvenience in such situations as the north of the Isle of Wight.

The glorious Escallonia *macrantha* must rank in hardiness with the Arbutus and Bay; and like those plants will doubtless be universally cultivated wherever they will stand, even at the risk of what may happen with the thermometer at 4°. After such a summer as this has been, we should expect the plant to be as hardy as a Laurel; because its wood will doubtless have ripened. But when it remains soft, as it is apt to do in consequence of the disposition of the species to grow late, it must necessarily lose the ends of its shoots. Where this occurred last winter, the wood that was ripe still survived and broke freely in the spring. We fear, however, that it cannot be called hardy in the northern counties. Of the other *Escallonias*, *pulverulenta* proved the tenderest, and *montevidensis* the hardiest; *rosea* and its varieties are about as hardy as a Gum Cistus.

From what we have now learned, it is certain that experiments with the New Holland Gum Trees (Eucalypti) should be multiplied in every direction. It is true that *E. robusta*, *globulus*, and others, have generally perished; but they are among the tenderer kinds, and even *globulus* is growing unharmed on the terrace at Osborne. On the other hand, *E. coccifera* can scarcely be said to have felt the cold against a south wall in the garden of the Horticultural Society, and there are many that exist in a wild state in still colder stations. Among these are some that the gold diggers of Mount Alexander might easily send home from the Australian Alps. We venture to prophecy that *E. alpina*, for instance, found by Sir T. Mitchell on the summit of Mount William, will be as hardy as a Holly.

Eugenia Ugni, of which we subjoin a sketch, is apparently as hardy as a Myrtle, and, considering its great value as a fruit-bearing bush, deserves special mention. What experience has been gained about it amounts to this, that it was unhurt against a north-west wall, at Exeter, by the winter frost, though injured by the sudden fall of temperature in April; we also know that it is nearly allied to the common Myrtle, and that it is found wild on the hills near Valparaiso, as well as in Chiloe. Were it merely as an ornamental bush we should have

passed it by without special notice, although its graceful habit, fine evergreen leaves, and numerous delicate blush flowers, render it no mean decoration of a garden. But it is the fruit of the species which gives it its true value; this consists of a jet black delicate juicy berry, as large as a black Currant, and produced in the utmost profusion; so that in the private gardens of Valparaiso the plant is grown as a common article of dessert, and is highly esteemed; as it well may be, for it is no exaggeration to say that it ranks in merit with the Peach and Greengage Plum. Upon this point, however, we shall have more to say hereafter. Mention is made of it now with reference merely to its power of resisting cold.

With the exception of Euonymus *japonicus*, all the recently introduced species of that genus prove too tender for general use, and must be regarded as suitable to the south and west alone.

As to Fabiana *imbricata*, what we have seen of it leads us to believe that it perishes from dryness of the air rather than from cold; for even in the most favourable stations, temperature alone being regarded, it dies, while in gardens near London a very little shelter suffices to preserve it. More experience is however wanted as to this.

That Fagus *Cunninghami*, the beautiful little Van Diemen's Land Evergreen Beech, is hardy up to the latitude of London we now hold to be perfectly well ascertained, for although it is returned from Kew as killed to the ground, we are inclined to suppose that the instance alluded to was owing to some local accident, or to its roots having been within reach of water. In the report upon which these notes are founded it is said that behind a heap of stones at Acton Green, a very low situation in heavy clay, but in a position a little raised above the ground, it was hurt to the level of the stones, though uninjured below. We are now in a position to say that the "hurt" alluded to proved to be confined to the leaves, and that the shoots themselves produced new branches as usual.

In another notice we trust to conclude these observations; and then we shall address ourselves to the remarks upon them with which our correspondents shall have kindly favoured us.

VEGETABLE PATHOLOGY.—No. XL.

176. A great deal has been said incidentally, in the course of these observations, on the chemical constitution of plants, and it would clearly be useless to go again over the same ground. It will be sufficient in this place, therefore, to make a few general remarks, such as are necessary to be borne in mind, in considerations respecting the diseases to which the vegetable world is subject. The products peculiar to different natural orders, and even particular species of plants, are almost infinite, new varieties being added to the list of recorded substances every day. Till a very recent period all that could be done, in the then state of organic chemistry, was to give such matters a distinctive name, without any attempt at elucidating their mutual relations, even if some approach were made to their composition. Within the last five years, however, owing to the discoveries of Wurtz (previously predicted by Liebig), Hoffman, and others, the subject has assumed the form of a science properly so called, consisting of a vast variety of details, and resting upon fixed principles. It is unnecessary to refer more particularly to this subject here, which is one of extreme difficulty, though it is very possible that morbid phenomena, at present inexplicable, may hereafter derive much light from an improved knowledge of the mode in which peculiar compounds are generated.*

177. Plants are mainly composed of matters belonging to two great series: the one being combinations of carbon, oxygen, and hydrogen; the other of the same elements, with the addition of nitrogen and sulphur. The walls of the cells in their various conditions are ternary modifications of a common substance, when free from nitrogenous matter, which may have been taken up by them, as water in a sponge; while their contents in a fluid state are nitrogenised, and either give birth to nitrogenous matters, or contain ternary substances like starch, inuline, &c., floating in the fluid, accompanied by various crystallisable salts, which sometimes persist up to the decay of the plant, as though they were not essential parts of it, but deposited from matter which might otherwise have been, if not injurious, at least in a condition unfit for the purposes of vegetation.

178. The members of the first series are specifically sugar, starch, gum, and cellular substance, each of which consists of several varieties, differing slightly in their chemical formulæ, or molecular arrangement, and easily passing into each other. Thus, for instance, cane sugar, starch, gum, and cellulose, are convertible into Grape sugar. If an infusion of malt be mixed with starch, the diastase of the malt—a principle still imperfectly known, but ascertained to be an albuminous or fibrinous body in a state of change—converts the starch into Grape sugar; and it is on this principle, that the starch is converted into sugar during the act of germination, on which the nutriment of the sprouting embryo in great measure depends, and which is again converted into cellulose. In such cases the starch $C_{12}\,H_{10}\,O_{10}$ takes up four equivalents of water, and becomes $C_{12}\,H_{14}\,O_{14}$, or Grape sugar; while $C_{12}\,H_{11}\,O_{11}$, or cane sugar, and $C_{12}\,H_{8}\,O_{8}$, or woody fibre,† similarly become Grape sugar by the assumption respectively of three or six equivalents. So long as the containing membrane is healthy, these matters do not undergo any fermentative process; but when life ceases or is impaired the Grape sugar easily ferments, and in many cases I have detected yeast globules in the fermenting matter, exactly similar to those which are found in artificially fermented liquids. Sugar boiled with sulphuric acid gives rise to dark products, and a dark tint is also given by other acids. In fact the substances so produced are at least analogous to the products of decomposed vegetable matter. Grape sugar is not charred by sulphuric acid, but alkalies and alkaline earths rapidly cause it to become brown; and it is probable that the brown tint acquired by the juices of many plants when diseased owes its origin to this cause. The effect of organic acids is first to convert cane sugar into Grape sugar, and then to form with the latter compounds which will not crystallise, a point of much consequence in an economical point of view, and possibly in a pathological.

179. The next substance named above is starch, the formula of which is $C_{12}\,H_{10}\,O_{10}$, which occurs not

* A comparison of the third edition of Gregory's "Handbook of Organic Chemistry," published in 1852, and which gives an account of the state of the science up to the end of 1851, with that of 1847, which reached only to the end of 1846, will show at once the different state in which the science of organic chemistry is at present from what it was five years previously. The light recently thrown on endosmose and exosmose is a great step in advance since the date of that publication.

† It would be a great improvement to substitute some general name like celluline for this, but I am too little instructed in chemistry to presume to hazard such a change.

only in the seeds of a vast variety of plants but in their tissues, and in some places is represented by its ally inuline, which occurs in many Compositæ. Its great use in plants is the facility with which it is stored up without passing into decomposition, and at the same time the rapidity with which when requisite it is converted into sugar, so as to be capable of traversing in a soluble form the tissues which, by an increase of nutriment, are destined to produce new growths. Starch, moreover, is not only convertible into sugar, but into an intermediate substance called dextrine, from a peculiarity which it exhibits when examined by polarised light, in which state it is equally soluble and fit for nutrition. In diseased tissues the starch gradually but slowly disappears, and is often stained by the brown humates, &c., which arise from the neighbouring decomposed matter. *M.J.B.*

ACROPHYLLUM VENOSUM.

The finely serrated bronzy-coloured foliage of this plant renders it a pretty object at all seasons of the year, and when seen in the form of a well flowered specimen it has a very striking effect; unfortunately, however, it is very impatient of improper treatment, and must be allowed to be rather difficult to manage successfully; its culture, however, is not so much a matter requiring any particular skill as careful and constant attention, and with this, any grower of moderate experience may produce handsome specimens. Short-jointed, rather firm bits of the young wood, slipped off with a heel and carefully managed, are not very difficult to root, but beginners will save time, and probably disappointment, by procuring nice dwarf, bushy, healthy young plants from the nurseries. These, if procured at once, should be considered to have completed their growth for this season, and should be placed near the glass in the greenhouse, or a well-ventilated pit, taking care, however, not to expose them to cold drying winds. During winter, water must be very carefully administered to the soil, for if this ever gets sodden, the plant will be ruined; and although it may linger for a while, it will be only to excite hopes which will never be realised, therefore endeavour to keep the soil in a healthy state as to moisture, but let it be bordering upon dryness, for any little excess in this direction is not so likely to be injurious as the opposite extreme.

About the middle of March young plants may be induced to start into growth, by placing them where the night temperature is maintained at from 40° to 50°, allowing it to rise some 10° with sunheat and a circulation of air, but there must be no approach to forcing, and the heat should be maintained as much as possible by shutting up early in the afternoon, for it would be very unsafe for beginners to subject this plant to much artificial heat. Keep it near the glass, and maintain a nice moist atmosphere by sprinkling the passages, &c., as often as may be necessary, and lightly syringing the plants overhead on the afternoons of fine days. If the plant has several shoots these should be nicely spread out, and the points of the longer ones pinched out in order to secure compact growth, but do not stop too freely until growth has fairly commenced. As soon as the buds are perceived to be pushing, examine the state of the roots, and if the ball is well covered with healthy active roots, give a moderate shift, but avoid shifting unless more pot room is really wanted. Also be careful to have the ball moist, and the soil to be used in a healthy state, and water very carefully for a month or so after potting, keeping the atmosphere moist and syringing overhead every fine afternoon, or oftener, where fire-heat is used. When growth fairly commences be very careful not to expose the tender foliage to currents of cold drying air; but admit air freely on every favourable opportunity, and avoid keeping the atmosphere so warm as to induce weakly growth. From the middle of April to the beginning of May, according to the state of the weather, remove the plant to a cold frame, which, with a little attention, will be a much more suitable situation for them after this season than the ordinary greenhouse, or a house where fire-heat is used. If drying winds occur after removing the plants to a cold frame, give air very sparingly, raising the sash a little on the sheltered side, and use a slight shade to keep down the temperature: but during fine weather give air freely, and secure a thoroughly moist atmosphere by sprinkling the floor of the pit every morning and evening, and the plants overhead every fine afternoon, shutting up close for the evening, but give air for the night. As growth advances attend to keeping the shoots nicely tied out, and stop, as may be necessary to secure close growth. If a second shift is necessary this should be attended to as early in the season as it may be wanted, so as to allow of getting the plants well rooted into the fresh soil before winter.

As soon as cold damp weather occurs in autumn, remove the plants to a situation near the glass in the greenhouse, and treat them as directed for last winter. If it is intended to allow them to flower, they should remain in the greenhouse, and be slightly shaded while in bloom; but if it is intended to grow them another season before flowering, the shoots should be cut back, so as to remove the flower buds, placing them in a situation where they can be kept moist, in order to encourage growth. Attend to potting as may be required, and otherwise treat them during the growing season as directed above, only stopping should not be practised later than June, as stopping later in the season would tend to cause them to flower weakly and irregularly. The plants will require to be slightly cut back, and to have their shoots tied out and regulated every season after flowering. For soil, use good rich fibry peat, selecting the very best pieces, and be careful to have it in prime condition as to age, &c. This should be broken up rather small and intermixed with a liberal proportion of silver sand and a sprinkling of lumpy bits of charcoal, or clean potsherds broken small. In potting be sure to secure perfect drainage; and make the new soil rather firm about the ball, to prevent the water passing off through it too freely. *Alpha.*

SOME PRINCIPLES OF VEGETABLE PHYSIOLOGY,

BEARING ON THE CULTURE OF PLANTS.

By Professor W. H. de Vriese, of the University of Leyden,

(*Translated from the Dutch.—Continued from p.* 613.)

All the solid parts, and also the leaves, have their origin from the fluids. If the fluid, which is the means of leading the dissolved substances, of which the tissues are formed, and whence arise the leaves, sprouts, and branches, which are produced during the growing season, the above mentioned amount would yet be increased with that of the water, which has been necessary to form the solid substances, of which consist the new solid parts. There are plants called pitchers, in which some leaves have a peculiar way of development. They are found in the East Indies (Nepenthes), in Australia (Cephalotus), in North America (Sarracenia), in Guiana (Heliamphora). We shall only speak about the first of these forms, which is best known to us, being found in the Dutch East Indies. One of the beautiful East Indian pitchers has been called after Sir Thomas Stamford Raffles, the English governor of our East Indian colonies, during the French dominion. This plant is a native of Sumatra. Some years ago it was introduced from that island into England, and in 1850 it was transported by myself from there into the botanical garden of Leyden, where two vigorous specimens of this plant are now in cultivation. In the last century a form of this genus was known by the name of Nepenthes distillatoria, because at that time it was thought that, by a sort of distillation, a fluid from the plant was collected in those pitchers, and by which, if they opened their lid, the plant would be moistened and refreshed.

These plants have been known to us for some years through the discoveries made by Dr. Korthals, who has visited Sumatra, Java, and Borneo. Before the lid opens itself, the pitchers are generally half filled with fluid, which arises from the inner surface, but is not derived from dew or rain. The secretion of moisture continues also after the opening of the pitchers. Fluid has been seen secreting anew in the empty pitchers, and the observation has been made that those plants which grow in the shade have less fluid in their pitchers than those which are exposed to the sun. When the pitchers were closed with thin membranes, fastened by means of silk threads round the margins, it was proved that the secretion of the day surpassed that of the night. Thus the fluid is derived from the inner surface of the pitcher itself, and has not its origin from the atmosphere, as has been pretended.

It has been an error to attribute to those pitchers, which must be considered as a particular expansion of the leaf, an alternate closing and opening. To see how impossible this reclosing is, we need but consider to what a change the mouth of the pitcher and the cover itself are subjected. The fluid itself is of an insipid sweet taste, and when out of the pitcher it soon spoils. When the stalks were cut off, and the plants placed in water, the secretion of fluid in the pitchers ceased. Thus it is through the stalks in their natural connections that the fluid secreted in those pitchers must be supplied. While in some sorts of plants the evaporated fluid is collected in parts destined to that purpose, in others it is gathered on the top of the leaves. Some Aroideous species furnish examples of it, and it appears that the form of the leaf veins (which some people call the nerves), and which concentrate at the points of the leaves, are the cause of this phenomenon.

A similar phenomenon is seen among more plants of the group of the Arads, especially those with colossal acuminated leaves, in which the evaporated moisture is collected at the top of the leaf. It would be superfluous to show that the evaporation on the surface is considerable, and that these many functions of the plants are very closely connected. It has been remarked that in countries where the seasons regularly alternate, where warmth and cold succeed each other, the trunks and branches regularly increase in thickness. If they be cut through in a horizontal direction, then we remark circles which enclose each other. It has been with certainty shown that every year adds another circle to those already existing. This causes the increase of thickness in the trunk. The time at which the peculiar thickening of the trunk takes place in this country is in the months of June and July. By the number of those circles we determine the age of trees and of the different branches on the same trunk. To this end is the trunk prepared in the spring; at first when the ground is warmer than the air—later, when the atmosphere is warmer than the earth and the inside of the branches. Then especially the evaporation is suddenly increased, and the organs of the plants appear as if by some magic power. Evaporation, ascension of sap, and absorption must keep pace. The sap that nourishes the buds causes the development of the leaves, and contributes to their expansion, rises into the young wood, and in the outermost stratum (called cambium), which consists only of young cells, it is present in large quantities.

The young wood-cells multiply very quickly, and thus a new circle of wood is formed. But let it be taken into consideration, by how great a mass of solid material a tree is increased yearly; let it be remembered as well, what we have advanced above, that only a very small quantity of other substances is taken up out of the ground with water into the tree; and then it will not be difficult to determine that the amount of water which in the spring and summer passes through a tree must immeasurably surpass all calculation or conception. A simple illustration of this appears if you cut away the slips from among the trunks of the trees. A stream of liquids, difficult to stop in its course, and having the appearance of the clearest water, escapes. In America holes are bored in the trunks of certain Ash trees, to collect a sugary sap, which being fermented, yields a spirituous drink. The buds, like so many pumps, draw the sap upwards, and they do this in proportion as they expand.

Absorption and evaporation must proceed in like proportion. As the warmth of the atmosphere diminishes in the evening, so the ascension of liquids also diminishes. When the degree of moisture in the air is so great that it, as if saturated with water, can take up no more moisture from the plants, it is immediately visible in the latter. If the evaporated water on the surface of the leaves is disturbed in its action, the plants become sick and die.

(*To be continued.*)

TRADE MEMORANDA.

Who is Mr. H. Minton, of 51, Commercial Road, Lambeth?

The gentleman called Seymour, Bradley, Blomfield, Stevens, &c., is, we believe, out of prison, and nurserymen will do well to be on their guard.

Home Correspondence.

Winter Peas.—Prepare for sowing Peas during winter, by collecting as much peat dross as can be got; the refuse of a peat or turf stack will answer well if it is broken small and put through a sieve or riddle—such soil as is used for potting Heaths will do. If it be procured from low marshy ground, and of a sulphury nature, so much the better; if not, a little flower of sulphur mixed amongst it will be an improvement, as it tends to some extent to counteract the ravages of mice and the effects of frost. Where the ground is wet, or the climate damp, I have found this simple and cheap preparation of the utmost importance. It must be sown thinly and regularly in the bottom of the open drills, immediately previous to sowing the Peas; also sow it thinly over the seed in the same manner, then cover slightly as usual, and there need be no fear of losing any of the seed by splitting or rotting, and I have found this preparation indispensable for all the wrinkled varieties, such as Hairs' Dwarf Mammoth. Unless the soil be very dry, the mould should be left loose until it becomes dry in the spring, and then it may be well pressed by the feet close to the plants before earthing them up for the poles or stakes. Young gardeners in general object to the sowing of the earliest varieties, such as Prince Albert, Warner's Early Emperor, &c.; but if they adopt my plan of digging and dunging for Cabbages, they need not fear having too light crops. Sometimes, when circumstances will not admit of preparing the ground for Peas in the usual way, I open trenches 12 or 15 inches wide, a spit or two deep at proper distances, laying the top spit on one side, and the other spit, with a shovelling out of the bottom, on the other, so that I may turn the top to the bottom, over a sufficient quantity of dung—the more littery the better, or leaves will answer as well; fill up the first trench, and sow the Peas, which cover from the bottom of the next trench, and so on until all the quantity required be sown. If wanted very early, hot dung should be used. *Robert M'Nab, gardener, Cannan Cottage, Morningside.*

Disinfecting Cesspools.—Perhaps some of your chemical correspondents will kindly answer the following question. Given a cesspool 10 feet square and 12 feet deep, how many quarts of Burnett's disinfecting fluid would be required to enable men to clean it out without suffering any inconvenience from the smell? *W.R., Oct.* 4.

Protecting Pits, Frames, &c.—Nothing is equal to or so effectual and inexpensive as a protection to pits, frames, &c., as glass crates stuffed with shavings, and placed all round these structures; they are dry non-conductors, and when packed together, have a neat tidy appearance. Trellis shutters, also, stuffed with shavings, when laid over the lights, are very efficient in keeping out frost. As mats are scarce and dear, and we are likely to have a sharp winter, the above method of protecting plants, &c., might become very general with great advantage, as it has three essential qualities—namely, durability, cheapness, and simplicity to recommend it. *An Observer.*

Potatoes.—Permit me to offer you a few remarks on the protection of Potatoes from disease; I had a south border planted with Ash-leaved and Lapstone Kidneys, Early Manleys and Early Snowball. I had them manured as follows, viz., part of them with soot and salt, and part with good stable-yard dung, leaf-mould, coal-ashes, and old decayed tan. I could not say that there was any difference in the growth of any of them,

except those planted in soot and salt, which did not turn out so well as any of the others. About the latter end of July, a few days after a severe thunder-storm which we had here, the leaves and haulm became spotted, and began to smell very badly. I had all the haulm cut off within about 6 inches of the ground, and I lifted every other row for present use. I had the rows which were left all covered with soil to the depth of 18 inches, beating the soil firmly on the top of the ridge with the spade. I had them all lifted a few days ago, and to my great satisfaction they had all escaped the disease. I left a few rows uncovered, and I am sorry to say that I had not one sound Potato to any set planted. All the Rose leaves, Peaches, French and common Beans, Endive and Rhubarb leaves here, are spotted and burned, just as if vitriol had been sprinkled over them. *James Morgan, South Wales.*

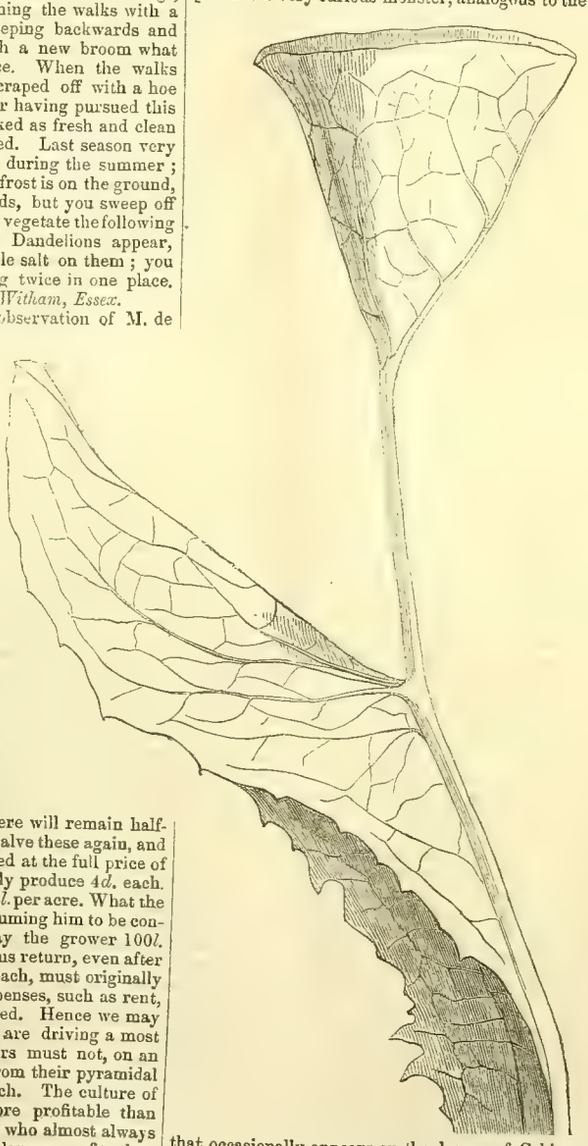
Weeds on Walks.—In order to prevent weeds from growing on walks, put a layer of gas-lime under the last inch of gravel. This also helps to bind the gravel. *J. W. R., Bromley Hill.*——The following is the way in which I managed walks when I was a gentleman's gardener. In one situation I held I had three miles of gravel walks to keep in order. In winter, when there was sufficient frost to freeze the gravel in the mornings, I employed the labourers in cleaning the walks with a half worn out Birch broom, sweeping backwards and forwards, and then removing with a new broom what the old ones took off the surface. When the walks were covered with moss it was scraped off with a hoe before the broom was used. After having pursued this practice for 6 years, my walks looked as fresh and clean as if they had been newly gravelled. Last season very few weeds made their appearance during the summer; by performing the operation when frost is on the ground, you not only remove all small weeds, but you sweep off most of the seeds deposited there to vegetate the following summer. If Docks, Thistles, or Dandelions appear, cut out their crowns, and put a little salt on them; you will not have to repeat the salting twice in one place. *G. Taber, Rose Cottage, Rivenhall, Witham, Essex.*

Profits of Pear Growing.—An observation of M. de Jonghe, in one of your late Numbers, to the effect that England, from mismanagement, is tributary to Belgium for Pears, induces me to remark the high price at which this fruit is retailed in Covent Garden. I have seldom been able to purchase first-rate winter fruit, such as Winter Nelis, Beurré Rance, Easter Beurré, or Ne plus Meuris, under 6*d.* a piece, and never under 4*d.* Now let us suppose an acre stocked with pyramidal trees, at 6 feet apart, there is room for 1210. In good condition, they surely ought to produce two dozen Pears each; but let us suppose that every other tree is absolutely barren every alternate year; the average will then be a dozen fruit per tree. Let us now assume that even of this dozen one-half is cracked, pecked, rotten, or otherwise unsaleable; there will remain half-a-dozen in good condition. Let us halve these again, and suppose that only three can be retailed at the full price of 6*d.*, and that the other three will only produce 4*d.* each. We have thus 2*s.* 6*d.* per tree, or 152*l.* per acre. What the retailer's profit is I know not, but assuming him to be contented with 52 per cent., he will pay the grower 100*l.* Now 100*l.* an acre seems an enormous return, even after allowing that the trees, at 1*s.* 6*d.* each, must originally have cost 90*l.*, and that annual expenses, such as rent, taxes, and labour, have to be deducted. Hence we may conclude, either that Pear-growers are driving a most lucrative trade, or else that amateurs must not, on an average of years, expect a return from their pyramidal trees of even six good fruit from each. The culture of standards is usually considered more profitable than pyramids. If so, market gardeners, who almost always plant standards, will actually realise larger profits than those I have indicated above. *S. B., Bromley.*

Cuthill's Black Prince Strawberry.—I think it but just to Mr. Cuthill to add a few remarks to those made last week by Mr. Smith, respecting this Strawberry, which, I am of opinion, has no equal as regards productiveness; and with a little perseverance and accommodation, it may be had in fruit during the whole season. I find it most useful for early forcing, there being no difficulty in getting ripe fruit from it early in February, and in keeping up a constant succession until ripe fruit can be had out of doors. The earliest forced plants should have their blossoms and fruit stalks cut off and turned out into a sunny border about the middle of March. A succession crop should be turned out a month later, and other successions at intervals afterwards. These will keep up a good constant supply until November, or if slightly protected, and the frost not very severe, they will ripen fruit until the middle of December. For some time past I have been gathering excellent Strawberries, and I have no doubt that I shall continue to do so for weeks to come. For a winter supply, I reserve plants of those forced for the last spring crop, which if placed in a shady situation, and carefully watered during the summer months, will throw up strong trusses of bloom by the end of September, or if a few earlier runners are layered, they will also produce fine trusses late in autumn, and by introducing the plants into a slight bottom heat at intervals, a constant supply of fruit may be kept up until the early forced plants come into bearing. I find the two-year-old plants, or those which have been forced one season, the most productive, and they may safely be introduced into heat whenever required with more certainty that young plants. I understand that some of your correspondents have found this variety subject to mildew, and have consequently spoken against it; if sulphur, however, is applied to the pipes or flues occasionally, no mildew will make its appearance. *Edward Bennett Perdiswell, Worcester.*

Vegetable Pitchers.—I found the other day such an extraordinary sport of nature in a Lettuce leaf that I could not help cutting it and forwarding it to you. You may not receive it in good condition, but the leaf was perfect in itself, with a stem rising from the middle of the leaf quite round, and supporting a perfect green funnel; the curious thing is, that it shows no deformity, and might belong to a plant whose natural habit was to grow in that way—not a bad idea for a tropical climate. *John Birch Reynardson, Caseby Rectory, Stamford.*

[This is a very curious monster, analogous to the pitcher



that occasionally appears on the leaves of Cabbages, an example of which was published years since by De Candolle in the Transactions of the Horticultural Society. In a scientific point of view the importance of such instances can scarcely be over-estimated; for they assist in demonstrating the fundamental fact that in vegetation there goes on a hollowing process wholly independent of the property of forming cavities by the lateral adhesion of verticillate leaves. We have in these accidents the true explanation of the pitchers of Nepenthes and Sarracennia, of the so-called, but erroneously-named, calyx-tube of Escholtzia, Rosa, Myrtus, and the like. This has been long ago pointed out, and we are surprised to find it wholly unnoticed in Dr. Balfour's "Outlines of Botany," a copy of which has just reached us.]

Notices of Books.

The Subject Matter of a Course of Ten Lectures on some of the Arts connected with Organic Chemistry. By Wm. Thomas Brande. Longmans. Fcp. 8vo, pp. 382.

This excellent little work contains the substance of the 10 farewell lectures delivered by Professor Brande at the Royal Institution. The subjects discussed are the most important applications of organic chemistry to the arts, viz., amongst others, dyeing, bleaching, calico printing, tanning, the manufactures of sugar, soap, and candles, and fermentation; and the text is edited by Mr. Scoffern from the notes of the lecturer himself. Both to the professor and to the editor the public are, we think, greatly indebted for so much information in so agreeable a form. The desire to become acquainted with the great principles of chemistry, and of natural philosophy in general, is no longer confined to a few, but is, to the great benefit of society, rapidly increasing and spreading amongst all its members; and whenever a person thoroughly capable takes the trouble to assist them in the attainment of their desire, by laying before them in a clear, methodical, and withal agreeable manner, the results of his own long study and experience, he is certainly entitled to their thanks, whatever anti-Gradgrinds may say or think to the contrary. Notwithstanding the many excellent treatises on chemistry which have appeared in the English language, there seems to be still wanting a work similar to the admirable Leçons of M. Girardin (being lectures publicly delivered by him to the working-classes of Rouen), a treatise, we mean, in which the great principles of chemistry, and they alone are brought prominently forward, are explained in as familiar language as possible, and illustrated by common examples, and the most important applications to the arts and sciences. Professor Solly's "Agricultural Chemistry," Professor Faraday's lectures on "The Non-Metallic Elements," and the present lectures of Professor Brande, supply the place of such a work, so far as each of them extends, and we yet hope to see others of a similar class, which will complete the series. The following extract will serve to show the manner in which important useful information is intermixed with the more technical portions of the lectures.

In the chapter on fermentation, after describing the mode in which wort is prepared for brewing, the Professor continues:—

"The wort is next boiled with hops, which were first introduced into this country from Flanders, in the reign of Henry VIII. Their active constituents are essential oil, bitter extractive, and a little gum and resin. A very important part of the management of hops consists in the manner of drying them, which is performed in a kind of kiln, called in Kent and Sussex, oast houses; they are, for the most part, very unscientifically constructed; and would apparently admit of easy and important improvements. To give them a proper marketable colour, and to prevent the communication of a disagreeable tint to the beer, the hops are subjected to a species of bleaching, or fumigation with sulphurous acid, and are finally packed in bags, or pockets, and subjected to considerable pressure, so as to exclude the access of air.

"The relative proportion of Hops used in beer varies according to the desired quality of the liquor; about one-twentieth of the weight of the malt is, I believe, the average proportion. Their influence is very important; they diminish the tendency of the liquor to secondary fermentation, and other mischievous changes; by their aromatic bitter they cover sweetness, and impart a new flavour and fragrancy. These qualities are partly referable to the volatile oil of the Hop, a part of which is dissipated in the steam escaping from the boiling coppers, which should be so constructed as to retain the largest possible quantity of aroma.

"No substitute can be found for the Hop as regards the agreeable qualities which it imparts to the finished beer, except, indeed, as respects mere bitterness; and the present rage for bitter small beer has led to the use of Quassia, Camomile, Gentian, and some other pharmaceutical bitters, which, when judiciously and homœopathically employed, are fit enough for the purpose, being harmless and inexpensive; but they are all open to the palpable objection of leaving more or less of a permanent, and not pleasing bitterness, on the palate, totally different from that resulting from the Hop. The Nux vomica, which contains the highly poisonous, and at the same time intensely bitter alkaloid strychnia, is said to have been imported in such large and increasing quantities into this country, as has led to the suspicion of its employment for these purposes; so that some brewers have deemed it necessary to refute such notions by a reference to the analytical labours and testimonials of the highest chemical authorities. These and many other notions, regarding the similar applications of Coceulus indicus, opium, tobacco, and other narcotic poisons, have their origin in the discoveries and exposures which the officers of the excise have occasionally divulged, and are, to a certain extent, sanctioned by the disclosures of treatises on brewing, by 'old practitioners,' and by the existence of brewers' druggists; and, no doubt, obscure and illegal brewers do resort to such and other adulterations; but it seems probable that the retail dealers are the greatest sinners, and that public-houses and beer-shops are the chief seats of sophistication. It is curious to observe the miscellaneous products of the row of pumps which adorn the taps of these establishments.

"You may consult Mr. Accum's book on 'Culinary Poisons,' if you desire further details upon these matters, and we will now resume the legitimate operations of the brewery."

We may also quote some very entertaining records of the history of sugar, and of the opinions entertained about it upon its first introduction to common use.

"Happily for the interests of sugar, physicians then, as now, were not unanimous. While some violently abused it, others became its powerful advocates; amongst

the latter figures prominently, and, it may be said, creditably, Dr. Slare. He went to work like a true enthusiast: not content with asserting the innocence of sugar, he elevated it almost into the rank of a panacea; not content with eating sugar abundantly, he smeared his skin with syrup, to the great comfort of the same, as he informs us; and he used powdered sugar for snuff, which, we are told, 'did comfort his fauces, a quality which tobacco-snuff did not possess.'

"This celebrated advocate for sugar deserves credit for the industrious collation of facts he has handed down to us in support of his position—facts not only drawn from the restricted circle of his own profession, but also from collateral sources. The following testimony, embodying an important statement in gastronomic zoology, is of this kind.

"'I have known,' says he, 'a farmer near London feed his roasting or his sucking pigs with white sugar in their milk, which made them sell for three half-crowns, and sometimes ten shillings a piece; and I was told by the farmer's landlady, who had tried them, that they did far exceed the flesh of the common sort.'

"But perhaps the most telling case in favour of the good qualities of sugar, was that furnished by Dr. Slare's own maternal grandfather, Mr. Malory, of Shelton, in Bedfordshire. Everybody is aware of the common prejudice, that sugar destroys the teeth. Now Mr. Malory, who remained a great sugar eater all his life, shed his teeth in favour of a new set when he was nearly a centenarian! 'He lived,' remarks the great advocate of sugar, in a letter written in the year 1714, 'an active, but sober and temperate life. He loved the diversions of hunting, a gun, and a hawk, which he kept himself; he was very regular in his method of eating and drinking; he made three meals a day, but did only eat flesh at dinner; he drank every morning near a pint of good soft ale; he then walked in his orchard so many turns as made a mile; he did the same in the even of his old age; he obliged me to walk 15 miles with him after he was fourscore, which he did without being weary. He seldom drank wine, but when he did, it was canary. He never drank between meals; his eyesight was so good, that he could take up a pin from the ground when he was between 80 and 90. I have seen him kill a single bird with his gun. His stomach never failed him to the last, nor did he remember that he was troubled with the headache. In his 82d year he was observed to be very strong and cheerful, his hair to change somewhat dark; in that year some of his old teeth came out, and were found to be pushed out by young ones, which continued to do so until he had a new set of young teeth quite round.

"'He lived easy, and free from pains or any sickness, to his 100th year, and in that year died of an apoplexy. He delighted in all manner of divertments. He used in the morning to spread honey upon his bread and butter some part of the year—at other times to strew sugar over his bread and butter; he loved to have all his sauces made very sweet, especially with his mutton, hashed or boiled, or any other sort of meat that would bear sauces, he ordered them to be so sweet, that to others they tasted luscious.

"'The good effect it had upon this old gentleman, my grandfather, together with the pleasant relish I received early in my youth, by dieting with him, made me always a lover of sugar, which I have for some years past used very plentifully, especially in my wine, and also in my ale on various occasions. I have made use of dried sugar in powder to cleanse my teeth—and, by rubbing it into my gums, to cure them when sore and swelled; but this happened seldom, unless I had neglected the use of sugar for many months. My teeth are at present 28, the usual complement of most persons; are all of them sound and well fixed in their places; these never gave me the trouble of the toothache.'"

"'Out of respect to the fair sex,' our author goes on to say, "especially those that love their beauty, or fine proportions, as well, if not better, than their lives, I shall suggest one caveat, or caution, to those that are inclining to be too fat—namely, that sugar being so very high a nourisher, may dispose them to be fatter than they desire to be, who are afraid of their fine shapes; but then it makes them amends by supplying a very wholesome and goodly countenance, and sweetens peevish and cross humours, where they unhappily prevail."

If we must criticise anything it will be the figure of a Date Palm at p. 163, drawn by some clever artist no doubt, but to our eyes much more like a Sago Palm than what it professes to be.

New Plants.

91. Phrynium micans, *Klotzsch in Allgem. Gart. Zeit.*, *Aug.* 12, 1854—*aliàs* Maranta micans, *Mathieu Cat.*, 1853.

This is represented to be a stemless plant with small undulating papery leaves, dark green, and shining on the upper side, with a middle longitudinal streak of a whitish red colour; dull brownish sanguine on the under side. The flower spike is stiff, slender, dull purple, about 4 inches long, with white flowers in heads, surrounded by rosy bracts. It is of Peruvian origin, and requires a stove; from the account given of it, it would seem to be a useful addition to the list of dwarf plants with variegated leaves.

92. Tovaria pendula. *Hooker.*

"This is an annual Capparid, with alternate triphyllous leaves, a straight branching stem, and terminal drooping many-flowered racemes. The flowers are yellowish white, and in form something like those of Pyrola uniflora. It was discovered in 1842 in the temperate regions of Venezuela, and is a remarkable plant." *Linden's Catalogue*, priced at 5 fr.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—Such conservatory and greenhouse plants as have been in the open air during the summer months have now been brought indoors, and arranged in their winter quarters. Greenhouse climbers have also been pruned in and tied up, in order to give the plants under them as much light as possible. On one rafter the Tropæolum Triomphe de Gand has been placed by way of experiment; it has grown freely during the summer, and as its wood has become well ripened, it is expected that it will be quite a mass of brilliant deep orange, or rather scarlet, blossoms during the months of January and February. Cultivated in pots, we need not say that this is one of the gayest plants we possess; and as its flowers keep expanding in succession for many months together, its value for decorative purposes is great. The small greenhouse in front of the Rose house is at present, as indeed it always is, extremely gay. Among other things, we remarked in it plants of the new Orange Amaranth, whose Clover-like heads of flowers make an agreeable variety among greenhouse plants. It is a perennial, and when larger specimens of it shall have been obtained, and its colours fully brought out, it will doubtless, notwithstanding the naturally dull colour of its blossoms, be well worth attention. Associated with it were Justicia carnea superba, a most useful old fashioned plant, which may be had nearly always in bloom; the well known pale blue Plumbago capensis, and Funkia grandiflora, a hardy plant, but well worth a place under glass, on account of the large heads of white sweet-scented blossoms which it produces. Out of doors slugs are apt to eat its foliage and disfigure its appearance, an occurrence which does not happen under glass.

In pits, were several plants growing on for the winter decoration of the stoves, such as the blue Eranthemum pulchellum; the purple Justicia speciosa, and Pentas carnea, &c., which intermixed with Begonias make a fine display at a time when flowers are scarce. Plants of the brilliant scarlet-flowered Salvia gesneriflora have also just been potted up from the open ground, where they have been growing all summer, and have been placed in pits to be ready for the spring decoration of the greenhouse or conservatory, in either of which few plants can match them for showiness. Speaking of Salvias reminds us that we saw in one of the pits young plants of what Mr. Skinner calls S. grandiflora, a reported new sort, which that gentleman says grows as large as the Orange Cestrum, *i. e.*, 10 or 12 feet high, and which he adds will make a good companion to that fine shrub planted in the bed of a conservatory. Many plants of it have been raised, and therefore as it grows rapidly its value in this country will soon be ascertained.

In the large Conservatory were some admirable plants of the Sedum Sieboldi, which, with its gracefully drooping branches, and multitudes of gay rosy flowers, forms very pretty objects on corners of shelves or other suitable situations. It need scarcely be mentioned that this useful Sedum is quite hardy; but that when out of doors it is difficult to keep it from slugs, which eat and spoil the foliage. It should therefore be grown under glass; and who that has seen a good specimen of it in full beauty would refuse to give it that attention? The Camellias in the bed of this house appear to be unusually well furnished with flower buds this year. Hedychium Gardneri has also been and still is finely in blossom, its great heads of inflorescence measuring quite a foot in length and 10 inches through. This is a plant which no conservatory border should be without. A few Chrysanthemums have already been brought into this house, and some of the earlier Pompones, as Hendersoni, are even now bursting into bloom. Others are set along the gravel walk outside ready to be introduced whenever they may be required. All of them are good plants and well covered with bloom buds.

In a shallow frame in front of the Orchid house—without heat except what passes into it through the wall of the last-named house, planted among pieces of rock, and dwarf Cacti—is a great patch of Oxalis Bowei, which is at present one mass of blossoms, rosy and cheerful in appearance, each flower being as large and round as a shilling. During the day the lights are kept constantly off; the effect, therefore, of such a display of floral beauty may be easily conceived. When once established, it is a plant which requires little further care, and few things in its season are more handsome.

In Mr. Ewing's glass wall, such plants as have survived the winter have made vigorous growth, and some of them, as the handsome porcelain blue flowered Iochroma tubulosum, Abelia triflora, and China and other Roses, are now in blossom. Bignonia grandiflora also promises to flower here, where it is screened from the early autumn frosts. Of fruit trees in it we hope to have a better account to give next year than we have this, the frost of the 24th of April having killed all the blossoms.

Among late annuals out of doors, Bahia latifolia deserves notice; plants of it sown in the open ground in May being now finely in bloom. It grows about 18 inches high, and bears starry yellow flowers about as large as a half-crown piece. Tagetes sinuata is also a good late annual, its orange blossoms, though much smaller than those of the Bahia just named, being produced in sufficient abundance to render a mass of it effective. Dianthus Gardneri, a fringed Pink, of a purple colour with a white eye, is likewise a useful flower at this season.

In the orchard department, Peaches and Nectarines have now, for the most part, been gathered, the only exception we noticed being a few Late Admirable Peaches, which are scarcely yet ripe. What Pears there are on walls are very fine this year. Some specimens of the Duchesse d'Angoulême measure as much as 12 inches round lengthwise, and 11 inches in circumference. There are also some good Beurré Rance and other sorts, of which we shall be able to report fully next month. Three of the small Pear trees in pots in the orchard house have also produced a few large and fine fruit. They are new sorts, of the quality of which there will soon be means of judging.

FLORICULTURE.

Tulips.—Examine the bulbs, and, if not previously done, let them now be arranged for planting, making the alterations and improvements noted down in your Tulip book during blooming time: this I do immediately the bulbs are taken up, while the changes intended to be made are fresh in the memory; I also procure at once any new varieties I may wish for, and then re-arrange them. The bed should now be got ready for planting. If the soil has only been in use one year, and the bulbs have done well in it, there is no advantage to be derived from changing it, for they will do well in the same soil (if it be good) for two or three successive years; all that is required is to remove about 3 inches from the surface, laying it in a ridge by the sides of the bed; then fork over the mould left in the bed, laying that also in a high ridge for a week or 10 days. If the soil requires changing, it need not be all removed. About a fortnight ago, I took nearly 10 inches off the top of my bed, then I put about 6 inches of two-year-old rotten turf and loam and road grit, well mixed together (three-fourths loam and one-fourth grit), on the soil left in the bed, forked it well over two or three times, turning some of that left with the mould just added, so as to mix it well, and laid it up in a high ridge; two or three days before planting, this is raked down, laying it 2 inches higher in the middle than the sides. In planting, I place a small quantity of river-sand on the spot the bulb is to occupy, and put as much sand upon the bulb itself as will just cover it; then I carefully put the mould on the bed, covering the bulbs 4½ inches deep in the centre, and 3 inches the outsides; I protect the bed at once by placing small-sized iron hoops over it, rising about 6 inches from the surface, and run some small string diagonally between the hoops. About the second or third week in the present month is the best time for planting in general, though, on account of the lateness of situation, I never plant later than the first, if the weather will allow it to be done. The best plan is to begin planting whenever the bulbs push forth their green spear, and the fibres swell at the bottom of the root (some of the early blooming varieties are already doing so), for the longer they are kept out of the ground when this is the case the greater injury they sustain. I have never used the nostrums some have recommended, but have strictly adhered to the simple practice described above; and perhaps I may be permitted to say that my blooms have always given me the greatest satisfaction. *H.*

Japan Lilies.—Few plants are more useful than the different varieties of Japan Lilies. They come into bloom at a time when our New Holland plants are over, and when an actual paucity of flowering plants exists, wherewith to decorate the conservatory and greenhouse; and what really can be more suitable? They produce a gorgeous display either in-doors or out; and as they are quite hardy they may be liberally planted in the open borders; they thus constitute one of our best autumnal flower garden plants. Their propagation is simple and certain. The bulbs may be separated, and each scale will eventually form a new bulb. This separation should be effected when the flower stems are withered; the scales should be stuck into pans of silver sand, and placed in a cold frame or pit. After remaining one season in this position, they should be planted in a prepared bed of peat soil, and a little silver sand intermixed with it; thus treated the bulbs will soon grow large enough to flower. The cultivation of them in pots is by no means difficult. Immediately when the bulbs go to rest in the autumn is the proper time to repot them. By no means destroy the old roots, but carefully place them amongst the fresh soil. If large examples for particular display are required, large pots may be employed, and half a dozen large flowering bulbs placed in each pot. The soil I use is rough peat. The pots should be well drained, and the crowns of the bulb just covered with the soil; when potted they should be placed in a cold pit or frame, in order to prevent the soil from freezing, although frost will not injure the bulbs. Where room under glass is an object in winter, they may be plunged in the open air in coal ashes, in a manner similar to potted Hyacinths. I have at this time a large number in flower, which have never been under glass until within these few days; they have sustained no injury from exposure. There is scarcely any plant which is so much benefited by liquid manure as the Lily, more especially before expanding its flowers. If used in a clear state, and considerably diluted, this water alone may be applied for at least a month before it comes into flower. If the

object should be out-door cultivation entirely, I should recommend them to be planted in beds; their effect is exceedingly grand. Excavate the soil 18 inches deep, and fill in the bottom a foot deep with very coarse peat, intermixed with one-fifth of decayed manure or leaf-mould. The remaining 6 inches may be entirely peat. If the bulbs are large enough to bloom, plant them 12 inches apart every way, and if beds of each kind are well contrasted one with the other the effect will be magnificent. *S.*

SEEDLINGS.

PANSIES: *W J P.* Your seedling is either Duke of Norfolk or too much like that variety to be of any value.—*J G B.* Much too small.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—The delightful weather which we have lately experienced is very favourable for those who cannot find accommodation under glass for all their plants, but it will be very unsafe to calculate upon its continuance, and everything should be placed at once where protection can be afforded in case of frost occurring somewhat unexpectedly. Where plant accommodation is scarce, and this is the case about the majority of private establishments, it is an excellent plan to have a part of the plant ground covered with some strong rather close canvas, fixed so as to be easily taken off or placed over the plants. This, if properly arranged, will prevent heavy falls of rain being injurious, and will protect the plants from autumn frosts; and a contrivance of this kind is exceedingly useful in spring for preparing bedding stock for planting out. It should, however, be constructed very much upon the principle of Mr. Rivers' hedge-backed orchard-houses, with a slight frame-work of rafters, and skeleton sashes on which to stretch the canvas, to make it partly waterproof. We have a structure of this kind, which in autumn and spring is just as useful to us as if it were an expensive glass erection, and its cost was very trifling. It is also useful in winter for protecting many plants used for forcing, both before they are introduced to the forcing house and after their removal from the conservatory, and renders it safe to place many plants in the open air for a time in summer, which otherwise must be kept under glass. Many of the stove plants which have lately been the principal ornaments of the conservatory will now be getting shabby, and foresight must be exercised, to be prepared with specimens in flower to supply their places. Some of the most forward Camellias should, if necessary, be placed in a rather close house, to induce them to open their buds, giving them a regular supply of manure-water; and the most forward Epacrises may be placed in a close part of the greenhouse, where they will soon open their blossoms; as also Daphnes and many other plants, provided their flower-buds are prominent. Aim at keeping the atmosphere of this house rather dry, using just sufficient fire heat on damp cold nights to allow of giving sufficient air to keep the atmosphere in motion, so as to prevent damp being injurious. STOVE.—The twiners on the roof should now be strictly kept within bounds, cutting back all shoots that have done flowering, and tying the others so as to obstruct the light as little as possible. Place specimens ripening their wood in the coolest part of the house, and water sparingly at the root. Achimenes, Gloxinias, Gesneras, &c., that are properly ripened off may be stored away in any dry place where they will be safe from frost, but take care to place them where they will be secure from damp, and they should not be exposed to a lower temperature than about 45° or 50°, for many valuable plants of this kind were lost last winter through storing them in dry sheds, &c. Many hard-wooded plants, such as Ixoras, &c., that have not made their wood after flowering, should be encouraged with a warm moist temperature, syringing them lightly overhead, and shutting up the house early in the afternoon. Get any growing plants that require more pot-room shifted as soon as convenient, in order to get them well rooted into the fresh soil before winter. Keep a sharp look out for insects, especially black thrips, which are often very troublesome at this season on such plants as Ixoras, &c., growing in a close warm house, and either fumigate the house or remove the affected plants and thoroughly clean them immediately this pest is perceived, for if left to its own way with growing tender-foliaged plants, it soon disfigures the finest specimens.

FORCING DEPARTMENT.

PINERIES.—Plants showing fruit at this season are so valuable as to be well worth any amount of necessary care, for they will afford ripe fruit at a season when the best-furnished gardens cannot supply much variety in the way of fresh fruit. While the present delightful weather continues, they will however require no particular attention; but in the event of cold damp weather setting in, the shows must be carefully protected from damp, and should be kept rather warm and dry until after blooming, when they will not be readily injured by a damp rather low temperature. Those who grow their Pines in pots should gather all those showing fruit together, so as to be able to treat them more judiciously than can be done when they are scattered throughout the whole stock. Plants that have been kept cool and dry for some time past, in order to prepare them for fruiting, should now be placed in a brisk heat, taking care to thoroughly moisten the soil about their roots, so as to get the fruit fairly set and safe before the sunless days of November. Continue to afford young growing stock a warm moist temperature, with plenty of manure water at the root; but use fire-heat sparingly, and avoid drawing the plants by a high night temperature. With proper management and convenience, 70° will be quite safe while the present favourable weather lasts. Successful growers, our forefathers, recommended a low temperature and dry atmosphere, in order to prevent growth after this season, and under their circumstances this was the most judicious practice, but tan beds and dung linings have given place to hot-water tanks and pipes, and the small squares of glass, with their wide black laps and heavy timbers, have been replaced by roofs which hardly intercept a ray of light, and to adopt the practice of former days would be an unpardonable waste of means. It is hardly too much to say that with modern facilities we ought to produce two crops of fruit in the time that was necessary to produce one under the old regime of houses and heating, but this cannot be done by those who are afraid to keep their plants growing after the decline of the season. Those, however, who have still to contend with the disadvantages of dung pits, will do well to regulate the temperature so as to avoid weakly growth, and this must also be attended to under any circumstances. VINERIES.—Take advantage of fine weather while it lasts for getting the wood of young Vines well ripened: use moderate fires with a free circulation of air, and where the object is to ripen the wood keep the atmosphere as dry as possible. Late Grapes not yet ripe should also be assisted with plenty of fire heat, and a free circulation of air, in order to forward the ripening as much as possible while the weather is favourable. Look at last week's directions, and keep ripe fruit cool with plenty of air, to prevent any injury from damp, and cut out any decaying berries directly they are perceived. Houses in which the wood is thoroughly ripe can hardly be kept too cool, and the ventilators of these should be left open night and day in dry weather. This will prevent the continuance of growth, and is the best means of getting the Vines into a dormant state ready for pruning. The border of the early house should be covered with something to protect it from wet; for although there is no immediate necessity for this it will be better done while the border is in a dry, healthy state.

FLOWER GARDEN AND SHRUBBERIES.

Those who have many scarce plants in the borders, which they intend to pot, must be careful observers of the weather; and to ensure being safe, must cover when there is the slightest appearance of frost. Give careful attention to the young stock, and recollect that sturdy, well-rooted plants are much easier to carry over the winter than large plants with long-jointed soft wood, therefore keep the stock cool and exposed to sun and air as soon as it is well established after shifting into the pots in which it is to be wintered. With good convenience late rooted cuttings may still be potted off; but unless they are very thick in the cutting pots we would prefer wintering them in these to shifting at this season, for they occupy much less space in the cutting pots, and having more space for their roots, they are frequently more healthy and require less attention in winter than those that are potted singly. Square 12-inch wide and 5-inch deep pans are very suitable for wintering cuttings of Verbenas, Lobelias, and other plants which can be kept in a small state. One of these will hold some 20 good plants, and with care, to prevent their being injured by damp, they will winter quite as well treated in this way as if potted singly in 4-inch pots, and a vast quantity may be wintered in a small space. Where things of this kind have to be wintered in cold frames or pits, the plants should be potted singly, as they would be very subject to damp off, despite every care, if placed thickly together in pans, and placed where it may be impossible to give air for weeks together. Let us, however, protest against the barbarous system of wintering bedding stock in such unsuitable places. This practice is generally adopted from some mistaken notion of economy; but if a fair calculation of the time required to attend to plants wintered in this way could be made, and all the losses, &c., taken into account, it would be found to greatly over-balance the trifling cost of fixing a proper heating apparatus and a few bushels of coke or coal annually. To the majority of the parties concerned the outlay would be unworthy of consideration, and would be repaid in one season, such as last, by the saving of labour, &c., and the economising of space which would be effected. Where alterations are projected or in hand, these should be proceeded with in the most expeditious manner. Preparations should be made at once for planting things which it may be intended to procure from the nurseries, for besides that there will be a chance of picking the stock for those who plant early in autumn, there is less risk of failure in planting now than at any other season of the year.

HARDY FRUIT AND KITCHEN GARDEN.

Continue to gather Pears and Apples as they become ready, and give careful attention to the store room, which should be kept as cool as possible at this season, with just sufficient top ventilation to carry off the exhalation from the fruit. Some varieties of Pears may be had considerably later in season than their ordinary period of ripening, by allowing them to hang on the trees after the usual time of gathering; but they should be covered with a net, to protect them from birds and to catch any fruit that may fall and prevent their being bruised. If there is not already a good breadth of Cabbage planted out this should be seen to at once, choosing a piece of deep heavily manured land. Also see to planting Cauliflowers where they can be protected from frost, and a bed might be tried under the shelter of a west or south-west wall. We hardly ever fail in wintering a good stock safely this way, but the plants are not allowed to grow too freely in autumn, and are transplanted as often as may be necessary to keep them dwarf and hard, and we have occasionally pulled them up on a fine day in November, and exposed their roots to the sun and air for several hours before replanting them. This checks growth, and prevents the plants being so soft and sappy as if they were allowed to grow unmolested throughout a fine autumn, and with the protection of a mat or a waterproof cloth thrown over them in severe weather, we have found plants, treated in this way, to winter as safely as those under glass, and they often grow more freely after planting out in spring. Lettuces treated in the same way will withstand the severest winters.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Oct. 4, 1854, as observed at the Horticultural Gardens.

Sept. and Oct.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth. 1 foot deep.	3 feet deep	Wind	Rain.
Friday 29	7	30.106	30.070	76	37	56.5	56	57	N.E.	.00

Sept. 29—Foggy; very fine throughout.
— 30—Dense fog, with heavy dew; very fine; foggy at night.
Oct. 1—Foggy and drizzly; overcast and fine; foggy.
— 2—Dense fog; very fine; throughout.
— 3—Very fine; slight frost at night.
— 4—Partially overcast; very fine.
— 5—Fine; densely clouded; slight rain.

Mean temperature of the week, 1¾ deg. above the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending Oct. 14, 1854.

Oct.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 8	60.2	41.6	50.9	12	0.63 in.	1	4	3	2	4	6	6	2
Mon. 9	59.4	43.1	51.2	16	0.52	—	5	1	1	5	10	5	1
Tues. 10	61.1	43.4	52.3	14	0.68	1	2	3	—	7	7	3	3
Wed. 11	62.0	43.3	52.6	13	0.34	1	2	2	2	4	8	4	2
Thurs. 12	59.8	42.5	51.2	15	1.00	3	4	2	—	5	5	7	2
Friday 13	59.6	42.6	51.1	14	0.33	3	4	4	—	6	5	4	2
Satur. 14	59.1	41.2	50.2	13	0.50	1	4	2	1	8	3	4	5

The highest temperature during the above period occurred on the 14th, 1848—therm. 76 deg.; and the lowest on the 14th, 1838—therm. 26 deg.

Notices to Correspondents.

ASPECTS FOR FRUIT TREES: *Iscoed.* It is impossible to state what would be the proper aspect for Pears, Plums, Apricots, Peaches, Nectarines, and Cherries, for this varies in different parts of the country. A sort may succeed well on an east or west aspect in the south, but which in the north would require a south wall. In some gardens, fruits succeed best on the east aspect; in others adjoining, the same kinds do best on the west. As a general rule, the south aspect should be appropriated to Peaches, Nectarines, Apricots, one or two Cherries and Plums, and some keeping Pears in late situations. Pears and Plums should chiefly occupy the east and west aspect; also some Cherries, and an Apricot for succession. Morello Cherries and Currants are most suitable for a north aspect.‖

BOOKS: *A Lady.* Dr. Lindley's "School Botany." We believe the fruit of Tacsonia to be uneatable; it is not, however, poisonous.

DISEASES: *L R L.* You will find an answer to your question at p. 451, 1854, and also in answers to numerous correspondents in the course of the present summer. *M. J. B.*

FRUITS: *J S.* On the south-east aspect you may plant Williams' Bon Chrétien, Marie Louise, Knight's Monarch, and Glout Morceau Pears; and the May Duke and Elton Cherries. On the north-west aspect the Ribston Pippin, Scarlet Nonpareil two Morello Cherries, and two Orleans Plums.‖

GESNERAS: *R W.* Your letter has been sent to "Alpha," who has instructions to furnish a paper on the subject next week.‡

GNATS: *R A H.* We will try to ascertain; but for the moment, these insects have disappeared here.

MCGLASHEN'S APPARATUS: *G P.* Apply to Messrs. Young & Co., 19, Great George Street, Westminster, who are Mr. M'G.'s London agents.

NAMES OF FRUITS: *G W, Rochford.* Pear No. 1 is called Grey Beurré in some parts of the country; it is very different from the Beurré Gris, or Brown Beurré. No. 2, Hessel; 3, Winter Chissel, but little known. The Apple No. 1 is Pomme d'Api; the other is not known.—*S M O J P.* 1, 3, Passe Colmar; 2, Knight's Monarch; 4, 9, Beurré Diel; 5, 7, Louise Bonne (of Jersey); 8, 11, Winter Nelis; 10, Swan's Egg; 12, Chaumontel.—*Shem.* The Apple which you have under the name of the Cider fruit is certainly not fit for any other purpose; it resembles a cider Apple called the Fox-whelp.‖

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*A Z.* Impatiens glanduligera, a kind of Balsam from the Himalayas. The seeds have, no doubt, been sent from England to Sydney, and thence re-exported. You will find it sow itself in your garden if the situation is damp enough, and it will soon become apparently wild.—*J W.* Calystegia pubescens.—*F H S.* A very large variety of Calystegia sepium; we presume the New Holland form, which is particularly handsome.

PEARS: *P.* According to a "Tableau Alphabétique et Analytique des Variétés de Poires," by M. Tougard, the Van Marum Pear is synonymous with the Triomphe de Hasselt, Calebasse monstrueuse, and Monstrueuse du Nord. It is probably the same as the Calebasse grosse, syn. Calebasse monstre, and Calebasse Carafon, judging from various descriptions; but we have not had an opportunity of comparing the fruit.‖

PLUMS: *A B C.* We are unable to give you the comparative merits of the Belgian Purple, De Montfort, and Guthrie's Aunt Ann Plums. As you must remove one of the three from the wall, the De Montfort, being a very early prolific sort, may be very well grown as a standard.‖

THE CAROB OR CAROUBA TREE: *J Y.* We should think this would bear a Devonshire winter. It is tender about London. No doubt Olives will live out of doors in that county, against walls, if not in the open ground.

WARD'S CASES: *W H Strange.* As you have not sent the insects we do not know what they are. Tobacco smoke will probably put an end to them.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6*l.* per ton, free to Railway.
They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.
Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE PATENT ALKALI COMPANY manufacture on a large scale, at their extensive works in Lancashire, Sulphate of Copper (Blue Vitriol), Soda Ash, and Crystal Soda of first-rate quality, which may be fully depended on for purity. The Company's Purple Brown Metallic Paint is also held in high repute as a pigment for Iron, Roman Cement, &c. &c. Orders, &c., to be addressed to MR. JOHN A. WEST, Secretary of the Company, 1, New Broad Street, London.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.
It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

Extracts from numerous Testimonials in favour of JACKSON'S PREPARATION.

"Belmont Farm, Eltham, Kent, August 28th, 1854.
"Sir,—I am now about to perform my promise, to let you know how your prepared Potatoes have turned out here. As a practical farmer of some experience I had despaired of finding any remedy for the disease; but I must confess that a stronger proof of the efficacy of your process in Preserving Potatoes, could not have presented itself than I have now to relate. One of the fields of this farm, the property of Mrs. Stanbury, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the smut. Any person may see the difference of the prepared and unprepared Potatoes at a glance. You are at liberty to make any use you please of this letter, and I remain, Sir, your obedient Servant,
"G. B. BAXTER.
"To Mr. Jackson, "Late of Ruxley Farm, Kent.
"18, Cannon Street, London Bridge."

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

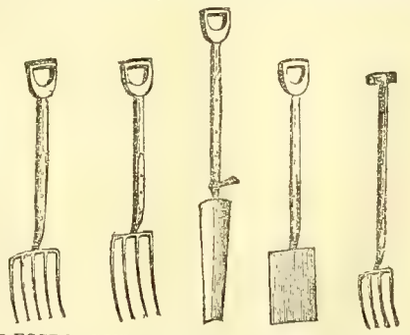
HOSE PIPING.—GREAT REDUCTION IN PRICE.
PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 50 per cent. which advantage is offered to the public.
BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain who on application will forward wholesale and retail prices.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.
The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,
JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.
Every description of Machinery for Raising Water: Fire Engines, &c.

LINSEED AND CORN CRUSHING MILLS.
E. R. AND F. TURNER, St. Peter's Iron Works, Ipswich, have, during the present season, obtained the Prizes of the Royal Agricultural Society at Lincoln, the Bath and West of England Society at Bath, and the Yorkshire Agricultural Society at Ripon, for their celebrated ROLLER MILLS for Crushing Corn, Seeds, &c. These are manufactured of various sizes, particulars of which, with Illustrated Catalogue of Steam Engines, new Prize Chaff Cutter, and a variety of other Implements, manufactured by E. R. & F. TURNER, may be had free on application at the Works, Ipswich, or by Post, inclosing two postage stamps.

M'GLASHEN'S PATENT TRANSPLANTING APPARATUS.
MR. M'GLASHEN, the Inventor of this Apparatus, has to express his regret that delay has hitherto occurred in the execution of orders, from causes over which he had no control. He begs to state that he has now taken entirely into his own hands the Manufacture and Sale of the Apparatus, and that orders will henceforth receive punctual attention.
The Apparatus is suited for Raising and Removing to any distance Trees, Shrubs, and Flowers, of all sizes, with attached Balls of Earth, so that the operation is not only perfectly safe, but does not affect the vigorous growth of the Plants. The use of this Apparatus greatly facilitates planting operations, and saves much labour and expense. The delay that occurred, while to the inventor a cause of regret, afforded him the opportunity of introducing several important improvements, which have served to cheapen the cost of the Apparatus, and increase the facility and security of its use.
Agents will ultimately be appointed throughout the kingdom. In the meantime all orders and other communications are respectfully requested to be addressed to Mr. STEWART M'GLASHEN, Canonmills Bridge, Edinburgh, who will be happy (either personally or by letter) to supply information to Landed Proprietors, Landscape Gardeners, Nurserymen, Foresters, and others.
Canonmills Bridge, Edinburgh, Sept. 1854.

Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Students are admitted after the summer and winter vacations, also in April and October. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

SMITHFIELD CLUB, 1854.
CHRISTMAS FAT CATTLE SHOW.—The Annual Show of Fat Cattle, Sheep, and Pigs, will take place on the 5th, 6th, 7th, and 8th of December, 1854, at the Carriage Bazaar, King Street, Portman Square, London.
All Certificates must be returned to the Honorary Secretary on or before Saturday, the 4th NOVEMBER, 1854.
Prize Sheets, and the necessary Printed Forms of Certificates, are now ready, and can be obtained on application to
B. T. BRANDRETH GIBBS, Hon. Sec.
Corner of Half-Moon Street, Piccadilly, London.

READING CATTLE SHOW SOCIETY, 1854.
PATRON—His Royal Highness Prince Albert.
PRESIDENT—The Most Noble the Marquis of Downshire.
The ANNUAL SHOW will be held in the Reading Cattle Market (under cover) on Wednesday and Thursday the 29th and 30th of November. Stock will be conveyed to and from the Show by the Great Western Railway Company at half the usual charges. Members wishing to exhibit must send Certificates, properly filled up, on or before the 28th October, to
Reading, Oct. 7. RUPERT CLARKE, Hon. Sec.

READING POULTRY SHOW, 1854.
The First Exhibition will take place on Wednesday and Thursday, November 29 and 30. Fee, 3*s.* and 1*s.* 6*d.* per pen. Entries close on Saturday the 28th of October. Prize Lists and Certificates may be had (on forwarding two postage stamps) of
Reading, Oct. 7. RUPERT CLARKE, Hon. Sec.

THE SALISBURY AND WESTERN COUNTIES EXHIBITION OF DOMESTIC POULTRY.—The Fourth ANNUAL EXHIBITION will be held on TUESDAY and WEDNESDAY, the 21st and 22d days of November, 1854. Prize Lists, with the Rules and Regulations, can be obtained of the Hon. Secretary, and Subscriptions will be received by Mr. EWER, the Treasurer. T. PAIN, Hon. Sec.

THE BIRMINGHAM POULTRY SHOW, 1854.
The SIXTH GREAT ANNUAL EXHIBITION OF DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of DECEMBER next. Copies of the Prize Lists and Certificates of entry may be had on application to the Secretary.
In addition to the prizes announced in the list dated the 23d of February last, the General Purposes Committee of the Council have resolved to offer First Prizes of 2*l.*, and Second Prizes of 1*l.*, for Single Cock Birds of any age, of all the following varieties, viz.: Dorking, Spanish, Cochin China, Bramah Pootra, Pencilled Hamburgh, Spangled Hamburgh, Game, and Polish; and that the same shall be entered under Letters A to H on the ordinary certificates, and exhibited separately.
Seven Siver Vases, of the value of six guineas each, will also be awarded, instead of money prizes, for the best pen of Pencilled Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, and Game Fowls.
First, Second, and Third Prizes of 3*l.*, 2*l.*, and 1*l.* respectively, are offered in all the Classes for Fowls, as well as for Turkeys, Ducks, and Geese. Liberal Prizes will also be awarded to good specimens shown by Cottagers, whose entries must be made on a form of certificate different from that used for the general classes.
The ENTRIES CLOSE on SATURDAY, the 11th of November.
JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham, Oct. 7, 1854.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of December next. The PRIZE LISTS and Certificates of Entry may be obtained on application to the Secretary. The Entries close on Saturday, November 11. JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham.

The Agricultural Gazette.

SATURDAY, OCTOBER 7, 1854.

MEETINGS FOR THE ENSUING WEEK.
THURSDAY, October 12—Agricultural Imp. Society of Ireland.

A GOOD deal has of late been published in our columns on the Finger and Toe disease. We have had letters describing the disappointment of farmers who have sown Swede seed, which has produced Rape above ground, and forked warty fibrous roots below; and others which have asserted that the same seed has in one place behaved itself according to its character given by the seedsman, and elsewhere has behaved itself according to the altogether different character which, in the experience of his customers, it has assumed; and lastly Prof. BUCKMAN has described his experiments on the tendency of certain cultivated plants to resume their natural deficiency of character when neglected by the cultivator.

Mr. BUCKMAN seems to think that his experiments on the assumption of the cultivated character by the wild plant, and *vice versâ*, throw light on the finger and toe disease. But this "anbury," or finger and toe development, is a *disease*, and not the mere modified character of a healthy

plant. None that have ever seen or *smelt* a sample of Turnips thus affected but must admit that there is some constitutional as well as local *attack* from which the roots are suffering: and a mere tendency towards the original character of the wild plant will not account for the appearances.

What is to account for them has not yet been very well made out. That the disease *may* assume a hereditary tendency we would not deny—though our own opinion is that it is a result of the condition of soil and perhaps of climate under which the plant is placed, rather than of the character of seed from which it has sprung.

It is well to avoid an indiscriminate style of blame or condemnation, and seedsmen will be much more likely to satisfy their customers when the real cases of dishonesty which happen in that trade, as in others, are separated and dealt with separately—not as characteristic of the whole body, but as characteristic only of those among them whom they as well as we would gladly have weeded out. That there is a possibility of erring on the side of too great severity is obvious from a case to which our attention has been called by a known correspondent, on whom we can place the fullest reliance—a case in which damages were given against one of the most respectable seedsmen in Dublin—for selling Rape instead of Swedes—who has been thus unfairly dealt with. We do not go into the particulars of the case, which, however, may hereafter perhaps be done. The subject is certainly one deserving of the attention of our readers, and if any one can explain the circumstances under which a Turnip shall be sure to run to stem and seed above ground, or to forked roots below, he will do good service both to seedsmen and their customers.

It is not of the smallest service to any one to say, as we did at page 553, that good samples of good sorts of seed Wheat should be selected—that the soil should be rightly prepared for its reception—that vigorous growth during the early stages of the crop should be ensured—that the right proportioning of the seed to the surface should be observed—and so on. What the cultivator desires to know is what *are* the right sorts to be selected—*where* good samples may be had—*how* the soil should be prepared—and in what quantity the seed should be sown. It is quantitative, not mere qualitative, information that is needed; and this, on one or two of the points here insisted on, we will endeavour to give.

And first as to the varieties of Wheat best deserving cultivation. Information has to some extent been already given in our paper; and the Bristol Red of General Arbuthnot's extraordinary field, the Browick Red of Mr. Pawlett's experiments, have been of course much inquired for. If any one asks where good samples are to be obtained we must, of course, refer him to our advertisement columns for information. All we can do is to name good sorts, leaving those who have them to find out their customers in the ordinary way. Perhaps the most likely way to serve our readers just at present will be to give them an extract from Mr. Haxton's article on Wheat in the forthcoming number of Blackie's "Cyclopædia of Agriculture." We shall select his notices of the Chiddam, Fenton, Hunter's, Talavera, and Red Straw White varieties of Wheat, and of the Spalding and Piper's Thickset red varieties—the Bristol Red and Browick Red our readers are already well acquainted with. The bearded varieties we do not name—they are all, without exception, within our knowledge, coarse in quality, however productive they may be in quantity.

White Wheats: 1. *Chiddam Wheat.*—This is an old and highly esteemed English variety of white Wheat, and is very generally cultivated in the finer Wheat districts of that country. It is a free grower, tall strawed, fine square ear, singularly free from awns, grain round, fair but starchy, and flour a little soft. It is remarkably well adapted for soft easy soils in good condition, as it ripens early, and is not liable to lodge or to become mildewed. Weight per bushel seldom under 61 lbs. even in wet years, and as high as 66 and 67 lbs. in dry summers. When cultivated in Scotland the seed requires to be changed every two years from the south of England, otherwise deterioration rapidly ensues.

2. *Fenton Wheat.*—In the summer of 1835 the late Mr. Hope, of Fenton Barns, East Lothian, noticed three ears of Wheat growing from one root in the centre of a quarry on his farm. This quarry is composed of columnar basalt, and at the time the three ears of Wheat were discovered there was a large quantity of debris in the centre, from which these had sprung. The present Mr. George Hope was with his father when the plant of Wheat was first noticed, and he remarked that it could not well have long straw growing in such a place, and very likely was only Hunter's Wheat accidentally dropped there. Under this impression he very reluctantly, but by his father's desire, pulled the three ears of Wheat when ripe, and dibbled out the produce year after year. When enabled to sow it in quantities, and to compare it with Hunter's Wheat, it was found to be obviously distinct from it, and also from any other sort Mr. Hope was acquainted with. He describes it as remarkably short and stiff in the straw, and from its unequal length a sheaf is generally a mass of ears from the band upwards. Although to appearance there is little straw, yet when weighed there is less difference betwixt it and longer strawed varieties than might be supposed, in consequence of its extreme density; and in comparative trials with Hunter's Wheat, Mr. Hope always found the new variety to yield as much weight of straw, though greatly less in bulk. For some years at first the quality was inferior to Hunter's, but latterly it has become far superior to it, and frequently the best samples seen in Haddington market are of Fenton Wheats. The only variety of Wheat Mr. Hope has ever had to surpass Fenton in point of yield of grain is the Spalding Red, but the money-value of the former was at least equal to the latter. The farm of Fenton Barns is generally of excellent quality, composed of rich loamy clay derived from basaltic and porphyritic trap, and being in a high state of cultivation, the short, solid, firm straw of this new variety has given it a decided superiority over all other sorts. It is said that Fenton Wheat is apt to become mildewed on low-lying soft soils; but while this is true to a certain extent, it is an objection to which the long-strawed sorts are still more open. Fenton Wheat is, however, principally adapted for sowing on naturally rich or highly farmed land, and is not profitable when grown on soils where there is any difficulty in obtaining bulk of straw. The ear of this variety is of moderate length, but very square and evenly shaped; grain round, plump, and of a pale white colour. It weighs well in the bushel, and gives a great yield in proportion to the bulk of straw.

3. *Hunter's Wheat.*—This is one of the oldest and most esteemed varieties in Scotland. It was discovered about half a century ago by the late Mr. Hunter, Tynefield, near Dunbar, East Lothian, by the roadside on Coldingham Muir, Berwickshire. It is still largely cultivated in most of the eastern counties of Scotland, especially East Lothian, Fife, and Forfar. It has stood its ground against many newer varieties, which, although more prolific on their first introduction, have been found to deteriorate so much that their cultivation gradually lessened, and that of Hunter's Wheat increased. It is remarkably well suited to medium and inferior soils, being hardy and tillering very freely in spring, and continuing its growth steadily till autumn. In these respects it has been observed that while many of the newer and finer sorts of Wheat look better in winter and spring, Hunter's will, year after year, bear comparison with them, either in the sheaf, stack, sack, flour-mill, or baker's shelf. It is a great favourite with flour-millers and bakers, and its name to them is a sufficient recommendation to purchase, even although the sample may want the fine colour of the white sorts. Its physiological characteristics are medium length of straw and ear, the latter thickish in the middle, tapering to the neck and point, a little awned, and slightly running to a point; grain of a brownish colour, a little elongated in shape, but of a fine, hard, close, flinty texture, and weighing well in the bushel—sometimes as high as 66 lbs. when grown on hard land. It is fully later in coming to maturity than most of the white Wheats, and it should never be sown on fields surrounded by woods, as in such circumstances it usually suffers much from the attacks of fly. Neither should it be sown on rich alluvial soils in high condition, as it will grow too bulky, and go down before the grain is perfected. It must be confessed that Hunter's Wheat is neither so pure or of so good quality as it used to be, and considering the very long period it continued to maintain its high character unimpaired, this adulteration and deterioration are no doubt to be attributed to the introduction of so many new sorts, and consequent neglect of the older variety.

4. *Morton's Red Strawed White Wheat.*—This variety was introduced by Mr. John Morton, late of Whitfield Experimental Farm, Gloucestershire. Mr. Morton originally got two ears of Wheat from the Rev. Mr. Hearn, Hatford, Berkshire, both of which were very splendid, and contained upwards of 80 grains each. These were dibbled separately, 3 inches apart, in 6-inch rows. The Red Straw White Wheat produced a fine crop, and the second year there was as much as planted half an acre. The produce of the other ear was blighted and worthless. The name of Red Straw White Wheat was given to it by Mr. Morton, because the upper part of the stem assumes a purple or reddish colour before the grain becomes ripe. The characteristics of this variety are strong, tall, reedy straw, not apt to lodge; square, close ear of more than average length, and not liable to shed its seeds in high winds; white, round, plump grain when well grown, but open in the breast, and coarse in unfavourable seasons, or when cultivated on peaty soils. It is remarkably well adapted for all soils usually deficient in yield of straw. It naturally inclines to grow thin on the ground, and should therefore be sown a little thickly. When growing, this Wheat is easily distinguished from other sorts by its peculiarly dark green colour, and when nearly ripe by the reddish colour of the stem immediately below the ear. It is not so liable to mildew as most of the other white varieties of Wheat, but owing to its great length of straw it is not so well adapted for soft or peaty soils as the shorter-strawed kinds; not, however, so much on account of any deficiency of yield as from want of quality.

5. *Talavera (Bellevue) Wheat*—Selected by Colonel Le Couteur, Bellevue Villa, Jersey, from a field of the common Talavera, and first offered to the public in the autumn of 1838. Lawson describes it as a hardy sort; remarkably broad upright foliage, often yellowish in spring, but recovers rapidly afterwards; straw rather short and flexible, and brittle when overripe; ears loose, long, and tapering to a point; grain large, oblong, thin skinned, very white, and fine sample. Talavera Wheat is best adapted for sowing in spring, on black land or easy soils in good order; but is not a safe variety to sow on clay soils. When grown as a winter Wheat, it is rather short-strawed; but if sown in spring, the straw is generally sufficiently long to give a good bulk. Notwithstanding the beauty of the sample, it seldom weighs within 2 lbs. per bushel of what its appearance would indicate. It is probably the best spring Wheat in cultivation for that description of soils mentioned above.

Red Wheats. 6. *Spalding Prolific Red Wheat.*—This variety is the newest and best of all the red Wheats. No authentic account of its origin has yet been made public. From its name and character there is reason to suppose that it is originally from Lincolnshire, upon the fenny land of which immense crops of it are grown. The straw is remarkably tall, strong and stiff and not easily laid; ear long, square and free from awn; grain round, plump, and of a yellowish colour; yields remarkably well, and weighs well in the bushel. It is, however, a soft Wheat, and can only be sparingly used as a mixture with more flinty Wheats, when the flour is intended for the finer purposes of the baker. Spalding Wheat is well adapted for clay soils and for soft damp soils situated in a Wheat climate. It is a winter Wheat, but has been found to answer well on the eastern coast of Scotland when sown in spring. On the clay soils of the eastern district of Fifeshire it has been known repeatedly to produce eight quarters per acre. Sown, however, along with the old white Irish on a light trap soil, the latter invariably beat Spalding by fully 4 bushels per acre, while both were always superior to Hunter's variety.

7. *Piper's Thickset.*—Of this Mr. Piper himself has given us the following account:—"I found a remarkable ear in my field 10 years ago, and I cultivated it till I got about 40 acres. I then offered it to the public, more on account of its great yield than of its quality; though I still think it is better for the miller than the average of red Wheat. It was then, and, perhaps, is now, the shortest and stiffest-strawed Wheat in England. It is very thin-skinned, the bran from it being very light. It is more particularly adapted for good land, and hollow-bottom or meadow soils, where the crop is likely to be lodged or laid. In several instances it has grown 60 bushels per statute acre; but the farmers do not now grow it generally, as it does not grow straw enough to please them; and (which is certainly a fault) the ears are apt to break off at harvest time, if it is not cut early, though I do not know why farmers should not attend to their business as well as other people, and cut and cart it in proper time."

It would be easy to extend this list to any length, but we do not add any other detailed descriptive notices. We may, however, mention as an addition to the white varieties, that Mr. Haxton mentions a sort, which he calls the Old White Irish, as superior to many, both red and white varieties, in productiveness and in quality. We add of course that glad as we should be to assist our correspondents, we really cannot undertake the business of a seedsman, and that those having varieties of Wheat for sale must make it known by advertisement in the ordinary way.

THE PRINCE HALL ESTATE, DARTMOOR.

I had much pleasure in walking over Prince Hall Estate on the 8th inst. It is six years since I was there before. The change which it has undergone in this period is most wonderful. The whole surface was then covered with large blocks of granite, peat holes filled with water, and the only plants were Heaths and a few rough Grasses of the Carex family. All this has now disappeared, and in its place there is rich and luxuriant pasture in every inclosure, and the fields are covered with sheep and oxen grazing on them.

All the blocks of granite have been removed; those that were near the Dart have been hauled and placed along the side of the river, where they present rather a peculiar appearance; here they are placed close together, occupying a space of from 20 to 30 feet in width, closely covering the whole surface, and in some places they are piled on the top of each other; where it was too far to move these large stones to the river they were carried to build walls around the fields. These walls are of the most astonishing dimensions, some of them I found to be 6 feet wide at the bottom, 4½ feet wide at the top, and 6½ feet in height. The materials of which they are built are large blocks of granite; many of them are 4, 5, 6, and 7 feet long, 2, 3, and 4 feet wide, and 1 to 2 feet in thickness, forming a solid compact piece of excellent mason work; these walls were built of these dimensions merely to get rid of the blocks of granite which were so abundant on the ground. The cost of building these walls with such large stones was from 32*s.* to 48*s.* per chain in length; the labour of lifting these great blocks out of the ground and breaking them to such a size as to be rolled on a low four-wheeled truck was very great; in some instances where the blocks were very large and abundant, the gunpowder used to blast them cost 10*l.* per acre.

All the holes in the surface have been filled up—the land levelled, drained, and trenched, or trench-ploughed to the depth of from 12 to 18 inches; and the soil,

instead of presenting the dead black appearance of the peat, has now a dark brownish grey colour; where it is under cultivation all the natural plants have disappeared and all the land is laid down to pasture, except three fields which were in Turnips and Rape.

Where the land was being trenched the black peaty soil on the surface was carefully intermixed with the decomposed granitic gravel. After this the land was well cultivated, manured with guano, and it has produced in most cases two crops of roots and one of Oats, with which Grass seeds were sown for permanent pasture, and the land has been pastured by sheep and beasts ever since it has been laid down. It is Mr. Fowler's intention to let it remain in pasture as long as it will produce good keep for sheep and stock, which I have no doubt will be the case for many years to come.

The Clover and Italian Rye-grass sown last spring is now being cut the third time; it is a very close thick crop; the red Clover is in blossom, about 18 inches high, the Italian Rye-grass about 2½ feet high, and the soil covered with white Clover. Mr. Fowler informed us that this crop has kept five cows for 20 weeks per acre. The one-year, two-year, and three-year old pasture presents a thick, close covering of fine Grass, and the quantity of white Clover amongst it shows the quality of the herbage at this season of the year, and the quantity over the whole field is most abundant, although the fields are covered with sheep and oxen; I have not seen such pasture in any part of the country.

The cause of this rich luxuriant pasture is to be sought for in the perfect drainage of the land, and the intimate mixture of the peaty surface with the subsoil. From the nature of the various mineral matters which we have seen the granitic gravel is composed of, we may infer it has been the means of hastening the decomposition of the peaty soil (the humus of the French), thus giving nourishment to the roots of the Grasses; and the heavy dews and the mildness of this climate (for its elevation) may be the cause of the rich luxuriant pasture on this estate, surrounded, as it is, on every side by the barrenness of Dartmoor.

The estate has been perfectly drained, all the blocks of granite have been removed out of the soil, and carried off the fields; the land has been either trenched or trench-ploughed, and well cultivated and manured, producing excellent crops of Turnips and Oats, and is now laid down in permanent Grasses. Roads have been made through the estate, the farm-buildings and six large commodious cottages have been erected, and a large addition to the Hall has been made; all this has been done by the energy and ability of Mr. Fowler, in the short space of between three and four years. The result of this is most satisfactory, as it shows what the whole of Dartmoor may be brought to produce.

From Mr. Fowler's we went to examine the spade-farming at Princetown by the convicts. The plan which was adopted by Mr. Fowler is being carried out here, and report says that the authorities are indebted to Mr. Fowler for directing the mode of proceeding in bringing the moor in their neighbourhood into cultivation. We saw 250 of the convicts at work, trenching over the land about 16 inches deep, and lifting up the stones and laying them on the surface of the trenched land; the stones were small in comparison with those lifted by Mr. Fowler, none of them requiring to be blasted by gunpowder, and two or three men could easily roll over the largest of them. There is a large piece of ground before the workmen, perhaps 50 or 60 acres, which has already been trenched this year.

The ground near the prison (which had been previously cleared of stones, drained, and trenched) is now chiefly in root crop; that is, about 2 acres of it in Flax (which is short and not a good crop), 27 acres of Swedes and Mangolds, 7 acres of yellow Turnips, and 6 acres of Altringham Carrots. The only manure which has been used in producing the crops on these 42 acres is that from the privies in the prison, which is carefully collected, mixed with peat earth, and properly applied in the drills of the crop. The roots are a most splendid crop, many of the Swedes I found to be 8 inches in diameter; they are regularly planted over the field, and seem to be all of the same size. The seeds were sowed by hand, and are all at equal distances in straight rows, 27 inches apart, and in the rows the plants are 14 inches apart; this crop will be considerably above 20 tons of bulbs per acre. The Turnips, Swedes, and Mangolds are for food for the cows; the Carrots to be used in the kitchen on certain days for the table of the convicts.

There are some fields of Oats and Barley as food for the pigs and fodder for the cows; a field of Oats, not nearly ripe, but which they were mowing by the advice of Mr. Fowler, to be made into fodder for their stock; there is a pack of 30 cows to supply milk for the establishment. There were a number of men hauling a cart loaded with Barley from the field, but the grain is very light, scarcely anything but husks; this climate is not fit to bring Barley to maturity. Princetown is 1750 feet above the level of the sea. The farm buildings are on a good plan, and convenient. They were all built by convicts, and they present a specimen of excellent workmanship. *J. M.*

[We add to the above the report of Prince Hall estate, drawn up for Mr. Fowler, when he purchased it in 1847.]

This property is bounded on the north by the road leading from the Two-bridges to Ashburton, on the west by the fields belonging to the proprietor of the Two-bridges, on the south by the western branch of the river Dart, and on the east by the Cherry brook—a tributary stream to the Dart. The geological formation of this property is granite, formed of large crystals of felspar, imbedded in a ground composed of quartz and felspar intimately blended, having a strong decomposing tendency; there is a very small portion of mica in it, which is generally white, and, being in minute particles, it is difficult to distinguish. This granite may be called porphyritic, as the felspar crystals are large and well defined. The body in which they are imbedded is friable, and falls to pieces. This liability to decompose extends to a considerable depth in some places. When your buildings were erected, the whole mass was easily excavated; it had the appearance of decomposing granite before it was moved, but when excavated it formed a fine angular gravel, with large blocks of granite fit for building amongst it. The cause of this decomposition may be the influence of the atmosphere on the potash in the felspar, and on the iron interposed between the quartz and felspar. When the decomposition of the felspar is complete, china clay is formed, and the surface is a cold wet clayey soil; but on this part of Dartmoor the disintegration has only effected a separation of the materials which compose the granite, and a partial decomposition of the felspar and the iron. De la Beche calculates the granites of Devon, in which large crystals of felspar are disseminated, assuming the rock to be formed of 3-6ths of felspar, 2-6ths of quartz, and 1-6th of mica would be composed of—

73.04 parts of silica	0.44 lime
18.83 of alumina	1.73 oxide of iron
8.51 of potash	0.10 oxide of manganese
0.83 of magnesia	0.18 fluic acid.

The blocks of granite which are lying on the surface are formed from the decomposition of the softer parts, leaving the harder parts in immense irregular blocks, sometimes partly imbedded in the disintegrated mass, and sometimes these blocks rest on each other, forming tors, the softer parts having been washed away.

In most of the fields of Prince Hall estate, large blocks of granite appear partly above the surface, but particularly in two fields near the bridge they are lying on the surface in such abundance and so large, that it would be fruitless to attempt to clear them off the surface; there may be 50 or 60 acres so covered with these large granite blocks, so close together that it is frequently difficult to pass between them; but there is good sweet pasture for sheep between those that are further apart. Most of this estate is composed of this decomposing granite to a considerable depth, with hard blocks partly imbedded and partly above the surface. The whole of this friable mass is so porous as readily to let the rain water descend perpendicularly till it meets the solid granite, over which it runs to the lowest level. In this decomposed mass all the materials of the granite are in their natural position, but devoid of any adhesive property. When the rain water descends through this loose subsoil, and meets with solid granite, it is discharged on a level surface; peat is formed to a considerable depth over the level, and even when the declivity is not great, peat is formed over the whole of the elevated part of Dartmoor to a greater or less depth. On the lower parts of Dartmoor there is no peat over the decomposed ground, but as we ascend from Moreton Hampstead the peaty surface begins and increases as we ascend to the highest point. The growth of peat is owing to a cold, humid atmosphere, and stagnant water; and these elements increase as we ascend.

When the land is perfectly drained, and the peaty surface well incorporated with the upper part of the decomposed granite, it forms a good productive soil, and when the elevation is not above 500 or 600 feet it produces and ripens good crops of Wheat, Barley, Potatoes, and Turnips, as about Moreton Hampstead. The fertility of this soil is increased as the decomposition becomes more perfect, and its natural tendency is rapidly increased by the mineral means used in the cultivation of the arable land, incorporating the peat with the subsoil, so that a fresh surface of the mineral and vegetable matter is exposed to the oxygen of the atmosphere, which acts more readily on the potash and iron, and thus effects a more perfect decomposition.

The climate of Dartmoor is mild—very humid—strong heavy dews at night, and the number of rainy days averages 185. The mean temperature of Prince Hall may be about 48°, and the fall of rain averages 36 inches per annum. The elevation of Prince Hall is between 1100 and 1200 feet above the level of the sea.

The soil being friable and porous this want of adhesiveness (which cannot be supplied to it artificially, because there is no clay within reach) is made up by the humidity of the atmosphere, giving it a weekly supply of rain and a nightly supply of dew.

This soil is well fitted for the production of Turnips and Potatoes and other roots, as they require a friable soil, well pulverised, and a large supply of moisture during the months of June, July, and August; there can, therefore, be no difficulty in getting large crops of these on any part of your estate, but although a mild, humid atmosphere, is well calculated for growth of plants, and that large crops of Oats, and even of Wheat, have been produced on some of the cultivated parts of the moor; yet, as it requires dry, warm weather, with much sun during the months of June, July, and August, to ripen the grain, and as this is seldom the case on any part of Dartmoor, hence the failure of those who have attempted to produce Wheat, Barley, or Oats, except in such dry seasons as the last.

These peculiar circumstances must guide you in the cultivation of your land. The production of Turnips, Swedes, Mangold, Cabbage, Carrots, and Potatoes, is the principal object you ought to aim at. These will prepare the land to be laid down to pasture, and as the granite soil of Dartmoor is said to produce rich pasture for feeding stock, it ought to be your first object to get the whole laid down in clean healthy state for pasture. With respect to the cultivation of grain crops, the only one which you can attempt, with any prospect of profit, is the Oat; but as the end of autumn is generally very wet on the moor, you should make it a point (never to be deviated from) to get the whole of your Oat crop cut and carried by the middle of August, for although the crop may not be nearly ripe, it will make excellent fodder for your stock during winter, when cut into chaff and given to the beasts or sheep when consuming the roots.

Prince Hall estate consists of about 400 acres, it is partly enclosed by stone walls, about 30 acres have been partially cultivated, the remainder is in a state of nature. The whole of the land drains into the Dart on the south side of the estate; over the greater part of this land there is a thin surface of peat, from 3 to 6 or 8 inches deep, except where there are hollows; in these cases the water which runs out of the higher ground produces peat of greater thickness, and in one instance by the river, on the south-west side of the property, the peat is so deep as to be cut out and dried, and used as fuel. This part is the worst on the estate, as it is too deep to get through it to the decomposed granite below; for wherever you can plough or trench down through the peat, and mix it with the decomposed granite this mixture effects a rapid decomposition of the vegetable, of which the peat is composed, and it then produces the most luxuriant vegetation. The mode of cultivation best fitted to bring the soil of Dartmoor from its natural state to be productive and profitable, is first of all to perfectly drain the whole, then to clear the ground of the large granite blocks, and then to plough or trench the whole to the depth of 8 to 12 inches, so as to get as much in depth of the decomposing granite as you have of the depth of the peaty soil; this should be done during the summer; then, next spring, as early as the end of February or 1st of March, sow it with Oats, and apply say 4 cwt. of guano; this may produce a good crop of Oat straw, to be mown and made into fodder in August at the latest. After the Oats have been carried, then cross-plough the land as deep as you can, and by the spring the peaty matter will be much decomposed, and it will be easily cultivated for a Turnip crop, and there will be no difficulty in getting a good crop if you apply 20*s.* worth of guano. When the Turnips have either been eaten on the ground or carted off, the land should be limed, say 100 bushels per acre, and ploughed before winter, and in the spring you should put on all the dung you have for the next crop, which should be Mangold, Swedes, Carrots, or Potatoes; and by the cultivation of this crop the land will be in excellent order, and it should be sown in the spring of next year with Oats and those Grass seeds which will produce the most productive permanent pasture on such land natural to dry friable siliceous soil in a moist climate. (Messrs Drummonds, of Stirling, can furnish you with the necessary kind and quantity.) In this state the land should be pastured by sheep and by your whole stock, and it should remain in pasture, breaking up only the fields which produce little good Grass.

The expense of bringing this estate into cultivation, and of thus permanently improving it, will amount to a sum greater than the purchase money. It has been stated that there are 50 or 60 acres on which the blocks of granite are so numerous as to nearly cover the whole surface, which is to remain as it is, and there is about 60 acres of peat on the south-west side near the moor, which is also to remain; to these two fields may be added another more to the north-east side, over which the blocks of granite are so abundant that it would be advisable either to blast it or to let it remain as it is; this may be about 30 acres, so that there will be the remainder to act upon.

Of this, I believe there is about 200 acres that will require draining, which may cost 4*l.* per acre	£800
There may be 200 acres over which large blocks of granite are spread, which may cost 20*s.* per acre to break them ...	200
	£1000
Rolling and depositing stones on the river, or for building shelter walls around the fields, say 15*s.* per acre	150
Building division or shelter walls, say 6 feet wide at the bottom, 4 feet wide at the top, and 6 feet high, say 6*l.* for every 10 acres, for 200 acres	120
	£1270
The expense of building your barn, root house, boxes for your beasts, sheep, and pigs, dung-house and cart sheds	1500
Thus the expenses of permanently improving the land, and erecting the necessary buildings may cost...	2770
But besides this there is the expense of your working horses and implements, and the labour of cultivating the land till you get the whole laid down to permanent pasture, which may take you two, four, or six years to complete this, according to the amount of labour you can bring to bear on this mode of cultivation. The cost of the horses and implements may be equal to ...	£230
And the yearly labour and manure may cost you per year for four years	450
Thus a capital of	3450

will be required to do this. The increased produce of the land after it has been so improved will pay a good per centage on this expenditure over and above the original rent, which I believe was about 2*s.* 6*d.* per acre. *J. M.*

RAPE CAKE FOR FEEDING.

(*Concluded from p.* 635).

I now proceed to notice the doings of my fattening cattle under similar treatment. These will appear poor in comparison with those of the milch cow, though in comparison with other feeders, I think I may not appear to disadvantage. I have at times, and for a lengthened period, succeeded in effecting an average increase of 16 to 18 lbs. per week, though I cannot pretend to an equal average gain on the whole of my feeding stock. From a computation which I submitted to your readers in the *Gazette* of June 3 (No. 22), it appears that the whole of the gain is to useful material, and that beyond this there is an additional gain of internal fat, of 3 to 3½ lbs. per week, which occurs to the displacement of material in the process of evacuation. I see no reason to alter my views, or to doubt the correctness of this estimate. Basing my calculations on these data, and taking a favourable view of the progress of fattening cattle, I assume a gain of useful vendible material of 3 lbs. per day, or 21 lbs. per week. From observation on the habits of milch cows (which, on their yield of milk being diminished, and with a continuance of the same food, begin to gain in weight and condition), I am disposed to apportion a gain in flesh and fat somewhat in like ratio with what is shown in the casein, butter, and sugar of milk. I give this as conjectural, and invite the attention of those who make physiology their study to the subject. The analysis of the chemist on the excrements, repeated under the varying circumstances of yield of milk, and a gain of weight, would tend much to clear up a question of importance, and to which little attention has hitherto been given.

The gain of weight may then be assumed to consist of fat, and fat mixed with flesh	.75
Fibrine, .52; water with fibrine, 1.73 lb.	2.25
Gain per animal per day	3.00 lbs.

The gain in the fibrine of the flesh will represent the albumen of 1.76 lb. or not quite 2 lbs. of Rape-cake. I have stated that a number of milch cows, under observation from 16 to 33 weeks, fully maintained their condition, besides giving 14 quarts of milk per day, the proportion of casein in this milk is 1.68, and will represent the albumen of 5.70 lbs. of Rape-cake. Whilst in the process of fattening, and on like treatment, only .52 lb., or little more than ½ lb. of fibrine per day, are shown as gain, and which will represent the albumen of 1.76 lb. of Rape-cake. It is clear that the excrement of the fattening cattle will be richer and more valuable than that of the milker, yet it should be borne in mind that the elements of food obtain their highest value when adapted for the use of man. A pound of beef, reckoned as dry material, will cost 9*d.*, a pound of milk reckoned as dry will cost 1*s.*, when new milk sells for 2*d.* per quart, at which price it enters largely into consumption for food, whilst as manure their value will be less than a halfpenny per pound. It is then obviously the interest of the farmer or feeder to convert as much of his material as possible into food for man, and to increase the quantity rather than enrich the quality of his manure.

In the extensive district of Craven, in Yorkshire, which is in permanent Grass, it is quite customary to supply cattle during winter with hay and water only. It is found that with 20 to 24 lbs. per day, according to their size, full grown cattle for store purposes will

fully maintain their condition. With a yield of milk, 14 quarts per day, it would require 20 lbs. of hay, in addition to supplying the due proportion of casein, making together upwards of 40 lbs. per day, a quantity you could not induce a cow to consume. I have seen it stated, as the result of experiment, that 120 lbs. of Swedish Turnips per day are required to maintain the condition of an animal. If we add to this 36 lbs. to furnish the supply of albumen for the gain of .52 fibrine in fattening, it will make 156 lbs. per day, which is about the quantity usually consumed by fattening cattle. This seems to corroborate my apportionment of fibrine to fat, &c., in feeding. To supply a full yield of milk with the due proportion of casein would require in addition 112 lbs., making 232 lbs. per day. Though a cow might probably be induced to consume this quantity of Turnips, yet from the excess of water (near 100 lbs. per day more than is required) the quantity of milk would be increased, while its quality would be proportionately reduced, and its flavour would be disagreeable. From what I have stated, it appears plain that food, rich in albumen, has a high value for the production of milk. I here give analyses of those materials most commonly in use, made by Professor Anderson, and published in the Journal of the Royal Highland Society :—

	Linseed Cake.	Rape Cake	Beans.	Bran.
Water	12.44	10.68	15.84	12.85
Oil	12.79	11.10	1.59	5.56
Albumen	27.69	29.53	24.70	13.80
Ash	6.13	7.79	3.36	6.11
Other constituents.	40.95	40.90	54.51	61.68
	100.00	100.00	100.00	100.00
Phosphate of lime	2.73	3.87	.49	...
Phosphoric acid ...	.55	.39	.46	3.00

Those who attend to the teaching of chemistry will give the first place to Rape-cake. It is the richest in albumen, and also in phosphate of lime—both essential components of milk. It will also appear plain that more of food rich in albumen is required for the production of milk than for fattening ; the proportion for a full yield of milk being 1·68 lbs. per day casein, which requires 5·70 lbs. Rape-cake ; whilst for fattening, only ·52 lbs. fibrine, which requires 1·76 lbs. Rape-cake : but this is not the only difference. In the process of milking there is a continual drain on the albumen of the food, whilst in that of fattening the tendency is to repletion of the fibrine or flesh ; when this has acquired its full development, no portion of the albumen of the food will be retained by assimilation in increase of fibrine ; the requirements of albuminous matter in food will then be limited to what is requisite for the maintenance of the flesh. A comparison of the two processes of producing milk, and of fattening, show the remarkable result that by the former, though at a somewhat greater expense of food, you may provide three times the amount of nutriment fitted for the use of man as by the latter. As flesh contains fully three-fourths of water in its composition, if you carry out the like proportion in the increase by each process, the result by fattening would show a gain of 9 lbs. per day, or 63 lbs. per week, an amount it seems impossible to attain.

Perhaps no agricultural subject has excited more attention and discussion than the qualities and value of materials for food. Boussingault and other celebrated writers have published tables of the theoretical values of different materials derived solely from their proportion of nitrogen, giving the highest value to such as contain the greatest per centage of this element. Consideration will, however, teach that highly nitrogenous food has a greater value for special or particular than for general purposes. If you examine the composition of milk, taken as dry material, it has the highest proportion, nearly 40 per cent., of nitrogenous compounds ; yet as food for building up the frames of young animals, neither experience nor science has been able to devise any substitute of equal efficacy. I have shown, too, that food rich in albumen has a special value for the production of milk ; it has likewise a special value in making good the deficiency of materials of food which do not contain a due proportion. We find that Swede Turnips which contain about 16 per cent. of albumen in their dry material fatten satisfactorily ; that the rich pasture Grasses, which have a very similar proportion, have the like effect. We find that meadow hay, with its 6 or 8 per cent., maintains, but does not fatten, whilst on straw, with 1½ per cent. of albuminous matter, cattle exist for a time but do not thrive. The deficiency in these can be supplied only by materials rich in albumen. In addition to my cattle, I maintain about 50 lambing ewes, which I purchase in October, and also shearlings. To the former, which drop their lambs in March, I likewise give Rape-cake. I commence this practice during the winter, and continue it throughout the season. At the commencement I supply it in small quantities, with a sprinkling of Oats; now and then an ewe is seen to nibble by degrees, and after a lapse of some weeks they also get accustomed to it, and eat to the extent of ½ to ¾ of a lb. per day each. As the composition of sheep's milk resembles that of the cow, I need not remark on its adaptation to the purpose.

Being engaged in the business of keeping cows for dairy purposes, and likewise for fattening, of which latter I send out 50 to 60 per year, the comparative effect of the two processes on the fertility of the land in my occupation has engaged much of my attention. On the rich feeding pastures of this district cattle graze from year to year, and for a long series of years, without any perceptible diminution of their fertility. The cattle for this purpose being well-grown animals, their increase will be to flesh and fat; and, reckoning the same rate of increase as above noticed, each beast will carry off in flesh the nitrogen equal to what will be supplied by 3 cwt. of oil-cake or Beans. This appears to be fully restored through the agency of the atmosphere. The effect of dairy produce is known to be very different. In Cheshire and other cheese-making and dairy districts it is found necessary, with a view of maintaining the fertility of the pastures, to apply a top-dressing of bones, rich in gelatine and phosphate of lime, every 6 or 7 years. It has been shown that, in a full yield of milk, more than three times the quantity of nitrogenous matter is contained than can be assimilated in the increase of beef ; besides which, milk carries off a considerable quantity of phosphate of lime and other mineral matters. The amount of nitrogen removed by a cow giving 3½ gallons per day carries off the nitrogen of 5.70 lbs., or for the half year 9 cwt. Rape-cake ; 2 gallons per day carries off the nitrogen of 3.25 lbs., or for the half-year 5½ cwt. Rape-cake; whilst the nitrogen assimilated by a fattening beast requires only 1.76 lb. per day, or 3 cwt. per year to replace it. It is to be observed that a cow on rich pasture, giving only 4 quarts per day, will gain flesh likewise, and carry off nitrogen in addition. The analyses of Rape-cake show about 4 per cent. of phosphate of lime and phosphoric acid. A full yield of milk will require 2 lbs. per day, or 3 cwt. 36 lbs. for the season, to restore this element of fertility. It will be remarked that no part of this is supplied by the atmosphere.

I have shown by my treatment of milch cows that I am able with a full yield of milk to maintain their condition. I hold it equally desirable to keep up the fertility of my pastures. Since I began the use of Rape-cake I am effecting more than this—they are gaining from year to year in productiveness.

In the woollen manufacture, shoddy or refuse wool, which was formerly sent to Kent as manure, is now sorted over and a great proportion of it is retained for again working up into new materials. In the cotton trade, what was formerly looked upon, and termed waste, is now cleaned from its filth and manufactured into stout cloths for export, some of them probably to the very remote countries in which the cotton was produced. Agriculture is, in this respect, far in arrear; a great waste, not only of material of food but likewise of material to produce that food, is daily occurring. *Y.*

Home Correspondence.

Profitable Cows.—A cow kept here gave, just after calving, 30 quarts of milk per day, and 16 lbs. of butter per week ; and at the end of 13 weeks after calving she gave 11½ lbs. of butter per week (the milk was not measured). Although the weather was cold and wet in both cases the cow was at Grass. Do you know many instances where this has been exceeded ? And is not such a cow more profitable than a high-bred shorthorn ? *T. G.*

Tartarian Oats.—I have observed various paragraphs of late containing intimations of remarkable produce ; the greatest of which, however, that has come under my notice scarcely exceeding 200-fold. I beg leave to send you a stalk of the black or Tartar Oat, on which younger eyes than mine have counted 265 pickles. It was plucked at random, amongst hundreds of others in the same field, bearing not less than 200 commonly ; nor do I despair of finding a head with 300 yet. I may remark that it is the produce of rough ground newly drained in the higher parts of Linlithgowshire, at least 450 feet above the sea level. It would be curious if your readers would record or evidence their observations as to the highest bearing powers of the different kinds of grain. *Robert Stewarte, Westwood, West Calder.*

Wheat, early sowing.—"We also sowed a small plot last July, which proved productive in a superlative degree, with ears surpassing any we had ever seen before, but unhappily the birds devoured it all, notwithstanding it had been netted to protect it. It stood the winter well." *Hardy and Son, Maldon, Essex.* This I find in the *Agricultural Gazette* for Sept. 9, 1854. I had heard in the early part of the present century they used to sow Wheat in Hampshire in August, with old Wheat, before harvest. Having at that time a greater breadth of Wheat to sow than usual, I had a field of 24 acres, which was in summer fallow ; it was a genial season, the land was clean, I think it had been three times ploughed, and it lay in such manner as I thought it was a pity something was not growing upon it ; I had a stack of red Wheat, clean and sound (though not very heavy), out of which I sowed the 24 acres ; so it was done in a moment (comparatively). I got a threshing machine, so we got enough to sow the field in a day, and began the next. I think we were 4 or 5 days drilling the Wheat at 6 inches. The first day was the last of July (there was Sunday between), and the weather got drier, and it did not do so well after ; but it got to be so as to astonish every beholder (for there was a footpath through it), and it appeared at a distance like a rich eddish before harvest. I often had my fears lest it should prove a failure, but it was poor land (woodland clay) ; on that account it did not get winter proud, and when threshed I found it as good a sample as I ever grew. The spot where it grew was about five miles south of Huntingdon. The next, I sowed 5 acres in August, and that was a fine sample ; this was in the year 1819-20, or thereabout. Remember, this was only a freak of mine, and I do not put any confidence in the plan, so as to recommend it generally ; for I think October is the favourable month for Wheat-sowing in Huntingdonshire and its vicinity. *James Hall, 62, Rutland Street, Chorlton-upon-Medlock, Manchester.*

Bountiful Harvest, its causes.—Without using so many hard words, unintelligible to some readers, we will just advert to the causes which we pointed out in the spring as likely to be conducive to an universal and larger growth of corn than in ordinary seasons. Anomalous as it may appear, the very circumstance of a bad seed time and indifferent seed, consequently resulted in a thinner and somewhat more regular and promising plant than the many full plants from ordinary thick sowing. This, accompanied with a very dry and cold March (without which all hopes are lost for a full crop of Wheat) led us to infer that extraordinary and unusual crops might be expected. We also noticed, that unless more corn were grown in this country by "hook or by crook," to compete with the foreigner, the exigencies consequent on free-trade, and a dependance on foreign supplies, would be often severely felt ; and we have reason to fear that, under present circumstances, such will be the case during the ensuing year, notwithstanding the late bountiful harvest bestowed upon us by the Disposer of All Good. What, then, must have resulted from so deficient a crop, and so small a breadth sown as in 1853 ? Waste in corn will form the substance of our future remarks, which we trust will be acceptable in these columns. *Hardy and Son, Seed Growers, Maldon, Essex.*

Miscellaneous.

Comparative Merits of different kinds of Wheat.—Having just concluded my annual experiments on the comparative merits of different varieties of Wheat, I must again beg your permission to insert the following statement in the next number of your paper, as I believe many of my friends are anxious to see it. If it should be thought that my produce in some respects is large, I beg to say that my experimental pieces of Wheat were grown on very good land, and in the middle of a field on small plots of about a rood each ; that no hedges, banks, nor roads were measured in, neither was the Wheat in consequence injured by birds or vermin, so that when I give the result of a plot of land producing 50 bushels per acre, it must not be supposed that a whole furlong or field would produce anything like that quantity. I mention this, lest persons adverse to the farmer should think there is a larger yield of Wheat this season than there really is. I began my experiments last autumn on the 12th of October, by drilling at 8 inch intervals the following sorts of Wheat, on plots of land containing about 25 perches each, at the rate of about 7 pecks of seed per acre, after a White Clover ley, which had been summer eaten by sheep. I found the result to be as follows :—

Experiment No. 1.

	Quantity per acre.	Value per Qr.	Value per acre.
	Bush. pk. gal.	*s.*	£ *s.* *d.*
Improved Browick Red	52 1 0	52	16 19 7
Spalding Red	48 2 0	52	15 15 3
Overman's Red.....	49 2 1	52	16 2 6

On the same day, and in the same manner as the above experiment, and also on land which had borne a good crop of White Clover during the summer, were drilled at the rate also of about 7 pecks of seed per acre, the following varieties of Wheat—

Experiment No. 2.

	Quantity per acre.	Value per Qr.	Value per acre.
	Bush. pk. gal.	*s.*	£ *s.* *d.*
Albert Red	50 1 1	52	16 7 5
Improved Browick Red	53 0 0	52	17 4 6
Golden Drop Red.....	51 1 1	53	17 0 3
Lammas Red.....	47 1 1	53	15 15 10
Prima Donna Red	43 3 1	53	14 0 8

As I generally sow a considerable portion of land with white Wheat, I made another trial to see whether any sort of white would beat in value per acre my old and favourite sort, the Imperial White. I therefore drilled, on a piece of land contiguous to Experiment No. 2 the following sorts of Wheat, at the rate also of about 7 pecks of seed per acre. The undermentioned statement was the result—

Experiment No. 3.

	Quantity per acre.	Value per Qr.	Value per acre.
	Bush. pk. gal.	*s.*	£ *s.* *d.*
Imperial White	47 3 0	59	17 12 2
Imperial White	45 3 0	59	16 17 5
American White	44 1 0	60	16 10 0
Brown Straw White	42 2 1	58	15 9 0
Prima Donna Red	43 3 1	53	14 0 8

These experiments were all made in a field where the land was very good, of a deep gravelly loam, and in a fair state of cultivation, which accounts for the great produce I have this year. The prices I have given as the value per quarter for the Wheat is what I consider it is now worth to the miller. The markets, however, are so fluctuating that I do not know that I have stated them correctly. It is of little consequence, provided that the relative value of each sort is properly given, which I have endeavoured to do. These trials show a great difference in value per acre, as much as 3*l.* 11*s.* in one experiment, and 2*l.* 6*s.* per acre in another, where all the Wheat was of the red kind. I have

grown the Browick red six seasons, and the imperial white 10 seasons, and they still seem to keep the pre-eminence. I scarcely, however, know which of the two sorts is the best, therefore I cultivate both. Without trespassing any further on your columns, I am, sir, your obedient servant, *T. E. Pawlett, Beeston, Biggleswade, Sept.* 14 ; *in Bell's Messenger.*

Death of Mr. Wingate, of Hareby, near Spilsby, Lincolnshire.—We are truly sorry to hear of this event, which took place suddenly, and partly as the result of accident at Hareby House, on the 29th ult. Mr. Wingate was well known in the agricultural world as an energetic member of the Agricultural Society of England. He was especially known in his own county as a skilful agriculturist, a man of thorough honesty, of clear-sightedness, and resolution in public life, and of fast and warm-hearted friendship in the large circle among all classes of society by whom he was known and valued as a personal acquaintance.

Calendar of Operations.

OCTOBER.

WEST SUSSEX, *October* 3.—We are still able to report such dry weather as no one ever remembers before. We had a little rain about two weeks ago, just enough to make the Trifolium come up well, which it has done everywhere, and thicker than I have seen it for a long time. I do not think its appearance differs much, if any, where it was ploughed for, and where not. I believe if the land is ploughed for it, and left lying light, it will not do so well as where not ploughed, as all Clovers like a firm soil, but when ploughed it should be well rolled down before the seeds are sown, and then, I think, it is better than sowing on the stubble, as all the rubbish is buried below, and nothing remains above to check the seeds; but though it has all come up, it is again at a stand-still with the dry weather. But the worst is the Turnip crop, which is going off fast, especially those sown earliest; they are rotting, and have an appearance as if they had had hot water poured upon them, whilst those that were sown later are not yet so bad, as the little rain that we had came in time to save them for the time, before they had got too ripe; but there are symptoms of their going too. Swedes do not go so rapidly, being of a slower growth, but they are all very much affected by mildew, and will be far from a good crop; and now that we have to provide our winter flock from the great Hampshire fair, we may expect to have them much cheaper than they were last season, for there cannot be so many kept as usual. Every one is providing as much artificial spring food as possible, so as in some measure to supply the place of Turnips; and the season has been well adapted for clearing the Wheat stubble for that purpose. Wheat sowing has not yet begun, but the preparation is going on rapidly, and in some instances is far advanced. Cattle and sheep still do well, though feed is so short, but the cattle have to be assisted in the straw yard, and sheep have a little corn or cake. Our market is not well supplied with Wheat, and were it not for the steam engines, for which the weather is so favourable, it would be much more. They have been very busy since the harvest was in, and though they have been but little in this locality before, they now seem to have got hold of the farmer's favour, and whether they will turn hands out of work, we cannot say but all work is in a forward state, and on that account fewer hands will be wanted; already there are numbers discharged. Our work now is to get all the land for Wheat ready, and we may expect that it will be all put in early. We can hardly speak of how the last crop is likely to yield, as we have not got out enough to be sure, but from what we hear, it seems to turn out well. *G. S.*

Notices to Correspondents.

CUMBERLAND AGRICULTURAL SOCIETY: We regret being unable this week to give a report of the meeting of this Society; we hope to do so in our next Number.

MANGOLD WURZEL: *C.* We have often noticed a blighted black cankered sort of appearance in the heart of the leaves, which get yellow and black, and are eaten away down to the bulb; but this generally is unaccompanied by any softening of the bulb, which is unusually hard and woody under it. We therefore are uncertain of your case; the semi-transparency you name does look like the commencement of putrefaction.

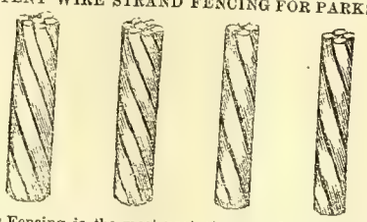
PERRY: *A Subscriber* asks for instructions for making perry in small quantities, which we do not find among our very limited reference to such subjects. Perhaps, therefore, some reader will kindly answer his inquiry.

WHEAT: *Several Readers* have asked for Bristol red and Browick red Wheat. We are unable to assist them; and any inquiry which we now make for them must be answered in the advertisement columns.

(ADVERTISEMENT.)

THE "NE PLUS ULTRA" WHEAT.—For several seasons past, much interest has been excited in this neighbourhood in the result of experiments made by Mr. Harradine, of Needingworth, near St. Ives, Huntingdonshire, in the growth of a new description of Wheat, and which if "it giveth forth its increase" at the rate of multiplication that has attended it hitherto, bids fair to create a revolution in the agricultural world. One ear of it was sown in 1849 on the land of Mr. Harradine, and the produce of this again in 1850 and 1851, when it yielded at the extraordinary rate (especially for those years) of 19 coombs 1 bushel and 1 peck per acre. It has been sown, on almost every available description of soil, and introduced in every imaginable change of crops. It was sown after Tartarian Oats, Clover, seeds, Peas, and Tares, on soil of various compositions, fen and Highland: in all cases the quantity of seed was restricted to 4 pecks per acre, but the result was the same, the yield reaching that previously realised by Mr. Harradine. It has been sown after Wheat, Clover, Barley, Beans, Oats, and fallow, and sustained its reputation through all these trials; it has been sown in winter and in spring, drilled, broadcast, and dibbled, with the same results, some put in in February showing no diminution in the yield. The preparation of the land may be the same as for ordinary Wheat, and the same rate of increase in the yield over ordinary sorts may be expected. With all these facts in view, and there are numbers of gentlemen ready to verify them, Mr Harradine is fully justified in naming this Wheat the "Ne plus ultra," worthy as it is of being the chief occupant of the cornucopia of Ceres. Specimens have been forwarded to us for inspection; and if we may judge by the number of standards and ears springing from one root, we cannot doubt that the yield is as described. One kernel set by Mr. Harradine produced 25 standards; and this root, with a similar number of ears and their multiplicity of kernels, may now be seen at the stand in the Crystal Palace of Mr. Mechi, the patron of all that is new, interesting, or beneficial in agriculture. It will be seen by advertisement that, with a most creditable single-mindedness, Mr. Harradine has resolved to throw open the benefits of his discovery to his brother agriculturists: and when the trouble and expence Mr. Harradine has been at in the propagation of such a quantity of seed as would warrant him in offering such a boon without a chance of disappointment to the applicant, coupled too, with the fact that up to the beginning of this harvest not a single kernel has been sown for seed, be considered, the price must be taken to be a very low one.—*Cambridge Chronicle.*

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

CHEAP WIRE GAME & POULTRY NETTING, 5*d.* per running yard.
GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

	Galvanised.	Not Galvanised
24 in. wide, 2 in. mesh,	7*d.* per yard.	5*d.* per yard
30 in. „ 2 in. „	9*d.* „	6½*d.* „
36 in. „ 2 in. „	10½*d.* „	7½*d.* „
48 in. „ 2 in. „	1*s.* 2*d.* „	10*d.* „

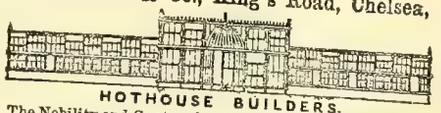
Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. Fox, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

ENCAUSTIC TILE PAVEMENTS.
MAW AND CO., Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "THE SUCCESSFUL IMITATION OF OPY'S ALEXANDRINUM, IN THE BEAUTIFUL ENCAUSTIC TILE PAVEMENT OF CLOISTERS OF BYZANTINE COURT," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.
Specimens at 11, Aldersgate Street, City.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, ENGINEER, Battersea.

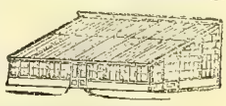
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds. &c., forwarded on application.
J. WEEKS & Co., King's Road, Chelsea, London.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

SAMUELSON'S PATENT PRIZE FORKING MACHINE
(*Silver Medal from the Royal Agricultural Society of England, Prize from the Yorkshire Agricultural Society, Prize from the Cleveland Agricultural Society, do. from the Worcestershire Agricultural Society*),
Is now proved by experience to be an invaluable implement for deep tillage, and equally effective as an extractor of Couch Grass, and other Weeds, in testimonial of which, numerous reports from farmers using it in every part of the kingdom may be had on application. Various imitations have failed, through the absence of its essential feature—the Patent Fork. The amount of horse power is less in proportion to the surface deeply pulverised than that required in the ordinary shallow ploughing. The application of steam power to tillage is still a problem to be solved, and it is not necessary to defer deep cultivation until its solution be accomplished.

SAMUELSON'S
IMPROVED GARDNERS' TURNIP CUTTER.
Prize for the ninth time, at the Royal Agricultural Society's Meeting, Lincoln, 1854.
The improvement is a rasping plate for loosening and voiding dirt from the roots, whilst being cut, whereby the scouring tendency of root feeding is diminished.
B. SAMUELSON (Successor to the late Mr. Gardner),
Britannia Works, Banbury.

COTTAM AND HALLEN,
2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.

APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.
AGRICULTURAL LIST UPON APPLICATION.
EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.
EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

[The following Report was unanimously passed at a General Committee Meeting on the 3d of October, 1854, the Right Hon. the Earl of Effingham in the chair :—]

FIRST HALF YEARLY REPORT OF THE CENTRAL ASSOCIATION.

THIS ASSOCIATION originated at the National Club on the 24th February, 1854, and was joined on the 25th February by a Deputation from the Army and Navy Club. It was formally instituted at a public meeting held in Willis's Rooms on the 7th March, 1854, (the late deeply lamented General Sir Peregrine Maitland, G.C.B., in the chair,) and has now completed the first half-year of its operations.

The vast amount of undeserved misery that this Association has been the means of alleviating during the past six months, induces the Committee to make a half-yearly Report of their proceedings; and this, not only to show that the noble efforts made by the country on behalf of the silent sufferers has not been a fruitless one; but also to direct public attention to the urgent and absolute necessity for the establishment of some permanent National Provision for the Wives and Families, Widows, and Orphans, of our soldiers.

Case 490, *Mrs. B.*—Wife a serjeant of the 38th. Married with leave. Left destitute with six children, after she had spent the small sum her husband left for her. Five of her children provided for; the sixth being an infant, and the mother being weakly, she received a weekly allowance of 5*s.*, until she obtained work as a washerwoman, for which the Association furnished the means, and she now earns her own livelihood, assisted by her two boys, aged 12 and 13, for whom situations as pages have been found.

Mrs. E. F., 8th Hussars.—A most respectable person, married with leave, in delicate health. Left destitute with six children. Earns a little by washing, for which a donation of 2*l.* was granted. A weekly allowance of 7*s.*

Case 439, *Mrs. W. H. R.*—Wife of a private, 13th Light Dragoons. Married with leave, left destitute with four children. A most respectable person. A situation as cook obtained for her, and all her children provided for.

Case 73, *Mrs. S. J. G.*—Wife of a serjeant in the 21st Regiment. Married with leave. Left destitute with four children, and expecting her confinement. A weekly allowance of 5*s.*, in addition to the parish out-door relief of 3*s.* a-week and four loaves.

Case 460, *Mrs. W.*—Wife of a lance-serjeant in the 6th Dragoons. Married with leave. Left destitute with 3 children, and expecting her confinement. A weekly allowance till she became a widow, when she was granted 8*l.*, and one of her three children provided for by the Birmingham Local Committee.

Case 193, *Mrs. E. H.*—Wife of a private in the 38th Regiment. Married with leave. Left destitute with 4 children. One child provided for, and a weekly allowance of 7*s.* a week.

Case 384, *Mrs. A. F.*—Wife of a private in the 77th Regiment. Married with leave. Left destitute with 5 children. A weekly allowance of 10*s.*

Case 433, *38th Regiment.*—Mrs. A., the wife of a serjeant. Married with leave. Left destitute with 4 children. Has been provided with a situation at 14*l.* a year, and all her children taken care of by the Association.

Mrs. E. F., 63d Regiment.—Married with leave. Sixteen years wife of a private. Left destitute with 5 children. A weekly allowance of 7*s.*

Mrs. E. T., 46th Regiment.—Married with leave. Left destitute with 5 children, under 10 years of age, unable to leave her infant. A weekly allowance of 7*s.*

Notwithstanding all that has been said and written on the subject, the fact still remains in all its sadness, that for the wife and family, widow and orphan, of our best-behaved soldiers, whether non-commissioned officer or private, no provision whatever is made. Nothing but private charity keeps them from pauperism when their husbands and fathers, are taken away.

The marriage of these good men is fully permitted by military authority; it is even granted as a reward for good conduct, and yet should they be ordered to the seat of war, or die in the service of their country, their families are cast aside in utter destitution and desolation. To prove that this is no over-statement, the Committee have selected a few cases out of hundreds, all of which are those of wives of non-commissioned officers and privates, who, having been married with military sanction and approval, had been placed on the strength of the regiment.

Mrs. T. L., 28th Regiment.—Married with leave. Wife of a serjeant. Left with 5 children. Her husband left her some little money and his watch, to part with in case of need. The watch had been parted with, when this Association helped her out of all her troubles, and she regularly receives money from her husband.

Mrs. E. B., case 321.—Wife of a private, 88th Regiment. Married with leave. Left perfectly destitute with 5 children. The two youngest, twins, born since her husband left. In very bad health since her confinement. A weekly allowance of 12*s.*

Cases Nos. 406, 407, 408.—The wives of privates of the 55th. All married with leave. Left destitute with 10 children. A weekly allowance to each.

Case No. 968, *Mrs. C. B.*—Wife of a private, Royal Artillery. Married with leave. Left destitute with 6 children in great distress. A weekly allowance granted.

Case 971, *Mrs. A. C.*—Wife of a serjeant of the 38th Regiment. Married with leave. Left destitute with 6 children. A weekly allowance of 12*s.*

Case 592, *Mrs. T.*—Wife of a serjeant of the 11th Hussars. Married with leave. Left with 6 children Eldest daughter provided with a situation, and a weekly allowance of 10*s.* to her mother.

This dreary catalogue of destitution might be continued almost to an endless extent, and all the harrowing details accompanying each case might be given; but the Committee are satisfied that a simple statement of these facts is more than sufficient to prove the need for, and the reality of their work. It is true that the parish of the soldier may be compelled to support his wife and family; but the Committee would ask whether the workhouse is a fitting place for the families of men who can write such letters as the following:—

"Camp near Varna, August 30th, 1854.

"Sir,—I sincerely trust that I may not offend you by the liberty I take in addressing you; but having heard of your kindness to the wives and children of soldiers now serving in Turkey, I am induced to request your kind assistance on behalf of my little daughter. By the last mail from England I received the melancholy intelligence of my wife's death, which occurred on the 9th of August, leaving my little girl entirely unprovided for, &c. I therefore humbly hope that you will kindly cause inquiries to be made, so that my child may not be left entirely unprotected or uncared for. I will most gladly contribute, as far as my means will admit, to defray any expense which may arise in placing her in any establishment which you select. We expect to embark for Sebastopol to-morrow, consequently I feel very anxious that some steps may be immediately taken to provide for her.—I remain, sir, most respectfully, G. H., Sergeant."

"To Major the Hon. H. L. Powys, 60th Reg. Rifles, Hon. Sec."

The wife and child of this non-commissioned officer were entirely supported by the Association until his wife died of cholera in London. His daughter is now comfortably settled at the Industrial School at Birmingham, at the expense of the Association; and when thoroughly trained and educated, will be provided with a situation by the managers of the Industrial School.

"Devno, in Turkey; July, 1854.

"My Dearest Mary,—I know you will be glad to have this letter from your dear father. I hope and pray Almighty God that you and your dear little sisters are quite well and happy and comfortable. Give dear Fanny and dear little Margaret my very best and fondest love, with many kisses also to your little companions. I have not been yet where the 38th Regiment is. When I see the regiment, I will be sure to go and see their fathers. I hope you are well and happy altogether, and love each other, and be kind to one another. But, my dear child, you must look after and see to your youngest sister, for she is but a baby yet, and may God bless you all and keep you under His Almighty wings, always, is the daily prayer of your loving father. Be kind to your dear sister Fanny; kiss her for me, tell her I send my very best love to her, and she is to learn all she can till I come home, which I trust, please God, won't be long. I hope you are all good children, and do what you can to assist Mrs. B., who will, I know, be very kind and good to you. I hope she is quite well. Give her my best respects. I hope you love and obey your teachers. You must write to me, my dear Mary, &c. &c. We are all in a very large camp. I dare say 10,000 men. We all sleep on the ground. We have our cloaks and one blanket to cover us. There are no houses near us for miles. We all went to a little valley yesterday, and heard Divine Service, and very many of us received the Sacrament of our Lord Jesus Christ afterwards. Oh! my dear child, never forget your prayers, and be a good child, and you will have God for your father and friend for ever. Pray for your dear sister; pray for your father, and God will hear you. He will bless and keep us always, and bring us to heaven at last for Jesus Christ's sake. And now, my darlings, good bye, and may God bless and take care of you all is the prayer of your loving father, T. D."

Letter addressed to the Honorary Secretary of the Dublin Association:—

"September 2, 1854.

"Sir,—Only for the relief I received weekly from you, I would have been obliged to go into the workhouse, with my two children, which would have been worse than death to me; for if we were dead, our miserable existence would be ended here. I could not have maintained myself and children only for it, though I worked day and night to do so, and tried every means in my power, yet I found it was impossible. I was making shirts for Gilpins, in Molesworth Street, at 5*s.* per dozen, and I could not complete the dozen in a week; so if I had not had that relief, what should I have done? I never received any money from my husband since I left him, nor had no one to ask me or my children to have a meal of victuals since I lost my only friend—my dear husband. And now, through your kindness and interest, I have got a situation; and if you did not still allow me a little to pay for my children, I should not be able to remain in it, as I have not enough wages to pay for them and clothe myself and them. I hope God will reward every one who has so kindly helped the poor soldier's wife and child; for most of us have been thrown out of a comfortable home, to face a frowning world. I hope the Lord will reward you also, sir, for the kind interest you have taken in the soldiers' wives, &c.

Mrs. J."

Many more letters might be quoted, showing how grateful these fine fellows are for the care that has been extended to their wives and children; but quite enough, it is hoped, has been stated to satisfy the Committee that they not only are doing what is right, but that it is the bounden duty of England to carry out the work that has been thus happily commenced. Nor are the poor women themselves ungrateful for all that has been, and is doing for them. With a few exceptions, all have evinced the greatest thankfulness, and readiness to find employment for themselves. Two wives of soldiers who had been temporarily relieved with weekly allowances, offered to repay the Association as soon as their husbands remitted money; and one of them, directly she received a remittance from her husband, insisted on repaying a sovereign to the Association, saying at the same time, "That there was many a poor soldier's wife who needed it more than she did." More than 200 have been placed in situations as housemaids, cooks, nurses, washerwomen, &c., and, generally, have given satisfaction; one of them writes thus to the inspecting officer:—

"Sir,—According to promise, I now let you know how I am getting on. I never was so happy in all my life. I have indeed a kind master and mistress; they look to my comfort in every way; I might well say, it is equal to my own home. I only wish to God that more of the women were so well provided for as I am, sir. Will you return the Association thanks in my name, for their kindness to me and my child; also for the 10*s.* I have received, with which I have bought some clothes. I hope that I will keep my situation a long time. The lady seems to like me very well, and she says that anything in her power she will do to promote my comfort. With my sincere thanks to you for your kindness, Your obedient servant, E. D."

Many women, natives of Nova Scotia and Canada, on being provided a passage by Government to their own country, have been granted a donation of 3*l.* each, to provide them with comforts for themselves and children during the voyage. To 17 women of different regiments, all married with leave, has the Association been thus beneficial. On the 26th June, information was received from the Portsmouth Local Committee, that 34 women and 73 children would be forwarded to London, on their way to their husband's parishes, from Malta, from whence they had been ordered home, their regiments having gone on to Turkey. The inspecting Officer of the Association was immediately ordered to the Waterloo Station, where having with difficulty got them all together, took them to the Pay Office in Westminster, where they were to receive passage warrants for their different destinations. But they were unable to proceed till the next day; and thus would have been left utter strangers in the streets of Westminster, searching in vain for lodgings, which, with the small Government allowance granted for that purpose, they were unable to pay for. Respectable lodgings were found for them all, and their children; and the next day they were despatched to their destinations, with a small donation for travelling expenses. It is needless to add, that all these women were married with leave, and many of them most respectable wives of non-commissioned officers. Upwards of three thousand five hundred women, and seven thousand children, have been kept from actual want during the last six months, the greater part of whom still remain claimants on the Association, especially those who have become widows and orphans. This has been done by the outlay during the past six months of 9172*l.*, chiefly in weekly payments, both by the Central Committee and the 78 Local Committees. Besides these 10,500 women and children, fresh applications are made almost daily to the office; thus showing that the number of women and children left behind is much greater than the public were led to suppose, by the Parliamentary Return called for in both Houses of Parliament. This, however, is accounted for, by showing the inaccuracy of the Parliamentary Return, as follows:—

63d Regiment. Parliamentary Return. No. of Women and Children, 179.	63d Regiment, Association Return. No. of Women and Children. 245.

The Association Return was received during the same month that the Parliamentary Return was given; and as it contained the name of every woman, and the number and ages of every child, and was signed by the Colonel commanding the regiment, it may very fairly be considered to have been the most accurate one. If there be such a discrepancy in the returns of one regiment, what must there be in 40?

MARRIAGE WITHOUT LEAVE.

It is a curious fact that has been brought to light by the practical experience of this Association, that, without exception, those soldiers who have married with leave, or whose wives were admitted into barracks and recognised by the regiment, have left the largest families, and, in consequence, are by far the most deserving of commiseration. To these persons the Association has been of the greatest benefit; while, at the same time, amongst those women married without leave, much misery has been found to exist, which the Association has not refrained from alleviating.

The Committee, however, regret to find, that notwithstanding all the positive and practical good that has been effected by the Association, there still remain in the minds of some military men strong objections to its operations; it is still urged that undue encouragement is given to marriage without leave, and that large numbers of soldiers have thus married since the institution of the Association. If the operation of the Association had afforded such encouragement, surely evidence of it would have appeared from a number of applications for relief on the part of women who had married in anticipation of it. Only one Application has been made at this office by the wife of a soldier whose marriage certificate was dated in 1854; so that the objection would appear to be entirely groundless; and it might be considered almost needless to say more in answer to it. But the Committee have it to show, that while they have only contemplated those cases as entitled to relief which they found already sanctioned by Government, or acknowledged by commanding officers, they have made a rule (No. 3), and have taken all the means in their power to give it publicity, which puts it out of their power to relieve any who may have married, calculating on assistance from them; thus taking into consideration and providing against a contingency which might have arisen, but which has not occurred.

(*For continuation of this advertisement see next page.*)

SOLDIERS' WIVES AND FAMILIES' ADVERTISEMENT—*Continued.*

The following are the rules with reference to this subject:—

1. No soldier's wife is entitled to relief whose name is not entered in the regimental return, which, though it contains the names of all women, whether married with or without leave, is yet signed by the Colonel commanding the regiment, and thus they are partially acknowledged.
2. The Government makes no difference between these women; and the passages of all are equally defrayed to the parishes of their husbands.
3. The rule for the relief of soldiers' wives married without leave is only retrospective; for no soldier who has married without leave, since July, 1854, will be entitled to relief for his wife.

On the 4th July, 1854, at the largest meeting ever held by the General Committee (General the Earl of Beauchamp in the chair), it was unanimously resolved,—

"That from and after the date of this resolution, the 4th July, 1854, no wife or widow be entitled to a donation or pension who shall have married a soldier without leave, whether they belong to regiments on active service, or to regiments now under orders of readiness for active service, provided that such orders of readiness were received subsequently to the formation of this Association, the 7th March, 1854."

As the Government, the Officers commanding Regiments,* and the Association have found it absolutely necessary to countenance, to a certain extent, marriage without leave, and as it appears from the returns of the married men of the 30 regiments of the line, and the 10 regiments of cavalry, that a large proportion of them in each regiment are married without leave, it becomes a serious question how far the treatment hitherto carried out towards wives of soldiers has been successful in the prevention of matrimony. It is evident that, in spite of all the certain misery entailed upon them, soldiers will marry, and can find respectable women to marry them; it is also evident from the universal sympathy shown to their wives and families on the present occasion, that the country would gladly befriend them effectually; the Committee would, therefore, direct particular attention to the concluding remarks at the end of this report, in hopes that some practical measure may be decided upon as speedily as possible, to prevent the recurrence of so much unmerited misery and destitution.

[* One commanding officer who could not find amongst his soldiers' wives married with leave a sufficient number willing to embark with their husbands, and leave their families behind, was permitted by authority to complete the number by selections from the childless women married without leave living out of barracks.]

COLLECTIONS ON THE DAY OF HUMILIATION.

Thousands upon thousands of her Majesty's loyal subjects joyfully followed her most gracious example on this day, and poured in of their abundance for the support of an Association which their beloved Queen and his Royal Highness Prince Albert had honoured with their joint patronage from its first commencement. Had it not been for the noble contributions made on the day of Humiliation, this Association would have been totally unable to grapple effectually with the dire distress and destitution brought to light by its operations. All the great religious communities in the kingdom, *except the Roman Catholic*, unanimously joined on that day to help the soldier's wife and child. To the Church of England especially, this Association is indebted for considerably more than two-thirds of the total amount collected. The Wesleyan Body also contributed largely and generously; the Jews too joined munificently in this national effort by having collections in their synagogues. The Committee remark with much pleasure that these astonishing collections were quite voluntary. No Queen's letter was issued, and never was any public subscription so heartily assisted by the poor man's penny. In numberless congregational collections more than one pound's worth of halfpence was given. Even the prisoners in a large Government prison put their names down for a subscription of more than 20*l.* The total amount collected on that day would have been even greater had not many of the collections been made for the sailor's as well as the soldier's wife. Of these collections the Committee had the pleasure of paying over one-third to the Association for the Widows of Sailors and Marines. The Committee would point out most emphatically that notwithstanding the *remarkable exception in the Fast Day Collections*, no religious distinction whatever is made in the distribution of this noble charity, the recipients are not even asked to what religion they belong.

OTHER COLLECTIONS.

At the head of these stands the county of York. The Yorkshire Association (with his Grace the Archbishop, and all the nobility and gentry of the county as patrons and liberal subscribers) has remitted to the Central Association the large sum of 5000*l.* The Press has very considerately and effectually aided the cause of the soldier's family; but no paper, either of daily or weekly circulation has so practically assisted these poor people as THE LONDON JOURNAL. The Editor of that paper, by the weekly issue of 12 supplements, at one-halfpenny each, has realised the surprising sum of 1424*l.*, which has been paid in weekly instalments of 120*l.* Nothing proves so unanswerably as this does the sympathy of the poor, as the purchase of the supplement was not compulsory on the subscribers to the paper.

Subscriptions have been received from all parts of the world; from Panama, Bahia, Bombay, Quebec, Novia Scotia, St. John's, New Brunswick, Brussels, Pau, Lausanne, Bonn, Paris, Calais, Calcutta, Ceylon, Montreal, Boulogne, the Black Sea Fleet, Bermuda, Fredericton, New Brunswick, &c. The generous sympathy of the Navy for the wives of the army has been very gratifying; indeed the first person who by an able letter in the *Times* roused the public to a sense of their neglect of the soldier's wife, was "A NAVAL OFFICER." But of all the subscriptions perhaps the most touching was that of the Chelsea Pensioners. One old veteran in paying his penny was heard to remark, "Had there been such an Association in my day, when I was away at the wars, my poor old woman would not have died in the workhouse." Several bodies of men of the working classes have agreed to send in weekly penny contributions; the men of Price's Patent Candle Factory, and the men of the Crewe Locomotive Department have already paid in considerable sums collected in this way. From several large towns considerable amounts have been remitted, from Walsall, Cheltenham, &c.; but the town of Bath has exceeded them all by several hundred pounds.

THE RAILWAY COMPANIES—LYING-IN HOSPITALS.

So universal has been the sympathy displayed towards the poor people whom this Association has taken by the hand, that all the great Lines of Railway have been made free to the soldier's child. Particularly the London and North-Western, and the Portsmouth Line, where not only have the children been carried free of expense, but the extra weight of baggage of their poor mothers has not been charged for, an example which the Committee earnestly trust all the Railway Companies will universally follow. Two Lying-In Hospitals in London,—the British Hospital, in Endell Street, and the Queen Charlotte's,—most generously opened their doors to the soldier's wife. Many a poor woman has had deep cause for thankfulness for the care taken of her at the British Lying-In Hospital in Endell Street. Music, poetry, and the fine arts have all been enlisted in this good cause. One simple poem by a child realised nearly 20*l.* for the Association; and the admirable sketch by George Thomas, Esq., of the Soldier's "Separation from his Family," presented by that gentleman to the Committee of the Bath Fancy Fair, has done good service to the cause—representing so truthfully as it does the reality of the distress which this Association is so effectually mitigating.

LOCAL COMMITTEES.

The assistance and practical working of the 78 Local Committees all over the kingdom has been most invaluable. To the Clergy of the Church of England, the staff-officers of pensioners, the garrison chaplains, the local magistrates, and other benevolent persons, the committee desire most cordially to tender their hearty thanks. Had it not been for the indefatigable exertions of the senior garrison chaplain of Dublin, the Rev. Charles Hort, upwards of 400 women and 800 children would now have been the inmates of the workhouse, for in Ireland no out-door relief is granted. The staff-sergeants in the several districts have proved themselves worthy of the profession to which they are an honour; one fine fellow on being offered remuneration for the great trouble he had taken in relieving the poor soldiers' wives in his district, exclaimed, "GOD FORBID THAT I SHOULD TAKE ANY PAYMENT FOR HELPING MY COMRADES' WIVES AND FAMILIES IN THEIR DISTRESS." A perfectly organised system is now established by means of the local committees throughout the kingdom, quarterly statements are regularly transmitted, showing the number of women and children, and the expenditure; and regiments that began regimentally to distribute their own funds have cordially handed over the balance of their funds to the Association, being satisfied with its working, and perfectly content to abide by its rules and regulations. It is necessary to state, however, that the Association has not been permitted to relieve any but the widows and orphans of the Foot Guards, the officers commanding those regiments having funds of their own for the relief of the wives and families of their men, and not wishing to burden the Association.

Extract from the Report of the Limerick Local Committee.

"Limerick, Aug. 28, 1854.

"We have 17 women married with leave on our list. It appears that the women married with leave have the heavier families. It is incontestible that the major part of the women relieved by this committee would, ere this, have been in the workhouse, if they had not been aided. We can safely declare our conscientious belief that the list of women, 83 in number, have shown themselves deserving of the relief administered to them. We have never received a single complaint against one of them. They have universally manifested a desire to obtain work. Several of them have obtained situations as wet nurses, a great fact in proof of the decent, healthy, and well-conditioned state of these individuals. Many are working at the shirt business for a mere trifle, to earn which they must labour all day; and several are learning the trade of shirtmaking without wages, in hopes of being able to assist themselves. Upon a fair review of their conduct and their general appearance, we can safely say that the women relieved by our committee are creditable to the army. Even with the relief they receive, their position is far too trying a one to be anything but a warning, instead of an attraction to other females to enter into the same state, and we advisedly give it as our opinion that the operations of this Committee are not calculated to create the mischief which some imagine is likely to result from the charity and sympathy which have been evinced by the British public for this most unhappy class of women, suddenly deprived of the help of their husbands. "R. P. DOUGLAS,

"Colonel, Assist. Adjt. Gen., Chairman of Committee."

Extract from the Manchester and Salford Local Committee.

"Salford Barracks, August 29.

"I send you a statement of a few cases which strike me as being unusually distressing. There are many nearly as bad, 140 in number. Very few of the women who have *young children* (and the children are nearly all too young to work), can earn anything worth noticing, 2*s.* to 3*s.* a week at the most. Of course those who enjoyed the privileges of living in barracks, &c., as being married with leave, are in the worst circumstances, and they suffer severely. They lose the lodging and advantages of fuel, company's and officers' washing, say 5*s.* or 6*s.* a week, and the assistance of their husband's pay. Lodging here of a very indifferent sort costs them 2*s.* and 3*s.* a week, and they will be far worse lodged than when in barracks. I send you the cases of four women, all married with leave, one with six children, another five, another four, another three; there are many others married with leave, having two or three children, nearly as destitute. There is no employment that they are capable of, hampered as they are with young children, for whose care they *must pay* if they leave them at home and seek employment elsewhere. "A. F. BOND, Major and Staff Officer."

Extract from the Report of the Woolwich Local Committee:—

"Woolwich Rectory, Sept. 4, 1854.

"The women were left in very many cases, I am sure I may say in almost all, without any means for themselves and their children. Many were on the eve of confinement. Their only resource would have been to become paupers on the parish, and their only asylum would have been the workhouse. A generous provision on the part of a grateful country for the wives and families of those on whom they depended, under God, for a successful issue of the war in which we have been compelled to engage, has prevented this. But suppose this had not been the case—How hardly would the maintenance of so many have pressed upon the poor-rate payers! and in many instances how unfairly! Take Woolwich, for instance, and the case would be similar with respect to all garrison towns. We have upwards of 200 women, besides their children, to be maintained somehow. I think it quite possible that the burden would have been felt so heavily, that a memorial might have been sent to the Government. But however this might be, the expense would have been unfairly thrown upon parishes such as our own; but this is a trifling matter when compared with *the pauperisation of respectable wives of soldiers of our army.*

"HENRY BROWN, Rector of Woolwich."

Extract from the Report of the Dublin Local Committee:—

"September 4, 1854.

"I find that since the 1st July to the 2d inst., I have made about 3400 payments (in small sums, varying from 1*s.* to 1*l.* 5*s.*) to about 400 women, soldiers' wives. We have granted several women free passages to their friends and relatives, released clothes from pawn-offices for women going into situations, set up numbers in a small way of business, defrayed the funeral expenses of a few children, and in numberless other ways have been the means of conferring substantial benefits upon these poor people, &c. Had it not been for the small weekly payments, the majority would have been in the poor-house. Many women, although they only received 3*s.* 6*d.* a-week, were thus kept going, and encouraged to work for themselves and children, &c.

"CHARLES HORT, Senior Garrison Chaplain, and Honorary Secretary to Committee."

Extract from the Report of another Local Committee:—"We have hardly relieved any that were not married with leave and on the strength. By the timely aid rendered by your Society much distress was of course prevented, as, as soon as they were left, your excellent Society took them by the hand. But timely as this aid was offered, it was not before, in many cases, the poor creatures had parted with nearly everything, EVEN IN TWO CASES TO THEIR WEDDING-RINGS. What would have been the condition of these poor creatures if no such society as yours had existed! many of them far too high-spirited to have become the inmates of a workhouse, would have been plunged into a state of misery fearful to contemplate. But even as it is, much misery is to be found. A poor delicate creature with two children, married with leave, to whom your Society grants a weekly allowance, has been compelled to part with her furniture. So distressing is this woman's case, and so respectable a character does she appear to be, that some of the other women have helped her out of their own small pittance, &c. Every day I feel more thankful for the good your Society is doing; upwards of 30 are receiving help from you at this place. I only wish those who have contributed large sums to your Society could witness the gratitude of these poor women for the help they receive; they would indeed feel more than repaid for all they have done."

SOLDIERS' WIVES AT VARNA.

Mr. Ray, formerly the active and intelligent Inspecting Officer of this Association, writes from Varna to the following effect:—

"Varna, August 4, 1854.

"Sir,—I beg to draw your attention to the condition of the poor women here. Many of them have died, and others are dying; others who are in a state of convalescence, are not able to proceed further with their regiments, and the men are expected to leave this in about 14 days; and these poor creatures, emaciated and dried with the sun, will be left in a foreign land without any protection or home whatever. What I thought of was to provide a house and food for such as have none; most of them have blankets, but to those who have not, I would propose lending them some, and to encourage those who are able to get about to wait on the sick, cook, and wash. If your Committee is pleased to approve of this plan, I shall be most happy to superintend the whole matter, and I am quite sure it would relieve many a poor man of intense anxiety. The cold weather will be soon setting in, then what will these poor women do? If the ladies in England would send us a little flannel, a few blankets, and left-off garments, they would be rendering us a great service, &c. The great work that is going on for the wives and families of the soldiers by means of the Association in which you take so prominent and energetic a part, causes abundant joy to the husbands and fathers here; and when I remind them of what is doing, they seem overjoyed, and many thanks are expressed both to yourself and the Committee, and benevolent friends, for the sympathy shown them. Numerous are the deaths from cholera and fevers, and doubtless many who are cared for by your Association are really widows, but news of the fact may not have reached them. They have not yet entered the field; but every day the order for embarkation for the Crimea is expected, where doubtless many will fall, and these poor fellows have their eyes upon your Association to protect their wives and children. I am happy to say I have been well received by the men generally; to point them to the 'Lamb of God that taketh away the sins of the world,' is my ostensible work, and to tell them of the great work going on in England for the good of those they have left behind, is in perfect keeping; it is indeed good news. The poor women who have followed their husbands to this place are in a most pitiable condition, and when the expedition sails for the Crimea, they will be left here. Would that we had an association here for these poor objects! Varna is in perfect confusion; how could it be otherwise with such a congregation of nations, fierce, wild, desperate-looking fellows, armed to the teeth, anxiously waiting for the signal to summon them to the fight. May you long be spared in your glorious work, of all works the most enviable, to care for the poor, &c. &c."

Immediately on the receipt of these letters the Committee met, and decided that a donation of blankets, shawls, &c. &c., should immediately be sent to Varna, and the sum of 100*l.* should be granted for the use of these women. On the 1st September goods to the amount of 34*l.* were sent by steam to Constantinople, addressed to the care of the Consul-General, who was requested to use his discretion in forwarding them to Varna. A bill of exchange for 100*l.* was also sent to the same authority, with instructions and authority to Mr. Ray to act as the almoner of the Association. Private letters received by the Committee fully corroborate the fact of the distress of these poor women; for though they receive what are called rations, no other female comforts can be provided for them.

"Camp near Varna, August 24, 1854.

"Dearest,—Yours dated August 3d came to hand on the 16th. I have received all your letters except one. You did tell me, my dear, that 7*s.* a week was what you received from the Association; and although that is a mere trifle in a place like London, yet we ought to be very thankful for it. You say you deeply regret you did not go with me; indeed, my dear wife, much as I desire to be with you, I think it one of the most providential things ever happened for you to be where you are, instead of being here: badly off as you are now, you would be utterly miserable here. We have lost already two married men of cholera. I sleep in the staff tent ever since I got better of the cholera. Everything is enormously high here; a mouthful of white bread and cheese for supper costs 5*d.* One thing lately we can always get, a pint of ale for 2*d.*, or porter 1½*d.*—in fact, it is the only thing we relish; for the bread is very bad, and we get nothing but the nasty beef, which we cannot eat, but boil down and make soup of. I get, as I said before, 1*s.* 10*d.* a day pay. Out of this, 4½*d.* is stopped for rations, and 2*d.* a day for mess money; so that by the time I pay for something fit to eat, there is not much left; still I shall, please God, send you all I can, &c. The women here have no way of making money by washing, the water is too far off, &c. I am sorry to say I have been very ill, and as it is far the best for me to let you know the whole truth, I must inform you that I have had the cholera; I was very bad while it lasted, but thank the God of all goodness for His great mercy, He has restored me. The doctors have been very kind indeed to me; everything I could wish for was got for me; almost all the officers and the colonel came to me, and inquired about me constantly. Poor L. M., J. M., and E., and Mrs. L., have all died since my last; also J. R. and S. F. Indeed, my dearest wife, I rely in perfect confidence in my Redeemer, and feel myself quite unworthy of His mercy; and during the worst of my illness, I felt humbled before Him in whom alone my salvation is sure.—Your ever-loving husband, "E. R."

The wife of the writer of this letter (a most excellent non-commissioned officer) was left nearly destitute with five young children. She bears a most irreproachable character, and is most anxious to exert herself to obtain her own livelihood; but what can she do with five young children? Her two eldest girls are entirely provided for by the Association, and she receives a weekly allowance of 7*s.* The Committee perceive with pleasure that the authorities are gradually sending them home from the East. Three arrivals of soldiers' families have already been brought before the Committee, for no sooner do they land than they apply to the Association, and it is needless to add how readily their application is always responded to.

WIDOWS AND ORPHANS.

The first efforts of this Association were limited to the immediate relief of the Wives of Soldiers ordered on active service, who, in consequence of their having families, were left behind, utterly destitute of all means of existence, save the temporary out-door parish relief. Since that time the sword and the pestilence have too fatally done their sad work, and many of these poor people have become more helplessly destitute by the death of their husbands.

The Committee, however, encouraged by the magnificent contributions received from all parts of the world, have found themselves in a position to make the following scale of donations for Widows, which is the same that was adopted by the administrators of the Waterloo Fund, in 1815:—

Unanimously resolved,—"That relief in the shape of a donation not exceeding the undermentioned sums, being the same as agreed to by the Waterloo Committee on the 28th of June, 1815, be adopted as a scale for the Widows of non-commissioned Officers and Soldiers now serving against Russia.

"A Pension may be granted, in the place of the whole or part of such Donation, should it appear expedient to the Committee."

(*For continuation of this advertisement see next page.*)

SOLDIERS' WIVES AND FAMILIES' ADVERTISEMENT—*Continued.*

Scale of Donation for Widows with Children dependent for Support:—

Rank.	Without Children.	One.	Two.	Three.	Four.	Five.	Six.	Seven.	Eight.
	£	£	£	£	£	£	£	£	£
Serjeant Major.....	90	100	115	125	135	150	160	175	200
Serjeant	60	80	90	100	105	120	130	140	160
Corporal	45	60	70	75	80	90	100	110	120
Drummer..... ...	35	45	50	55	60	70	75	80	90
Private..... ..	30	40	45	50	55	60	65	70	80

Of Widows the Association has already 64 in their books, and of Orphans 108.

The following letter shows that for the Widows of those brave men who perished with their Colonel in the *Europa* transport, ample provision was made, and that the measures adopted for their relief have fully satisfied the Officer commanding the depôt of the Enniskillings:—

"Canterbury Barracks, July 13th, 1854.

"Sir,—I have the honour to acknowledge, with many thanks, the receipt of your memorandum, detailing the amount of the donations granted by the Association of which you are the Honorary Secretary, to the widows and orphans of the five non-commissioned officers and men of the Enniskilling Dragoons, who were lost in the *Europa* transport. The ready and liberal aid thus sent to their relief will, I trust, be effectual to alleviate in some degree their distress; and it marks, too, in a way for which I am most grateful, how deeply the Committee of your admirable Association appreciate the bravery and noble conduct of those who stood by their Colonel to the last. Sure I am, from private accounts which I have received, that had all on board done their duty as manfully as those who perished, there would not have been a life lost in the *Europa*. I have not failed to communicate to the officer commanding the regiment in Turkey the liberality with which the Association have met my application for assistance to the surviving families by a grant of 415*l*. I am glad, too, to express my sense of the admirable arrangements of the Society, by which the distribution of this sum has been entrusted to the persons best able to judge of the most judicious means of administering, in each individual case, to the permanent relief of the sufferers.—I have the honour to be, sir, your obedient servant,

F. ——,

"Commanding Depôt Enniskilling Dragoons.

"Major Hon. H. L. Powys, Hon. Sec."

Case 1540, *W. T.*—A boy of the 33d Regiment, whose father and mother both died of cholera in Turkey; a most distressing case. A weekly allowance granted to the orphan's grandfather, with whom the boy was left.

For the five widows and children of the 6th Enniskillings, annuities have been purchased, large sums having been subscribed for them in addition to the grant from this Association; the amount will render them independent for their lives. For the other widows, donations, varying from 5*l*. to 10*l*., have been granted immediately on the receipt of official notification of their husbands' death. Most of them were already on the books of the Association, and had been receiving relief for some time: it is proposed to grant them an annual pension as long as they remain Widows, and the resources of the Association continue available.

CONCLUDING REMARKS.

Effectually to prevent the recurrence of such distressing scenes as those which gave rise to the formation of this Association, the Committee have had in consideration a plan which it is hoped might tend materially to raise the condition of the soldier's wife, and secure a provision for the soldier's widow.

As there is no probability, under existing circumstances, of so raising the pay of the soldier as to enable him when married to apportion a sufficient share of it to his family while he is on active service, the Committee are of opinion, that a National Fund should be established, of which the invested capital of this Association shall be the foundation, and to which the public and the soldier shall be invited to subscribe annually.

This fund to provide pensions for widows and orphans, as well as temporary assistance to wife and family, who having become subscribers, may be ordered on active service.

The exact subscription which the soldier would be called upon to pay, must depend on the amount of public support the National Fund may receive,—it must always be a very small sum from the soldier; but the Committee are convinced that the country will approve of this proposed attempt to encourage habits of obedience and prudent foresight amongst the married soldiers of the British army. By order of the Committee.

Henry Littleton Powys,
September 7, 1854. Major 60th Royal Rifles, Hon. Sec.

The Central Association in Aid of the Wives and Families, Widows and Orphans of Soldiers ordered to the East.—BALANCE SHEET.

These Accounts Examined and Audited.
George Wm. Bell, Auditor to the Association.

Thus it will be seen that the Sum of Nine Thousand One Hundred and Seventy-two Pounds have already been spent in actual relief for Widows as well as Wives within the space of Six Months, and that at the trifling outlay of a little more than 3 per cent. the sum of £80,269 17*s*. 7*d*. has been raised.

ANNUAL SUBSCRIPTIONS are solicited towards the formation of a NATIONAL FUND for WIDOWS and ORPHANS.

H. L. POWYS, Major 60th Rifles, Honorary Secretary.

LANDSCAPE GARDENING REVIVED AS AN ART.

MR. THOROLD, of Thorpe Bower, near Norwich, continues to offer his services to Ladies and Gentlemen in laying out or re-arranging their Gardens and Pleasure Grounds on correct principles of taste, in any style, or combination of styles, suitable to the requirements of all kinds of residences, upon any scale, and in most cases to produce immediate effect. Mr. T. can give ample references as to his success.

TO LANDSCAPE GARDENERS AND OTHERS

NOTICE IS HEREBY GIVEN, that the COLCHESTER BURIAL BOARD are prepared to receive DESIGNS and ESTIMATES for Laying out, Embellishing and Planting their proposed Burial Ground, containing about 18 acres. The Board will not pledge themselves to employ the party whose design shall be approved, and in the event of his not being employed, he shall be paid the premium of 10 guineas for his design, which shall become the property of the Board. A plan of the ground may be seen, and further information obtained at my Office, as below. All parties intending to send Designs and Estimates are requested to forward the same to me, the undersigned, under sealed cover, indorsed "Colchester Burial Ground," on or before the 30th day of October instant.—By Order,

Philip Smith Sparling, Clerk to the Board.

5, Abbey Gate Street, Colchester, October 7.

BEDFORD BURIAL BOARD.—The Burial Board for the Parishes of St. Paul, St. Peter, St. Mary, and St. Cuthbert, in the Town of Bedford, in the County of Bedford, do hereby give notice that they intend to enter into a Contract or Contracts for Planting the Burial Ground, according to Plans and Specifications to be seen at the Office of Mr. Thomas Jobson Jackson, Architect, Bedford. All persons willing to undertake the execution of such work may make proposals for the purpose, such proposals to be marked "Bedford Burial Board, Tender for Planting," and delivered at the Office of Mr. Theed William Pearse, the Clerk to the Board, St. Paul's Square, Bedford, on or before the 24th day of October instant, and such proposals will be offered to the Board, at a Meeting to be held on the 25th of October instant, at the Shire Hall, in the said Town. It will not be incumbent on the said Board to accept any proposal.

Theed William Pearse, Clerk to the Board.

October 7, 1854.

PERNOLLET'S PATENT APPARATUS for Sorting Wheat, Rye, Barley, and other Grain, Removing Extraneous Matters, and thereby rendering it fitter for sowing. Price 8*l*.—T. Stassen and Pernollet, 51, Old Compton Street, Soho Square, London.

TO FLORISTS AND OTHERS.

J. JONES, Iron Merchant, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. Jones, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

TO NOBLEMEN, STEWARDS, AND OTHERS.

J. WRIGHT, 36, Boar Lane, Leeds, begs to call the attention of parties about to improve their Farm Estates to his O.G. Rain Water Spouting, which, for lightness, durability, and cheapness, cannot be equalled. 4 inch, at 1*s*. 1*d*. per yard; 4½ inch, 1*s*. 2½*d* per yard; 5 inch, 1*s*. 5*d*. per yard.

Wire Working, Sheep Fencing and Hurdles, at reasonable prices. Garden Implements of every description.

N.B. To be Sold, a bargain, a Large Wire Aviary.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the Crystal Palace, Sydenham, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. Conservatories and Aviaries fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. Window blinds of every possible description, of the very best materials and workmanship.

N.B. An allowance to nurserymen and the trade.

NOTICE TO GARDENERS AND OTHERS.

TURF.—Her Majesty's Commissioners for the Exhibition of 1851 are prepared to sell several hundred loads of Turf, on a portion of their Estate, at Kensington Gore.—Particulars may be obtained on personal application to Mr. Wade, at the Office of the Commissioners, Grove House, Kensington Gore, between the hours of 10 and 4.

NURSERIES, CLAPHAM.

To Noblemen, Gentlemen, Nurserymen, and all Persons engaged in Laying-out Gardens, Ornamental Grounds, and Plantations.

THE ADMINISTRATORS of the late JOSEPH FAIRBAIRN beg to call attention to their immense stock of Cratægus, Weeping Hollies, Ash, Willows, and every kind of Tree and Shrub for Garden or Plantation purposes. They have also a fine Collection of Trained and Untrained Fruit Trees, consisting of Standard and Dwarf Peach, Apricot, Nectarine, Apple, Pear, Plum, Cherry, Gooseberry, Currant, and Raspberry, of all the leading sorts. They have still some fine Azaleas, Ericas, Aphelexis, Epacrises, and general Stove and Greenhouse Plants, none of which have been submitted to sale.

Roses, Hollyhocks, and Dahlias, in every variety; all of which are in the best possible condition, and are now offered at a great reduction in price for ready money.

KING'S COUNTY.—MOST DESIRABLE RESIDENCE.

TO BE LET, from the 1st of November next, for such term as may be agreed on, the DWELLING-HOUSE, OFFICES, and DEMESNE LANDS of COROLANTY, containing 162 statute acres, together with 80 acres of valuable bog attached, situate within one mile of the town of Shinrone, in the Barony of Clonlisk, and King's County.

The Dwelling-house, upon which a large sum is now expending in permanent improvements to be completed before the 1st of November, is large and commodious, and in every way suited for a gentleman's residence. There are extensive out-offices attached, and a large walled-in garden, well stocked with choice fruit trees. The land is of a superior quality, well suited for either tillage or grazing. The Tenant can also have 65 acres of an adjoining Townland at present in the hands of yearly tenants. There is a large quantity of Manure, Turf, and a Threshing Machine on the premises, which the Tenant can have at a valuation. The Shinrone Station on the Roscrea and Parsonstown Railway, about to be made, will be within one mile of Corolanty. To a solvent Tenant a long Lease will be given; no other need apply.

Proposals in writing will be received by Joseph J. Walker, Esq., Belfield, Shinrone; or William Peeble, Esq., 9, North Frederick Street, Dublin.

BUCKS.

To Nurserymen and Others.

TO BE SOLD, a capital GREENHOUSE, nearly new, fitted with furnace and cast-iron hot-air flues. Length, 28 feet by 6; width, 14 feet; height, 15 feet by 6. Glazed roof, containing 12 sashes, 6 of which are sliding, with pulleys, complete; the front sashes are made to slide. The whole is in excellent order, fitted with an eleven-tier stand for flowers, with shelves and iron braces.—May be viewed in the grounds of Woburn House, and particulars obtained, on application to Mr. H. Simmonds, Upholsterer and Auctioneer, High Wycombe.

PURE WHITE DORKING FOWLS, Double Rose-combed and Five-clawed. A few very choice birds to be disposed of; prices, 22*s*. 6*d*. for a Cockerel and two Pullets, crate included.—Apply to H. Pickell, Police Station, Egham, Surrey.

TO BE SOLD, FANCY POULTRY, consisting of Imported Brahma Pootra, White-faced Spanish, and Pure Buff Cochin, many having taken 12 or 14 Prizes, the property of Mr. Fox, who, in consequence of removing from his present residence, will dispose of the whole of his valuable Collection of Poultry, which has been selected from most of the best stocks in this country.—For particulars, apply at the City of London Wire Works and Blind Manufactory, 44, Skinner Street, Snow Hill, London.

Illustrated Catalogues of Wire Fencing, Garden Arches, Trainers, &c., forwarded per post on application.

TO PLANT EXHIBITORS.

Important Sale of Magnificent Specimen Heaths.

MR. J. C. STEVENS begs to announce that he will Sell by Auction, on the premises, Crown Hill, Norwood, on TUESDAY, October 10, at 12 for 1 o'clock precisely, about 100 HEATHS, the finest specimen plants ever offered for public sale, and including all the best exhibition varieties grown by Mr. S. Smith, gardener to W. Quilter, Esq., of Norwood.—May be viewed on the day prior and morning of sale; and Catalogues had of Mr. J. C. Stevens, 38, King Street, Covent Garden, London.

FULHAM.

To Noblemen, Gentlemen, Nurserymen, and Others.

MESSRS. PROTHEROE and MORRIS are directed by Mr. Lockhart to Sell by Auction, without reserve, on the premises, Parson's Green Lane, Fulham, on MONDAY, October 9th, at 11 o'clock, a costly and extensive collection of BULBS and FLOWER ROOTS, being about 50,000 in number; also choice Vegetable and Flower Seeds, Fruit Trees in good condition, Standard Roses, a collection of Herbaceous Plants, Two three-light Boxes, and Sundries.—May be viewed three days prior to the Sale. Catalogues may be had (6*d*. each, returnable to purchasers) of Mr. Lockhart, on the Premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM.

To Noblemen, Gentlemen, Nurserymen, Market Gardeners, and Others.

MESSRS. PROTHEROE and MORRIS are instructed by the administrators of the late Mr. Joseph Fairbairn to sell by Auction, on the premises, The Retreat, Larkhall Lane, Clapham, on MONDAY, October 23d, and following days, at 11 o'clock each day, the whole of the valuable stock of FRUIT TREES, consisting of Standard, Dwarf, Trained and Untrained Peach, Nectarine, Apricot, Apple, Pear, Plum, Cherry, Gooseberries, and Currants, &c.; also Ornamental Trees, Evergreens and Deciduous shrubs, &c.—May be viewed one week prior to the Sale; Catalogues to be had (6*d*. each, returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

STOKE NEWINGTON.

To Gentlemen, Nurserymen, Builders, and Others.

MESSRS. PROTHEROE and MORRIS beg to announce that they have received instructions from the Administrators of the late Mr. W. Watts, of Stoke Newington, to Sell by Auction, without reserve, on the premises, on MONDAY, October 30, and three following days at 11 o'clock each day, the whole of his unrivalled Nursery Stock, consisting of an immense quantity of American Plants, Ornamental and Fruit Trees, Evergreens, and Deciduous Shrubs, fine Fruiting Mulberries; also the Greenhouse Plants, comprising 200 fine Double Camellias, 50 very fine specimen Indian Azaleas, Heaths, Epacris, &c., together with Greenhouses, 2 and 3-light Boxes, Gold and Silver Fish in Ponds, an excellent Horse, two capital Carts, Wheelbarrows, Garden Tools, and sundry effects. May be viewed one week prior to the Sale. Catalogues may be had (6*d*. each, returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

MR. DOWSETT will Sell by Auction, without reserve, under a Power of Sale on a Mortgage, on TUESDAY, the 24th October next, at the Auction Mart, London, at 12 o'clock, BINFIELD NURSERY, Binfield Road, Stockwell, Surrey. The Nursery Ground consists of 1¾ acre, walled around; a substantial brick-built Cottage containing five convenient rooms on the ground floor; and three newly-erected Greenhouses and two Sheds. Held on Lease for the unexpired Term of 80 years, wanting 28 days, from Midsummer last, at a low ground rent of 40 guineas.—Particulars of Mr. Thompson, 3, Finsbury Chambers, London; and of the Auctioneer, New Town, Homerton, and Chelmsford.

Printed by William Bradbury, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and Frederick Mullett Evans, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, Oct. 7, 1854.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Notice is hereby given that an ELECTION of TWO PENSIONERS on the Funds of this Charity will take place in January next. All persons desirous of becoming Candidates at such Election are requested to send in their petitions and testimonials to the Committee on or before the 1st November next, after which time they will not be received.

Printed forms of petition can be had upon application to the Secretary. By order of the Committee,

7th October. E. R. CUTLER, Secretary.

14, Tavistock Row, Covent Garden.

WILLIAMS' EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON have been appointed Agents by Mr. Davis, of Malvern, for the sale of the above-named magnificent CLIMBING ROSE. Good established plants, 3*s*. 6*d*. each. Usual discount to the trade. For particulars purchasers are referred to their own and Mr. Davis' advertisements in *Gardeners' Chronicle* of October 7, page 643.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

THOMAS JACKSON AND SON, having a large healthy Stock of STOVE, ORCHIDACEOUS, and GREENHOUSE PLANTS, respectfully invite intending purchasers to an inspection; in addition to the established favourite kinds will be found many novelties now offered at very low prices.

Kingston, near London.

ROSE NURSERIES, HERTFORD.

E. P. FRANCIS' List of ROSES, containing all the new varieties worth cultivating, with a stock of 5000 dwarfs in 150 sorts, most successfully grown on the Manetti Stock, is now ready for delivery, and will be forwarded to any amateur, gratis, on application.

HOLLYHOCK SEED.

WILLIAM CHATER begs to offer packets of the above Seed, containing twenty sorts, selected from his best show varieties, at 5*s*.; 12 varieties, do., 2*s*. 6*d*.; and from good double border sorts, at 1*s*.—Also Pansy Seed, from the best flowers, 2*s*. 6*d*. per packet.—Strong Plants of the new Double Crimson Rocket, excellent bedding plants for spring flowering, 6*s*. per dozen, or 2*l*. per 100; Double French White, 4*s*. per doz., or 30*s*. per 100.—Saffron Walden, October 14.

PRIMULA SINENSIS.

J. AND J. HAYES begs to offer their fine fringed varieties of Red and White PRIMULAS; fine strong plants, in 60-sized pots, ready for shifting, at 6*s*. per dozen, packing and carriage included, to any railway in London. All orders from unknown correspondents to be accompanied with a Post Office order, payable to J. & J. HAYES, Edmonton, Middlesex.

R. SMITH is now sending out his New Seedling Strawberry, SIR CHARLES NAPIER, the best forcing one of the day, admired by all who have seen its growth, and for colour not one to equal it.—Price, 3*l*. per 100; 50 for 30*s*.; 25 for 1*l*.

R. SMITH, Market Gardener, Richmond Road, Twickenham; or G. GLADMAN, Salesman, Covent Garden Market, London.

DUTCH HYACINTHS, for Forcing, single and double, at 4*s*. per dozen. Also Narcissi, Crocuses, Tulips, Irises, Jonquils, Anemones, and Ranunculuses, priced Catalogues of which will be forwarded by post, from ARTHUR COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall.

Also Double Roman and Paper White Narcissus, the most beautiful and fragrant of all the Narcissi, 4*s*. per dozen.

HART AND NICKLIN, FLORISTS, &c., Guildford, offer the following Plants:—

GERANIUMS, 12*s*. per dozen, including Optimum (Foster).
Fancy ditto, 10*s*. per dozen.
PANSIES (choice show flowers), 10*s*. per dozen.

MAY'S EARLY ASH-LEAVED KIDNEY POTATOES, free from disease, 10*s*. per bushel, 14*s*. per cwt., 12*l*. per ton, sacks included.

EARLY FORTYFOLD POTATOES.—The editor of the *Gardeners' Chronicle* says, "These are a well-known kind, of good quality; a good cropper, and is found by us to be quite as early as the Ash-leaved Kidney, if planted early, escaping all disease, yielding immense crops." They are of the red kind, and round. 8*s*. per bushel, 11*s*. per cwt., 9*l*. per ton, sacks included.

Address, HENRY MAY, The Hope Nurseries, Bedale, Yorkshire.

BROWICK RED WHEAT.—Seed Wheat of the above description, and true may be obtained immediately by addressing Mr. EDWARD BALL, Bailiff, Hodgmoor, Beaconsfield. Price, by Quarter, Sack, or Bushel, 10*s*. per Bushel. All orders to be accompanied by Post-office order or remittance.

PERUVIAN BARLEY, FOR AUTUMN OR SPRING SOWING.—A packet of this prolific, skinless, hardy, heavy, and very early variety of Barley, sufficient to sow one rod of ground at six inches apart square, will be sent to any address, post free, on receipt of eight postage stamps, warranted genuine and selected grains, from ABRAHAM HARDY & SON, Seed Growers and Seedsmen, Maldon, Essex.

RENDLE'S NEW DESCRIPTIVE CATALOGUE OF DUTCH ROOTS *is just published, containing lists and prices of the best Hyacinths, Tulips, Ranunculuses, Anemones, Crocus, Iris, Narcissus, Jonquils, Gladiolus, &c., to be had in exchange for two penny stamps, from*

WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth.

CARNATIONS, PICOTEES, AND PINKS.

JOHN KEYNE'S ANNUAL CATALOGUE, containing all the finest SHOW FLOWERS, is now ready, and will be sent, on application to the Castle Street Nursery, Salisbury.

SURREY GARDENS, GODALMING, SURREY.

THOMAS WELLAND offers strong and genuine Early Battersea, E. York, E. Imperial, and Drumhead Plants, packed and delivered at Godalming Station, at 3*s*. 4*d*. per 1,000.

ROSES.

THE DESCRIPTIVE CATALOGUE OF ROSES for the Season, by THOS. RIVERS, is now ready for delivery, and will be sent on application for two postage stamps. A choice selection of varieties only is inserted, so that it forms a useful guide to the Amateur.—Nurseries, Sawbridgeworth, Herts.

ROSE CATALOGUE FOR 1854-55.

WILLIAM WOOD AND SON are now prepared to issue COPIES of their New ROSE CATALOGUE for the present season on receipt of two postage stamps. General Catalogue of Nursery Stock may also be had on same terms.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER'S descriptive List of the above splendid flowers, containing hints on their culture, and observations on exhibiting, &c., is now ready, and may be had on application, by forwarding one postage stamp.—Saffron Walden Nursery, Oct. 14.

BASS AND BROWN'S NEW AUTUMN CATALOGUE, containing the following, is now complete, and supplied free by post for three Penny Stamps.

Dutch and Cape Roots.	Hardy Herbaceous Plants.
Geraniums.	Potentillas.
Cinerarias.	Hollyhocks.
Azalea indica.	Antirrhinums.
Fuchsias, Verbenas, Petunias (best new of 1854.)	Conifers, and other Select Trees and Shrubs.
Stove and Greenhouse Plants.	Hardy Climbers.
	Roses, Fruits, &c. &c.

Seed and Horticultural Establishment, Sudbury, Suffolk.

TULIPS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to inform the AMATEURS OF TULIPS that his CATALOGUE is ready, and will be forwarded by post on application. He is happy to say that from the superior growth of last spring, he has been enabled to make a considerable reduction in the prices.

HYACINTHS AND DUTCH BULBS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that he has received his HYACINTHS AND DUTCH BULBS, in excellent condition, and that they are much finer than usual.—His CATALOGUE of BULBS, &c., will be forwarded on application.

DUTCH BULBS.

THOMAS CRIPPS, NURSERYMAN, SEEDSMAN, and FLORIST, respectfully announces that his annual importation of the above has just arrived in excellent condition, Catalogues of which, comprising, amongst others, many new and choice varieties of Hyacinth, Crocus, Tulips, Anemones, &c., may be had on application.—Tunbridge Wells, Oct. 14.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

AMERICAN NURSERY.

GEORGE BAKER'S Descriptive CATALOGUE of AMERICAN PLANTS, Coniferas, Ornamental Shrubs, Fruit and Forest Trees, &c., may be had by enclosing two postage stamps.

G. B. wishes to call particular attention to his fine Stock of Weeping Hollies, from 3 to 10 feet high.

American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, Windsor Branch South Western Railway, where conveyances may be obtained.

NEW BEDDING GERANIUM,
CAINES' SCARLET UNIQUE.

MR. CAINES begs to inform the nobility, gentry, and trade in general, that he intends sending out the above the first week in November. It was exhibited at the Chiswick and Royal Botanic Horticultural Shows, where it was considered a great novelty, and well adapted for Bedding purposes. Price 5*s*. per plant. Printed lists of his large collection of Pelargoniums, both Fancy and Show varieties; also lists of Greenhouse, Stove, and other Hard-wooded Plants, may be had by applying at the Nursery, Surrey Lane, Battersea.

TWELVE SUPERIOR HYACINTHS *for 6s.; mixed sorts, 4s. per dozen, as well as every kind of Bulbous Root, can be obtained carriage free from*

WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth.

HYACINTHS ... ... 4*s*., 6*s*., and 9*s*. per doz.
ANEMONES, best double varieties ... ... 5*s*. per 100.
RANUNCULUS „ ... 3*s*. to 5*s*. „
CROCUS ROOTS, very large ... 1*s*. 6*d*. to 2*s*. „

And all other kinds of Dutch Roots, imported direct from the first houses in Holland, at the lowest remunerative prices.

Apply to WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth.

GEORGE JACKMAN begs to announce that he has just published a new and complete CATALOGUE of his Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.

Woking Nursery, 1½ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—Oct. 14.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Pine-apple Place, Edgeware Road, London.

L. VAN HOUTTE'S NEW GENERAL CATALOGUE, No. 53, is just published, containing descriptive lists and prices of Azaleas, Camellias, and Rhododendrons; Stove, Greenhouse, and Hardy Plants of every description, including many fine and valuable novelties; tender and hardy flowering bulbs in great variety, and of superior quality, &c., &c. May be had on application to his agent, Mr. SILBERRAD, 5, Harp Lane, Great Tower Street, London. The CATALOGUE of Flower and Vegetable Seeds will be published early in the month of November next.—LOUIS VAN HOUTTE, Nurseryman and Seed Merchant, Ghent, Belgium.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, respectfully informs his friends and the floricultural public that his priced and descriptive CATALOGUE of FLORISTS' FLOWERS, &c., is now ready, and will be forwarded on application, enclosing a postage stamp.

Selected Pansy Seed, 1*s*. and 2*s*. per packet.

J. H., having a large surplus stock of the older varieties of SHOW TULIPS, he will dispose of them at 20*s*. per 100, strong blooming bulbs.

The FLUKE POTATO for seed, 5*s*. per bushel.

SEED POTATOES.—BRITISH QUEEN, as an abundant bearer, for early maturity, and excellence in eating, unsurpassed; price per bushel (bag included) 7*s*. EARLY ASH-LEAF (true) 8*s*. per bushel. FORTY FOLD, 6*s*. per bushel. HART and NICKLIN, High Street, Guildford.

VINES IN POTS,

GROWN UNDER GLASS FROM SINGLE EYES, 4 to 6 feet high.

ALEXANDER PONTEY, NURSERYMAN, Plymouth, begs to offer the following sorts of VINES, warranted true to name. If 12 or more are ordered, they will be delivered free in Bristol or London; price 2*s*. 6*d*. to 3*s*. 6*d*. each.

VINES.—Alicant, or Black Spanish; Barbarossa; Black Hamburgh; do. Hampton Court; do. Varners; Constantia, black; Eschalota superba; Frontignac, White; do. Grizzly; do. Red; Gromier de Cantab; Joslyn St. Aubyns; Muscat of Alexandria; do. Tottenham Court; do. Lunet; Lees (early); do. Canon Hall; St. Peter's (Oldacres), black; Wilmot's Royal Victoria; Tripoli (Wellbeck's); Sweet Water (White Dutch); do. Grove's End.

Plymouth Nursery.—Oct. 14, 1854.

NEW SEEDLING AURICULAS, ETC.

LIGHTBODY'S SIR JOHN MOORE.—Green edge. Figured in the "Florist" for June, 1852. Strong plants, 1*l*. 10*s*.

LIGHTBODY'S SIR CHARLES NAPIER.—Grey edge; per plant, 15*s*.

LIGHTBODY'S COUNTESS OF DUNMORE.—White edge per plant, 15*s*.

LIGHTBODY'S METEOR FLAG.—Blue self; per plant, 15*s*.

NEW PINK.—LIGHTBODY'S ELIZABETH GAIR.—Warranted one of the most perfect Pinks in cultivation. Per pair, 5*s*.

LIGHTBODY'S PRINCESS MAUDE ROSE BREEDER TULIP.—Extra fine, per Bulb, 20*s*.

LIGHTBODY'S LOCHINVAR SEEDLING RANUNCULUS.—Figured in the "Florist" for January, 1853. Per root, 5*s*.

GEORGE LIGHTBODY, Falkirk.

NORTHGATE NURSERY, CHICHESTER.

JAMES GRAHAM, late Gardener and Steward to Mrs. Smith, Bersted Lodge, Bognor, begs most respectfully to announce to the Nobility, Clergy, and Gentry, and to the public generally, that he has succeeded to the long established NURSERY and GARDEN SEED BUSINESS of Messrs. SILVERLOCK and SON. J. G. trusts that by constant personal attention, and from his experience in the practice of Horticulture, as well as from his being well known in the neighbourhood, he may venture to solicit a continuance of the patronage and support so long bestowed on his predecessors.—Oct. 14.

RARE AND HARDY CONIFERÆ.

THE following CONIFERS having proved perfectly hardy during the past winter and spring in this well-known bleak district, exposed to the cutting winds from the North Sea, induces YOUELL AND CO. to offer the same with every confidence, and beg to annex a scale of prices for good Plants.

TULIPS, extra fine, mixed, all from named flowers, 12s. per doz.

All orders of £2 and upwards are delivered carriage free to London, Hull, and Newcastle-on-Tyne, as well as to any Railway Station within 150 miles of the Nursery. Communications by Steamers and Railway to all parts of England, Ireland, and Scotland, as well as the Continent. Post-office Orders to be made payable to YOUELL & Co.

ROYAL NURSERY, GREAT YARMOUTH.

CHATERS' SEEDLING PANSY, PICOTEE.

J. CHATER AND SON beg to announce that they intend sending out after the 20th October, their SEEDLING PANSY named PICOTEE, in strong plants, 5s. each. Pure white ground, beautifully edged with azure blue; eye large, fine form and substance. The margin of this flower resembles a fine Picotee.

Also Hollyhock Seed, from the best sorts, in packets containing 200 Seeds, 1s. 6d.; 400 Seeds, 2s. 6d.

Fine Plants of splendid Sweetwilliam, 1s. 6d. per dozen; 10s. per 100.

Choice Pansy Seed, 1s. to 2s. 6d. per packet.

A catalogue of the best Hollyhocks, Pansies, Roses, and Pinks, can be had on application to J. CHATER & SON, Nurseries, Haverhill, Suffolk.

CATTELL'S EARLY BARNES CABBAGE,
" " RELIANCE "
" GREEN COLEWORT "

Plants of the above are now ready, 5s. 6d. per 1000, stout bedded; 4s. 6d. per 1000 good seedlings. No charge for crates, baskets, or packing. Packages of 5000 or more, delivered to the Edinbridge Station, South-Eastern Railway, carriage free.

Orders from unknown correspondents to be accompanied with post-office orders made payable here.—Address,
JOHN CATTELL, Westerham, Kent.

EARLY SEED POTATOES.

THE BRITISH QUEEN, ... 30s. per sack of 16 stone.
THE SHORT TOP ASH-LEAF, 30s. do. do.

The following letter has been received by the advertiser this week:— (Copy)

Sir,—I was induced, last year, to try your Short Top Ash-Leaf, and I must, in justice to you, say that though I have been an Ash-Leaf grower for years, I never yet met with anything so good as your "Short Top;" my crop has been most abundant, and entirely free from disease. You are at liberty to make use of my name if you think it will be any service to you.—(Signed)
J. CALVESBERT, Cock Watch Farm, near Colchester.

For character of the British Queen refer to this paper of Saturday, Sept. 23.—Orders to any extent can be executed either for the "Queens" or "Short Tops."—Letters or inquiries must inclose a stamped envelope, and all orders made payable to JOSEPH WILSON, Seed Potato Merchant, Ipswich.

FRUIT TREES.

THOS. RIVERS begs to submit to the Public the following synopsis of his Fruit Tree Culture, which is this season more than usually complete and extensive.

APPLES, on Crab Stocks: standards for orchards, dwarfs, and dwarfs trained for espaliers.

APPLES, on Paradise Stocks, for gardens: pyramids, dwarf bushes, dwarfs trained for espaliers, and dwarf bushes in pots.

APRICOTS: standards, standards trained, half standards in pots, dwarfs, dwarf bushes for potting, dwarfs trained for walls, and dwarfs in a fruiting state in pots for orchard houses.

CHERRIES, on black Cherry Stocks: standards, standards trained, dwarfs, and dwarfs trained.

CHERRIES, on the Mahaleb Stock: dwarf bushes for potting and culture as bushes, dwarfs trained for walls, and dwarf bushes in pots.

CURRANTS: dwarf bushes, including some new and fine varieties.

FIGS, in pots: the same larger and in a bearing state.

GOOSEBERRIES: small, high-flavoured, old sorts, and all the large new Lancashire varieties.

GRAPES for Vineries, from eyes, in pots: strong plants, two and three years old; ditto, in pots, dwarf bushes for orchard houses; ditto, hardy sorts from the open ground for walls.

MEDLARS: standards and dwarfs.

MULBERRIES: standards and dwarfs trained for walls.

NECTARINES and PEACHES: standards, standards trained, half standards in pots, dwarfs, dwarfs trained, and dwarfs in a fruiting state in pots for orchard houses.

NUTS and FILBERTS: dwarf bushes, and standards 4 feet high, grafted on the Hazel Nut.

PEARS, on Pear Stocks: standards, standards trained, dwarfs, dwarfs trained for espaliers and walls; pyramids six years old, twice or thrice removed, in a bearing state; these are adapted for gravelly and chalky soils unfavourable to pyramids on the Quince Stock.

PEARS, on Quince Stocks: standards trained for walls, pyramids, pyramids root-pruned, in a bearing state; dwarf bushes in a bearing state, for potting, or for culture as bushes; dwarf bushes in pots, in a bearing state, for orchard houses.

PLUMS: standards, standards trained, dwarfs, dwarf bushes for potting or for garden culture, dwarfs trained for espaliers and walls, dwarf bushes in pots for orchard houses, and pyramidal trees in a bearing state.

QUINCES: standards of the common Quince, and pyramids of the large Portugal Quince.

RASPBERRIES: cases of the finest varieties.

STRAWBERRIES: runners of the finest varieties.

WALNUTS: standards and dwarfs for gardens of the Dwarf Prolific Walnut.

For descriptions and prices, see Descriptive Catalogue of Fruits published October, 1853, and sent post free for four stamps.
Nurseries, Sawbridgeworth, Herts.

NEW HARDY CONIFERS.

HUGH LOW AND CO. announce to their friends and the public that they have been appointed by Messrs. Parsons & Co., of Flushing, New York, Sole Agents in this country for the sale of the undernamed CALIFORNIAN CONIFERS. The Plants are raised from seed, and will be delivered as soon as the growth of the present season is sufficiently matured. THUJA GIGANTEA (Nuttall); *synonyms* LIBOCEDRUS DECURRENS (Torrey); THUJA MENZIESI (Douglas); THUJA CRAIGIANA (Jeffreys).—A magnificent species, and the most desirable Tree known to exist in California. It was discovered by the botanists of the United States Exploring Expedition, and is described by Professor Torrey, in "Plantæ Fremontianæ," as growing near the upper waters of the Sacramento, from lat. 38° 40' to 41° N. He also states it is a noble tree, attaining a height of 120 to 140 feet, with a trunk 7 feet in diameter, rising from 80 to 100 feet without a limb. This tree will be perfectly hardy, and will take the foremost rank amongst our ornamental trees, as the foliage is most beautiful, reminding an observer of some of the more graceful species of Lycopodium.

The Plants when delivered will average 1 foot to 1½ foot in height, and being of such unusual size for a new Conifer, will produce an immediate effect. Price 31s. 6d. each.

ABIES NOBILIS.—This well-known Fir requires no description. Plants from seed have long been desiderata, and those now offered are strong and well shaped, from 6 inches to 1 foot in height. Price 31s. 6d. each.

In addition to the above, H. L. & Co. have to offer from the same source strong Plants of several species of hardy CALIFORNIAN PINES, collected in districts little explored. Amongst them will be found Pinus Jeffreyana, Pinus Parryana, offered for the first time; and judging from the CONES of the different species, it may with certainty be inferred that several others will prove entirely new to this country. Price 84s. per doz.

Messrs. Parsons & Co. having been successful in raising these fine Conifers in considerable numbers, have determined on offering them at the low prices quoted above, with a view to insure their speedy introduction into every collection in Europe.

Discount allowed only when twelve plants of a sort are taken.
Clapton Nursery, London, Oct. 7.

BASS AND BROWN *beg to offer the following from their New* CATALOGUE, *just published, which may be had on application for three postage stamps. They have this season a very fine and vigorous stock of Roses, which are offered at very reduced prices.*

Beautiful collection of Ixias, Sparaxis, Oxalis, Tritoma, Cyclamen, Lilium, and an extensive variety of other Roots.

Goods carriage free (not under 20s.) to all the London Termini, and all Stations on the London and Norwich Colchester Line, and Plants added gratis with orders of 40s. and upwards. Post Office orders payable to BASS & BROWN, *or to* STEPHEN BROWN, *Seed and Horticultural Establishment, Sudbury, Suffolk.*

THE PERPETUAL TREE VIOLET, or DOUBLE VIOLA ARBOREA.—The original grower of this, the true variety of the above beautiful Violet, now offers it to the public; it has surpassed all others, and now stands without an equal for its size of flowers, fragrance, and perpetual blooming; and as a plant for the Conservatory or Greenhouse, nothing can equal it. Large plants, 6s. per dozen; smaller ditto, 3s.

DOUBLE WHITE TREE VIOLET.—This is also a fine variety, and resembles the other in many respects, with the exception of its colour. The stock of this is small, in consequence of the great demand for it last season; parties requiring plants should not delay their orders. 6s. per dozen.

THE RUSSIAN SUPERB VIOLET.—One of the finest of single Violets, large blooms, with long stems, and most delightful fragrance; will bloom well through the season if sheltered from the heavy rains and severe frosts during the dead of winter. Plants 3s. per dozen.

A TREATISE on the best and most effectual mode of cultivating the VIOLET, post free for 12 stamps, or sent gratis with all orders above 5s.

GIANT SCARLET BROMPTON STOCK plants are now ready for planting out; the spikes of flower are very large, (measuring from 18 to 24 inches in length) and so fragrant that they are admired by all who have seen them. Fine strong plants, 6d. per dozen, or 4s. per 100.

STRAWBERRY PLANTS.—Good strong plants of the following superb varieties can be supplied:—Nimrod, 10s. per 100; Prince of Wales, 10s. do.; Ajax, 5s. do.; Ruby, 5s.; Myatt's Eleanor, 3s. do.; British Queen (true), 3s. do.; Black Prince, 3s. do.; Cremont's Perpetual, 3s. do.; Victoria, 5s. do.; Surprize, 3s. do.; and a great number of other good old varieties, at 3s. per 100.

POLYANTHUS SEED, saved from the best laced varieties, 1s. per packet.

ANTIRRHINUM SEED, all saved from the best named varieties, 1s. per packet.

EXTRA FINE SWEET WILLIAM SEED, saved from all the best and most beautiful varieties, 1s. per packet.

VERY SUPERIOR WELL RIPENED HOLLYHOCK SEED, 1s. per packet.

LORD KEYNON'S FAVOURITE CUCUMBER is the best and most productive for winter cultivation ever grown, requiring less heat than any other of the kind. It is a very handsome fruit and free setter. Good old seed of the above true variety may be had, price 2s. 6d. per packet.

The Violets and Seeds will be sent postage free, but the Strawberry Plants and Stocks will be sent by hamper, package free.

Any of the above will be forwarded on receipt of Post Office Order, or Penny Postage Stamps, for the amount by

EDWARD TILEY, Nurseryman, Seedsman, & Florist,
14, Abbey Churchyard, Bath, Somersetshire.

NEW VARIEGATED GERANIUMS.

JOHN AND CHARLES LEE beg to inform the admirers of Variegated GERANIUMS that they have purchased the Stock of two very promising Seedlings, which are decided improvements on those already introduced by them. The first they have named

MRS. LENNOX,

in compliment to the lady of the raiser, Thomas Lennox, Esq., of Stamford Brook Lodge, Hammersmith. The whole aspect of this plant is very striking, the habit being extremely vigorous, with leaves measuring from 4 inches to 6 inches across, and having a broad margin as white as the driven snow. The trusses are very large, of the most intense scarlet, and stand well above the foliage. The other we have named the

SCARLET FLOWER OF THE DAY,

giving an accurate idea of its character and properties. The foliage and habit are precisely the same as in "The Flower of the Day." The truss is larger and bolder, and the pips are well shaped and of great substance. The colour is all that can be wished for, being a fine scarlet, vieing with even the most favourite green-leaf varieties, and is not subject to burn under the hottest sun, either under glass or out of doors. Notice will be given next season, when they are ready to be sent out. This is inserted to prevent other parties from using the names surreptitiously.
Nursery, Hammersmith.

CHRYSANTHEMUMS.

R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's selection at 9s. per dozen.

CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4s. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9s. per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12s. per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.
Paradise Nursery, Hornsey Road, Islington.

NEW CLIMBING HYBRID PERPETUAL ROSE,
THE "DUCHESS OF NORFOLK."—Colour, Vivid Crimson
To be sent out for the first time about the end of October.

WILLIAM WOOD AND SON beg to refer to their advertisement in the *Gardeners' Chronicle* of September 30, page 627. Standards, half-standards, or dwarfs, will be supplied at 10s. 6d. each, with the usual allowance to the trade.

N.B. When six plants or more are ordered by the trade, a very considerable reduction will be made beyond the usual discount, particulars of which may be had on application.

A Drawing of the above may be had for 6 Postage Stamps.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 14, 1854.

AMONG the questions connected with the miserable history of the Royal Forests is one of very considerable importance in rural economy—namely, the manner of STRIPPING BARK AND DRYING IT. We need not say that the sale of bark is perhaps the most unfailing source of revenue from woodland property, and that its market price depends, like everything else of the same nature, upon the fineness of the sample. It was, therefore, part of the late Commissioner's duties to take care that this subject should be thoroughly investigated. A very little inquiry led him to doubt whether the bark of the Crown forests could be as valuable in the market as that of private proprietors, especially when it was reported to him, upon the best authority, that in the Forest of Dean, in the west of England, the Crown surveyors were in the habit of curing it by placing one end on the wet ground and the other against a horizontal rod; an old and barbarous practice long ago condemned by skilful foresters, and, we believe, very little employed.

We scarcely need remind our readers that the modes of curing bark are three. One has been just described; a second is to rest it on a bank, technically called a horse, composed of faggot wood; and the other is to place it upon roughly constructed horizontal stages, or *ranges*, standing 2 or 3 feet above the ground. The last, which are commonly used in Scotland, and are fully described in BROWN'S "Forester," are undoubtedly the best. It is very true that in a good climate, or a very fine season, bark may be well enough cured by the two first methods; but as the object of the forester should be to place his bark beyond the risk of accident, we cannot but think that staging, which affords the best security attainable, would be universally employed if the method were understood.

What is the object sought in curing bark? except to deprive it quickly of all superfluous moisture, so that it may keep in stacks without risk of change; and to do this without permitting its quality to be injured by exposure to rain; or in other words to secure a clean bright sample, which shall have lost none of the *tannin* for which it is valued. If these ends are attained it is of no consequence how the operation is conducted, and the cheapest way will be the best. Now there is no natural agent so efficient in removing moisture as currents of dry air, and it should therefore be the business of the forester to secure by every contrivance within his reach the rapid circulation of draughts of air among his bark. The quicker it is dried naturally the better; change of colour in vegetable substances of this nature is caused by fermentation more or less prolonged; in the absence of moisture, fermentation

is impossible; in ill-ventilated places it takes place most rapidly. This is known to everybody who has dried a flower between the leaves of a book; if the flower is dried rapidly, in consequence of continual abstraction of its moisture, it retains its colour and becomes what a tanner might call a clean bright sample; if it can only part with its moisture slowly it becomes brown; and if the drying process is much delayed it will even change to black. These are, we apprehend, either self-evident propositions, or notorious facts.

It appears, however, from the evidence before us that in the Forest of Dean no ideas of the kind had taken root; in that forest it is not customary to reason; that a thing is usual is an answer to all enquiry. "There is a person there," says Mr. Kennedy in his examination before Mr. Drummond's Committee, "a Mr. Langham, who is governing man in one sense, under Mr. Machen; when I spoke to him about this thing, he said, 'Oh, sir, it was never done otherwise in the forest; it was the old practice, and therefore it was adhered to.' I never could get a reason, either verbally or in writing, from Mr. Langham." When, adds Mr. Kennedy, I went into Dean Forest in June, 1852, it was raining day after day, and it certainly appeared to me an odd system; the way of drying the bark was to put it up on end on the wet Grass. We have in this instance a standard by which to measure the forest officers' intelligence; in the Forest of Dean they are of opinion that the best way of drying bark is to keep it in the wet. The late Commissioner, who had been accustomed to deal with rational beings, thought he would put an end to Mr. Langham's system and have the bark staged, a method entailing very little additional expense, and offering the greatest certainty that is obtainable of the drying being well conducted. Need we add that the attempt failed? Four Scotch workmen were sent to the forest, and they carried out the plan as far as they could. But it was not to be endured that Scotch foresters should presume to instruct the Gurths and Wambas of the Royal Forest of Dean, and the attempt was necessarily abortive. The woodmen had no mind to it, the Scotchmen could exercise no control; the surveyor's deputy "would give no assistance whatever; he was perfectly passive and inefficient," and the result was that the bark was spoiled. Then, no security was taken from the purchasers that they should remove the bark at the proper time; they delayed removing it "in the most wilful and perverse way, left it till it got a month's rain," and the sample became worse; whereupon claims were impudently set up for an abatement in the price. Mr. Kennedy told the Committee that this led him to have some of the woodmen up and examine them, "and one of the facts which came out was, that the bark of one of the claimants for a diminished price had been sunk in a barge in the Wye, and then it was carried to Monmouth, and he made a claim for it on the ground of its being badly cured." Such are the doings in Her Majesty's Forest of Dean; and such the facts upon which some Honourable gentlemen have come to the conclusion that the best mode of drying bark is by keeping it in the wet. Upon this point the evidence itself is too good to be withheld; the member of the Committee examining the witness was Colonel Clifford, M.P. for Hereford.

"823. You mentioned that you disapproved of that method of stacking the bark on the ground?—I did.

"824. Are you aware that that is the system pursued through the whole of the adjacent counties by timber dealers?—I believe it is; but I do not approve of it.

"825. Are you not aware that they purchase wholly for profit?—A man farms for profit; he puts four horses right on end, and he ploughs in that way; but nothing would persuade me that that was the proper way of ploughing. I should endeavour to reform it."

Connected with this question of drying bark was another of peeling it. Some foresters think it right to cut the young Oaks called flitterns, first, and to peel them afterwards; others prefer to peel them standing. In the Forest of Dean the latter method was followed, the bark was taken off, and then people were sent clambering over them; the consequence was, a certain loss of bark, and a very considerable unnecessary expense. The trees were left standing for six months, for the avowed object of providing work for the workmen in the winter; whereas Mr. Kennedy tells us he would have had them down at once, had the bark taken off with the utmost celerity, and then the remaining trees would have had the benefit of that year's growth. This was resisted, and it was impossible to get it accomplished. In the words of the evidence "there was the utmost possible resistance to it; and 64 woodcutters struck work, and would not touch it. They sent a memorial to me. I may mention that out of the whole 64 woodcutters not one of them could write his name. When this was resisted to such an extent, I thought that I would make inquiry whether I was desiring to introduce a system which in itself was so unreasonably absurd, that it was not countenanced anywhere else. I knew I was quite right as to many of what I think the most enlightened estates of the kingdom, because I wrote to the Duke of Bedford's steward, I wrote to Lord Hatherton's steward, the Duke of Sutherland's steward, and Lord Carlisle's steward, and I got answers that were quite conclusive. They 'pooh-poohed' the system which was adopted in the forest to the greatest possible extent. But I thought, perhaps, in some of the other forests which were under my management I might find examples which would be unfavourable to my wishes. I therefore issued a circular letter to every deputy surveyor of those forests, to desire to know what was their system about felling a tree before or after it was barked; and if it was the pleasure of the Committee to call for their answers, they would find that their answers were uniformly against the practice in Dean Forest." We must not omit to observe that this resistance was not supported by Mr. Turnbull, the second deputy surveyor, although his superiors stood by with folded arms. On the contrary, being a man of intelligence and good sense, he did his best to support the introduction of a better system, for which we expect to hear that he is superseded.

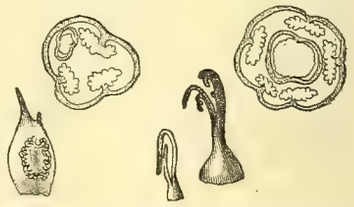
It is alleged by the forest officers that their system of stripping first and felling afterwards is necessary in order to give employment to the labouring population all the year round; but we think with Mr. Evelyn Denison, that there cannot be much difficulty in a forest of the extent of Dean, "where planting must be done, where draining must be done, and thinning must be done, to spread the labour over the year, without leaving trees standing upright through the summer to be cut in the winter," and Mr. Kennedy thought so too; but he also entertained the unpopular opinion that the measure of employment ought to be the interests of the place; and that there ought not to be expense incurred for the mere employment of the people, unless profitable to the forest.

We gather incidentally from other parts of the evidence before us that another reason for leaving barked trees standing, is that the quality of the timber is improved thereby. This is an old and common notion; founded upon the belief that sapwood is thus converted into heartwood. To what extent this preposterous opinion prevails among the pre-scientific race, we know not; but those who hold such views are of course prepared to admit that when a carcase is naturally dried up in the arid climate of Thibet, the skin and flesh are changed into bone. Others looking at the practice rationally suppose that to leave barked trees standing enables the timber to be more quickly dried or seasoned. Here we have a fair subject for discussion, and we hope our correspondents will communicate their views upon it. For ourselves we avow a doubt whether the rapid drying consequent upon leaving barked trees standing is really advantageous, considering the extent to which they are often rent and cracked by sudden exposure to air; and we also think with Mr. Brown, that it is also questionable whether any such drying as is supposed really occurs. In his report, dated Oct. 1, 1852 (31st report, p. 295), he observes:—"It is now a well-ascertained fact, that when a tree is to be cut down, and used as timber for any particular purpose, the quicker the natural sap can be extracted from it, the more likely is the wood to be durable. Now the system of stripping the bark from trees in their growing state, and allowing them to stand uncut for at least six months afterwards, instead of being a means of quickly expelling the natural sap of the tree, has quite the contrary effect. This is strongly exemplified in the case of the trees which have been this year stripped of their bark in Dean Forest while in their growing state; the operation does not entirely and at once deprive them of the principles of life, but that, as it were, lingers in the trees; their roots being in healthy action, continue to absorb moisture from the earth, and in consequence of the great evaporation that continues to take place on the whole stripped surface, the natural attraction between the boles and the roots of the trees goes on, and the sap continues to ascend even to the extremities of the smaller branches. This is evident from the fact that the trees continue to keep alive the greater portion of their leaves (this was the case when I inspected those thus treated in Dean Forest), for several months after they have been deprived of their bark. The natural consequence of this is, that these trees being kept continually in a half moist state by the ascent of the sap from their own roots, disease is more speedily brought on in their wood, than if that were cut and lying on the ground, subjected to the usual changes of the weather."

Can any of our practical correspondents show, from experience, what the real consequences are of the practice in question.

There is still another point relating to the bark question, namely, the mode of getting it off the trees: but we find so much difficulty in understanding the exact bearing of the evidence taken in this matter, that we must defer entering upon it for the present.

A very curious monstrosity of the common purple Foxglove has just been transmitted to us by Mr. J. Henderson, from Wentworth. It is of the same nature as the Wheat-ear Carnations, consisting of long spikes of bracts, the axillary buds of which are often again developed, and no part of the inflorescence makes any approach to its normal condition, except the carpels, which are more or less multiplied, while the styles alone present the usual tint of the corolla, and project from the ultimate bracts, their divisions being more or less incorporated below, but free above, and variously curled or curved. One striking peculiarity is that the placentæ are strictly parietal in the more perfect fruit, and therefore receding from the distinctive characters of the order, and approximating it to Gesneraceæ, while in the common cavity there is frequently a second bilocular capsule, the placentæ of which unite in the centre as in the ordinary capsules. On examining some of the upper bracts we were surprised to find the placenta arising apparently from the centre of their upper surface and not from the margin; but upon closer inspection we found that



two bracts were soldered together laterally, as was clear by the rudiments of two styles, the placenta being produced only at the two united edges, the outer margins remaining in the normal condition. This may possibly tend to the explanation of some cases of anomalous placentation, for the only indication of the true nature of the placentation is afforded by the two rudimentary styles, in the absence of which the spongy receptacle of the seeds must have been supposed to spring from the medial nerve. The compound carpel, too, is an instance similar to that of some monstrous Oranges, of the multiplication of the normal number of carpels by the production of carpel within carpel. As in the case just mentioned, the carpellary leaves of the inclosed capsules spring from the axis. It should be observed, too, that though the placentæ are parietal above, they are axillary at the base of the capsule, a striking instance of the facility with which axile placentation becomes parietal, the change being here effected by the prolongation of the axis, and the formation on it of a second whorl of carpellary leaves.

Our figure represents sections of a carpel formed of three and another of five leaves, the divided apex of the latter carpel and of the bilocular carpel which it inclosed, while on the left is a bract apparently bearing a placenta on its disc. All are more or less magnified. *M. J. B.*

VEGETABLE PATHOLOGY.—No. XLI.

180. The third substance is gum, which, according to its peculiar character, is sometimes soluble in water, buts ometimes, like tragacanth or bassorine, cerasine and pectine, merely swells when moistened. The formula of gum arabic is the same as that of common sugar, and the substance differs, therefore, merely in the molecular arrangement. That the two should in consequence be easily convertible may readily be supposed. If Cherry and some others which are sold under the name of gum, gum arabic at a low price, be placed in water, only a small portion melts, and this is called cerasine, which is probably nearly the same as bassorine. It is asserted by Kützing (Grandzüge, vol. i., p. 211) that the walls of the cells of certain Algæ consist of bassorine, and that in some Algæ, as Vaucheria, the older parts, which formerly consisted of cellulose, are converted into bassorine. This is, however, merely a part of his theory that all woody matter ultimately is converted into that substance. Its different chemical reaction is in part due probably to the absorption of nitrogenous matter from the protoplasm, and partly to its altered chemical condition. Pectine occurs in many fruits, and is the substance which causes them to form a jelly when boiled. The curious hypogæous bodies known in America by the name of Tuckaho, consist almost entirely of

pectic acid, and may be used for culinary purposes like isinglass. Several formulæ are given for pectic acid and a great many forms* are distinguished, but in all these there is in every case an excess of oxygen over hydrogen.

181. The last of the ternary substances is woody fibre, which forms the foundation of all vegetable cells, and in its purest state is cellulose $C_{12}\ H_{10}\ O_{10}$. It is the external wall only which answers to this formula, and according to Payen is identical in all vegetables. The lining membrane or lignine presents different formulæ according to varying circumstances, and in varying species. Woody matter is subject to decomposition from various causes, and in consequence the cell-walls of diseased tissues often assume a dark tinge, being impregnated with geates, ulmates, and humates, compounds of water, with their respective acids, with which ammonia acid is sometimes combined.† Wood itself, independently of disease, or the presence of fungi, is liable to decompose in damp situations, the residue always being richer in carbon than before, and as this consists of carbon and water, for every equivalent of carbon two equivalents of oxygen and hydrogen are removed. It is clear, therefore, that the oxygen of the air, which combines with the hydrogen of the wood, is replaced by carbonic acid, formed by the oxygen and carbon of the wood. Wooden structures, therefore, in which this process is going on, must be unhealthy from the deterioration of the atmosphere. When the wood becomes white, instead of brown, the spawn of fungi is always present, which appropriates its carbon. The cell walls are in this case said to be converted into bassorine.‡

182. But besides these ternary compounds there are others which contain nitrogen and sulphur. These are vegetable albumen, fibrine, and caseine, on the presence of which the nutritive qualities of vegetables in great measure depend. They have hitherto been called proteinous bodies, but the doctrine of Mulder on the subject is now called in question, and they may as conveniently be called nitrogenous; they resemble each other very closely in chemical composition, and contain always a small portion of alkaline or earthy phosphates, so that they are, in fact, extremely complex. All these bodies, under certain circumstances, absorb oxygen, which causes a rapid decay, accompanied by an offensive smell, and it is certain, inasmuch as this altered matter acts as a putrefactive ferment, that they are a fertile source of disease. In consequence of the similarity of their composition they are easily convertible into each other; indeed any one of them is convertible into the other two, for milk, which consists principally of caseine, eggs of albumen, and flour of fibrine, as far as blood-making materials are concerned, are each of them, by itself, capable of sustaining animal life, and, therefore, of supplying the other two essentials. They are identical, or nearly so, with similar substances in animals, on which account their presence in vegetables, which are ultimately the source of all animal nutriment, is indispensable for perfect nutrition. As a proof of their identity, cheese is prepared by the Chinese from the meal of Peas and Beans, which notoriously abound in caseine, which is separated by rennet exactly as curd is from milk.

183. Albumen exists in vegetables either in a fluid or solid form. It is a constituent of many seeds, but must not be confounded with the general name given to the firm or mealy body which so frequently protects the embryo, and affords it its first nutriment. The best analysis leads to the formula $C_{216}\ N_{27}\ S_2\ H_{169}\ O_{68}$; but this is not complete, as it contains other matters as above mentioned. If an emulsion be made of Almonds or Mustard seed, we have a diffused form of albumen. It gives rise to a host of different bodies by entering into new chemical combinations.

184. Fibrine, again, is found in the juices of many plants and seeds. The fruit of the Papaw is peculiarly rich in it, and it is contained abundantly in the gluten of Wheat and other corn, the viscid portion of which is known by the name of gliadine. The formula, exclusive of phosphates, is the same with that of albumen, into which it is readily transformed. Diastase is supposed to arise from fibrine by the action of water. Its curious effect on starch has already been mentioned.

185. Caseine in the vegetable world is found most abundantly in leguminous seeds, as Peas and Beans, which are, therefore, highly nutritive. In the seeds of many leguminous plants it is accompanied by a virulent poison, as in the common Laburnum. It does not coagulate spontaneously, as fibrine, or by heat, as albumen. Its formula, independent of phosphates, is $C_{288}\ N_{36}\ S_2\ H_{228}\ O_{90}$. All of these bodies when present in expressed vegetable juices or decoctions, attract oxygen, and then act as ferments. The employment of yeast, or the vinegar fungus, is merely with the intention of expediting the process in fluids, which might otherwise be sluggish. It is rarely if ever used in the manufacture of wine immediately from Grape juice. *M. J. B.*

* Frémy, who has written elaborately on pectinous matters, calls the original substance pectose, which occurs in the parenchym of unripe fruits, and to which their hard texture is said to be due. This in the process of ripening or boiling is converted into pectine, which is soluble in water, and does not form a jelly. Its formula is $C_{64}\ H_{40}\ O_{56} + 8\ HO$. When it assumes a gelatinous form (retaining the same formula), it is called parapectine. In over-ripe fruit it acquires still other forms. He also finds with these a substance which he calls pectase, analogous to diastase, and like that producing chemical change. (I have only Græger's translation of the memoir.)

† Crenic and apocrenic acids arise equally from decayed vegetable matter, and contain nitrogen. The combination of these bodies with ammonia is of great consequence as regards the nutrition of plants.

‡ See Kützing Grundzüge der Philosophischen Botanik, v. i. p. 207.

GESNERAS.

When well managed these are very handsome plants, which, owing to their accommodating habits, are particularly well suited for amateurs, or persons having but small house-room. G. zebrina, which I need not say is one of the best of them, may be had in bloom at almost any period of the year; but it is most useful for autumn and winter flowering, and for this purpose few plants are more useful.

Like Achimenes, Gesneras increase sufficiently fast, by means of their under-ground tubers, to render artificial propagation unnecessary, at least in the case of ordinary growers. If it is desired to have flowering specimens in autumn and early winter, the tubers should be carefully separated from the soil in which they have been wintered, about the beginning of March, and planted rather thickly on the surface of well drained pots or pans, filled to within about 3 inches of their surface with any light peaty soil, from which it will be easy to separate the roots without injury, and covered 2 inches deep. Give a gentle watering, to settle the soil about the tubers, and place them in a warm growing temperature of about 65° or 70°. Until the plants appear above the soil no more water should be given than may be necessary to preserve the soil in a moist healthy condition. As soon as the plants are from an inch to 2 inches high they should be separated and repotted. I use shallow 8-inch pots, and place five plants in each; but the number of plants in a pot should be regulated by the taste and convenience of the cultivator. With proper management one plant in a pot will form a very fine specimen; but, to effect this, more care and time are required than when five plants are put into a pot, and the latter form larger specimens than it is possible to obtain by having only one plant. After potting, keep the atmosphere close and moist, and give very little water at the root until they start into growth. When the pots are moderately well filled with roots, shift into the flowering size. For single specimens, 10-inch pots will be sufficiently large; when three plants are used, 12-inch pots will be necessary, and 13-inch pots in the case of five plants. Keep close and moist, and carefully avoid over-watering till the roots can penetrate the fresh soil. A high temperature during summer is rather injurious than beneficial in the culture of this plant; 50° or 60° at night, allowing it to range 10° or 15° higher with sun heat, will be most conducive to strong vigorous growth, and the production of handsome specimens. The plants should be placed near the glass, so that they may receive as much light as can be afforded them, but it will be found necessary to slightly shade them during bright sunshine, and the atmosphere should be maintained in a thoroughly moist state; but this must not be effected by excluding air and close shading, otherwise the plants will assume a sickly, drawn appearance, and the foliage will be thin and ill-coloured. The shoots may be neatly staked, as soon as they are high enough to be liable to be broken. The stakes used may be cut off at the height of about 15 inches, which will be sufficient for the support of most of the plants; the flower-spikes will require no support, and if the plants are kept near the glass, and frequently turned round, they, too, will probably need no staking, to cause them to assume the desired form. G. zebrina has a tendency, under high cultivation, to produce flower-spikes at the axils of the leaves, and it will generally form a more showy specimen in this way than if stopping is resorted to; but when only one plant is used as the foundation of the specimen, it may be advisable to stop once, when about 4 inches high. An occasional watering with clear manure-water will tend very much to promote vigorous growth; but this will be unnecessary till the plants have pretty well filled their pots with healthy roots.

When the blossoms begin to be developed, the plants may be removed to the conservatory or greenhouse; but they must be gradually prepared for the change. Great care should be used to prevent their sustaining any check, and they should be guarded from currents of cold air after their removal. A temperature of from 45° to 50° at night will be necessary during the whole of the blooming season, if the plants are expected to increase in size and beauty for some two months together.

When they show symptoms of decline, water should be gradually withheld; and when the foliage and stems die down, the pots should be placed in a situation where they will be free from damp and frost; unless the tubers are well ripened, they should not be placed in a lower temperature than 45°. A rich friable soil is essential to the production of fine specimens of Gesnera. I find light sandy turfy loam, rich fibry peat, and thoroughly decomposed cow-dung, in about equal proportions, adding a sufficient quantity of sharp silver sand, to insure the free percolation of water through the mass, to suit well. The loam and peat need not be broken up into very small pieces; but the dung should be passed through a fine sieve, to catch the worms, which it almost always contains. I ought to state that there are two varieties of Gesnera zebrina in cultivation, the one having thin ill-coloured leaves, and in every way much inferior to the other; therefore beginners should take care not to purchase the worthless variety, which, however, is fortunately not very common. *Alpha.*

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

(Meeting at Liverpool, Sept., 1854.)

Section B: Chemical Science.—*On the Influence of the Solar Radiations on the Vital Powers of Plants growing under different Atmospheric Conditions.* By Mr. J. H. Gladstone.—This was the second report given by the author under the same title, and commenced by describing accurately what portions of the prismatic spectrum were cut off by the various coloured glasses employed in his experiments. A series of observations followed on Hyacinths grown under very varied influences of light, solar heat, and chemical agency. Among the results may be mentioned the power of the yellow ray to diminish the growth of rootlets, and the absorption of water; the power of the red ray to hinder the proper development of the plant; and the effect of total darkness in causing a rapid and abundant growth of thin rootlets, in preventing the formation of the green colouring matter, but not of that of the blue flower, nor of the other constituents of a healthy plant. A series of experiments on germination was then detailed. Wheat and Peas had been grown without soil under large colourless, blue, red, yellow, obscured colourless, and obscured yellow glasses, and in perfect darkness. The effects resulting from these varied conditions were very marked; and the description of them occupies a considerable space in the report. The two plants experimented on—being chosen from the two great botanical divisions—exhibited a wide diversity, sometimes amounting to a direct opposition, in their manner of being affected by the same solar ray; but in the case of both the plants, under the circumstances of the experiment, the following effects were observed:—The cutting off of the chemical ray facilitates the process of germination, and that both in reference to the protrusion of the radicles, and the evolution of the plume; the stem grows unnaturally tall, and there is a poor development of leaves in darkness, becoming more manifest as the darkness is more complete; and the yellow ray exerts a repellant influence on the roots, giving the Wheat a downward and the Pea roots a lateral impulse. A few experiments on the germination of other seeds were then narrated; and the report concluded with an account of experiments on the germination of Wheat and Peas in oxygen, hydrogen, and carbonic acid gases, as well as in ordinary atmospheric air, and in air from which carbonic acid was at all times certain to be removed. The results confirmed former observations on the necessity of oxygen.—Professor Miller, in thanking the author for his valuable researches, made some remarks on the interesting results that the investigation had brought to light; and drew especial attention to the remarkable fact stated in the paper, that the blue rays retarded the action of germination at first, although they probably accelerated the growth of the plant afterwards—the act of germination being attended with the absorption of oxygen, but the process of development being, on the contrary, attended with the extrication of this gas.—Professor Anderson remarked that a similar difference in the rate of growth of the leguminous plants and Grasses to that described by Mr. Gladstone had been observed when they were manured with the same material. Nitrate of soda, which was found to be an excellent fertiliser for Grasses, had comparatively little influence upon leguminous plants.

On the Artificial Preparation of Sea Water for Marine Vivaria, by Dr. G. Wilson.—The paper was a criticism on a communication made by Mr. Gosse, and contained in "The Annals of Natural History." Guiding himself by Schneitzer's analysis, Gosse employed chloride of sodium, sulphate of magnesia, chloride of magnesium, and chloride of potassium. Into a mixed aqueous solution of these salts Gosse introduced various species of marine plants and animals; and for six weeks they throve and flourished. Dr. Wilson considers, however, that the less abundant, but still essential, constituents of sea water—such as carbonate of lime, sulphate of lime, phosphate of lime, fluoride of calcium, silica, iodine and bromine—should not be absent, as these latter substances are found in marine plants and animals; and it is therefore plainly evident that the medium in which they live ought to contain the same substances. It is, of course, quite possible that in a single aquarium the death of a certain portion of the animals might furnish calcareous salts, &c., for the growth and preservation of their survivors; and in like manner the death of a given number of plants might liberate iodides, bromides, &c., for the remainder. But this destruction of part of the occupants of the aquarium for the preservation of the other part might be easily avoided, as calcareous phosphates, carbonates, and fluorides occur together in shells, corals, and many limestones. The arrangement of fragments of such calcareous bodies at the bottom of the aquarium would supply some of the missing ingredients; whilst pieces of trap rock and a few grains of an iodide and bromide would afford the remainder.

Mr. Warrington gave an account of some experiments he had made on the influence of coloured glass on the growth of plants in sea-water. He found the red sea-plants grew best in glass cases coloured green, and that green Confervæ were thus destroyed.—Mr. Huxley made some remarks on the general theory of harmony and adaptation in nature. He thought naturalists were too much disposed to take it for granted that beauty was an end in creation. He believed, on the contrary, that grotesqueness was frequently an object, and that inharmonious and in-

apposite colours and forms were purposely brought together, and thus excited the feeling of the ridiculous. —Dr. Carpenter called attention to the fact, that different chemical conditions of the plant produced chemical colours; and the point to be ascertained was whether these were subservient to the laws of harmony sought to be established.

Home Correspondence.

Sulphur and Water, with a little Lime in it, v. *Mildew.* —In a small Vinery here, 34 feet long, two Vines were planted, one at each end; three shoots were trained horizontally from each other alternately. At the end of five years the shoots from each had nearly reached the opposite ends; they have been spurred and have borne abundant crops every year, a little fire heat has been used, and the fruit ripens generally about the middle of August. In June 1852, although it will be observed the Vines were trained horizontally, mildew made its appearance in spots all over the house; a little sulphur was used, but the disease increased over every shoot, leaf, and bunch, and the Grapes were nearly all useless. Again in June 1853, the mildew made its appearance, sulphur was more liberally used but the disease increased, although checked a little, and the bunches were all affected. This year, 1854, early in February, the house was washed with lime-water with a little sulphur in it, every available piece of plaster and brickwork, the flue included, being operated on; in June, the same suspicious spots of mildew made their appearance; in the evening, when the flue was just hot enough to bear the hand on it, it was done over with a mixture of sulphur and water, with a little lime in it, and again repeated at a week's end. The mildew entirely disappeared, and the Grapes ripened at the usual time, an excellent crop. The idea of washing the flue with sulphur was taken from an article in your volume for 1853, and I think it is an invaluable receipt. *D. S., Woodbridge, Suffolk.*

Abelia uniflora.—The management of this really pretty hard wooded greenhouse plant is very simple, and although it is considerably less vigorous in habit than A. floribunda, it flowers much more freely than that species, producing, when well grown, its delicate purplish-white Pentstemon-like flowers in profusion. Cuttings of this Abelia, selected from the half-ripened wood, root readily in the propagating house, if inserted under a bell-glass not later than the middle of October. The contents of the cutting-pot should be one-third crocks for drainage, one-third finely-sifted peat and sand, surmounted by an equal quantity of clean silver sand. By the second week in November the cuttings will be sufficiently rooted to dispense with the bell-glass; the young plants should then be gradually inured to light and air, preparatory to being removed to their winter quarters, on a shelf as near the glass as may be convenient in an airy part of the greenhouse, where, if proper care be taken not to over water them, by the first week in the following March the young stores will have acquired sufficient strength to be potted singly into 3-inch pots. For compost use two-thirds turfy peat and one-third sharp sand. After potting, and until the roots begin to penetrate the fresh mould, the plants should be kept close, after which they can be removed to the platform or stage of the greenhouse. They will now commence growing freely, the pots will become filled with roots, so as to require a second shift into 5-inch pots. The same compost as before should be again employed; pot firmly, and drain well. The plants should be neatly staked and tied out, and should be re-arranged in their former situation. They will now require plenty of water and a constant supply of air; and in order that the future specimens may exhibit a stocky and furnished appearance the laterals should not be permitted to grow (without being stopped) any length beyond what the intended shape of the plants require. Pursue this course until the middle of the following August, when the final shift for the season may be given with safety, using 6-inch pots for the purpose. They should be allowed to complete their growth, and be wintered in the greenhouse. Treated as above, this Abelia may be had in full bloom by the end of the following May, and it will continue to produce a good supply of flowers during the three succeeding months. *R. Miles.*

Thornham Village Horticultural Society.—I perceive that one of your correspondents has given you a description of the Hitcham Village Horticultural Society's second meeting; perhaps you will allow me to say a few words about another meeting of the same kind, at which, by the kind invitation of the noble lord by whom it is supported, I was a visitor. I will remark, by way of preface, that the few observations which I send you have not been written with any desire to communicate mere newspaper news or gossip; neither is my object that of bringing before the public eye the names of those who so kindly and well arrange, and take a prominent part in these meetings, for I feel conscious that while all our best and grateful thanks are due to them, this should rather be expressed by zealous co-operation than by laudatory comments in the public press. The autumnal meeting of the Thornham Village Horticultural Society was held in the grounds of Lord Henniker, on Wednesday the 4th inst., and was attended by a large party of the gentry and clergy of the neighbourhood, many of the tenantry, and nearly all the labourers and their wives and children, in the two parishes of Great and Little Thornham. The show of the villagers' productions was by far the best of any which has been held since the establishment of the society. The past season has certainly been a magnificent one for most of the productions of the garden. I heard a clergyman remark a few days ago, that during the last 14 years this (with one other exception) is the only year that his Peaches have ripened; and I can say, with equal truth, that this is the only year in the last 20, that I can remember eating a ripe Ribston Pippin in the beginning of October, and that was in the first prize of dessert Apples at this show. The exhibition of Potatoes was truly splendid, by far the best I ever saw at any Horticultural show; and in these useful productions a fair inference may be drawn of the excellent effect which competition has in the horticulture of the poor. They not only learn to grow well, but they are taught to grow the best kind of vegetable. They find that a Potato unequal on the surface is rejected by the judges for the smooth skinned sorts which do not lose in peeling. In Onions, again, the same thing was observable. Instead of the large, coarse, thick-necked things which were at first thought the perfection of skill, in the 20 or 30 plates exhibited here the specimens were remarkable for their quality, as the gardeners termed it—symmetrical forms, their clean skins, and thin necks were the order of the day. The Apples, too, were very fine, and I wished much that I were able to gather as good fruit in my own orchard as I saw exhibited here. Among other things there was a fair show of Carrots, Kidney Beans, and Pumpkins, but a falling off in Cabbages and Parsnips. I would suggest that in future prizes be offered for the best Cabbage instead of the best three. After all the judges only cut one. In Parsnips I have observed a general falling off this year. There was a good display of Wheat and Broad Beans from his lordship's allotment tenants. On the whole the exhibition was remarkably good. After inspecting the productions the visitors sat down to luncheon in the corridor, and then adjourned to the quadrangle, where the cottagers being collected together were addressed by Lord Henniker, and their prizes given with a kind word to each. This part of the proceedings being over the party adjourned to the front of the house, where our old and valued friend Professor Henslow was prepared in full force with one of his amusing and instructive lecturets. The day being fine the cover was thrown off the tent containing his treasures, and instead of being crowded by his bearers he had all the stage to himself. Lord and Lady Henniker, surrounded by their youthful family and a large party of visitors, occupied the left of the foreground, while the tenantry and labourers were grouped in front. The scene was eminently picturesque and suggestive. Mr. Henslow, surrounded by his numerous specimens and illustrations (among which I ought not to forget to mention the promised specimen from Africa by the Bishop of Natal), commenced his lecturet by giving a very clear and succinct account of the process of printing, then passed rapidly over a great number of illustrations, having something new and useful to say about each. Among them I may mention the manufacture of the Tunbridge Wells' inlaid wood-work — of different ornaments in shell work—how to make artificial Grasses with indigenous mollusca—and the process adopted by Messrs. Ransome & May in making the wooden pegs by which the iron chairs on our railroads are secured, the principle being great steam compression of the wood, which swelling when fixed, from the absorption of moisture, forms a secure and lasting means of attachment. Several illustrations from the insect and vegetable world were then shown. Among the latter, drawings of Palm trees, and the exhibition of their various fruits, gave Mr. H. an opportunity of describing the whole process of making Price's candles! illustrating his remarks by about 20 large glass jars filled with the various products of the manufacture. This was all most interesting and instructive. Some beautiful bird cases, exhibited by Lady Henniker, and a collection of Indian curiosities by his lordship, were then shown, and the whole was wound up by an explanation of a series of magnified drawings of the diseases of corn plants—bunt, bladders, smut, rust, ergot, mildew, &c., and were each shown and explained. Three-times-three cheers were then given for Mr. H. and Lord and Lady Henniker, and the meeting dispersed—I need not say much pleased and delighted. Youthful races, a greased pole, and various other gymnastic eccentricities, were then enacted by the rising generation; while those who had already risen we observed discussing good old English fare, roast beef and ale, on the tables which had just before groaned with the illustrations of science—not the worse, I ween, for knowing something about the enemies which might, if not checked, deprive them of this bread—or for having had brought before them so many instances of that beautiful design and unerring wisdom which is stamped on the works of creation. I may be permitted to hope that the excellent example of Lord and Lady Henniker and Professor Henslow may find many imitators. I am sure society is much indebted to them for extending the area of social enjoyment, and endeavouring to promote the happiness of their fellow-creatures. *B.*

McGlashen's Transplanting Machine.—On the 28th ult. Mr. McGlashen had the honour of exhibiting his apparatus in its most improved form, in full operation, in the palace grounds at Balmoral, in presence of H.R.H. Prince Albert, the Hon. Eleanor Stanley, Major-General Charles Grey, Colonel Phipps, the Baron Stockmar, and Dr. Robertson. Mr. McGlashen first showed the simplest form of the invention, viz., that adapted for transplanting herbaceous plants, with which he lifted a plant of common Heather, with an adherent ball of earth 9 ins. in diameter. He then applied a machine with four spades or cutters, with which he lifted a tall Poplar tree, with an adherent ball of earth 22 inches square. By adding four other spades to those used in this operation, the apparatus was in a few minutes converted into one suitable for lifting a ball of earth 4 feet 8 inches in length, by 3 feet 5 inches in breadth; and with it he proceeded to operate upon a fine Birch tree, about 20 feet in height. The cutters being driven in and the apparatus adjusted, the tree was speedily raised out of the ground, with a fine ball of earth around its roots, the operation being conducted by Mr. Paterson, her Majesty's gardener at Balmoral, with the assistance of two workmen. The Prince was greatly interested in the invention, and with the satisfactory manner in which the work was performed. In the course of the different experiments his Royal Highness remarked to Mr. M'Glashen that he perceived several important improvements had been made in the apparatus since its exhibition in the London Horticultural Society's Garden, 18 months ago, when a Poplar, 55 feet in height, was successfully transplanted. While preparations were being made for lifting the Birch tree, his Royal Highness took up one of the small-sized transplanters (adapted for removing herbaceous plants) and, having lifted with it a young Poplar tree, remarked the great facility with which the operation was performed. The large Birch was afterwards conveyed by the improved transplanting carriage (drawn by a horse) to a distance of a quarter of a mile, where it was safely replanted. Notwithstanding the roughness of the road, the conveyance of the tree was effected with great ease, the construction of the carriage being such as to require comparatively less strength for propelling a given weight than an ordinary cart. The whole of the experiments were so highly satisfactory that his Royal Highness gave orders for the immediate purchase of the apparatus employed on the occasion, for use on the Balmoral estates. Dr. Robertson (her Majesty's Commissioner) was likewise highly pleased with the invention, and ordered a transplanter for use on his own property. From this account of the experiments, it will be seen that the machine used at Balmoral is applicable to various sizes of trees. When all the spades are used, it is adapted for lifting trees with a ball of earth 4 feet 8 inches long by 3 feet 5 inches broad; and, by using only four of the spades, a ball of 27 inches square may be raised with equal facility. It is not only to the transplanting of trees that this apparatus is applicable. The carriage (without the spades) can in a few minutes be converted into a machine for clearing ground of the stumps or roots of large trees, and it does equally well for raising stones or blocks of rock, without blasting or digging a trench around them, and they can be conveyed to any distance by the same machine as that with which they are lifted. The Balmoral machine is suited for raising tree-roots or blocks of rock from two to three tons in weight. But as trees of any size can be transplanted with perfect safety by machines of larger size, so in like manner stones or blocks of rock of any weight can be raised by having the carriage of corresponding size and strength. *G. L., Edinburgh, October 5.*

Notices of Books.

Scenery, Science, and Art; being Extracts from the Note-Book of a Geologist and Mining Engineer, by Professor D. T. Ansted. London, Van Voorst; 8vo. pp. 323.

The present volume, from the pen of Professor Ansted, contains an interesting and agreeably written account of some important observations made by him when travelling in France, Switzerland, Germany, Spain, Sardinia, Algiers, and the United States. The geology of these countries, and particularly their mines, attracted the author's especial attention; but he by no means neglected other matters, whether relating to natural history or the social condition of the people amongst whom he moved. The notes are evidently those of an intelligent and well informed man—very different from those ordinary productions which so-called travellers think it necessary to lay before the public after every excursion across the water. The chapters on Spain, Algiers, and Sardinia, are amongst the most interesting to the general reader. The former of these countries is always allowed by those who have travelled in it to be far more worth visiting than many places, not more easy of access, to which our countrymen flock in the autumn. Intolerable heat and dust, bad roads, the monotony of a great portion of the country, and the wretched accommodation in out of the way places, not to mention a lurking dread of banditti, are however causes sufficient to keep those who travel for pleasure away from Spain. Several passages might be extracted from the pages before us which would be quite enough to determine the choice of a hesitating person in favour of some other country, even with fewer objects worthy of attention; our space, however, compels us to pass by such matters. The climate of a great part of Spain is remarkable for excessive heat and severe cold. As this subject is interesting in a horticultural point of view, we give the author's remarks in full:—

"It may be well to add one word with regard to the climate of Northern Spain and Madrid. It has often been described as affording every variety of temperature in the shortest possible time, and certainly has not been wronged. I left Bordeaux and reached Bayonne on one occasion during weather so intensely hot, that it

was scarcely endurable even by those most accustomed to heat. The inhabitants wisely kept in-doors, with closed windows and shutters, and slumbered through the noonday heat as well as possible. On entering the mountains there was rain, but the heat was still scarcely endurable. After travelling some distance, and as we emerged on the table-land on the other side of Pancormo, the heat had changed to cold, which during the night was so great, that the conductor had to wrap himself up in his furs and warm cloak, and endeavour to forget it in sleep. Afterwards, in crossing the Somo-Sierra, we had a thunder-storm, accompanied with hail and torrents of rain, more violent than I have often seen, and on entering Madrid I found that the heat had been and was intense and suffocating. Four-and-twenty hours, however, produced there a change so great that it was disagreeable to walk in the streets without an overcoat, although still the sun when shining was too powerful to be at all pleasant. These violent alternations of heat and cold are quite characteristic of high table-lands, especially when, as in Spain, they are bounded by lofty mountain-chains, rising here and there above the line of perpetual snow, and not so distant as to allow of the winds blowing from them to become warmed. In the Peninsula, indeed, the central tract consisting of high and almost unbroken table-land and the coast being mountainous, there is constantly a current of hot air rising during the summer from the bare and heated earth, and this is replaced by cold air rushing down from the mountains. The almost total absence of trees and forest vegetation exaggerates to the highest extent the evils arising from excessive temperature and rapid changes in this respect, so that now it would be difficult, without much time and labour, to replace the trees that probably at one time abounded in certain districts. Something might be done in the vicinity of the capital; but the Spaniard hates trees, and seems nowhere at home but on a trackless plain or in a treeless desert."

Whilst in Algiers Professor Ansted visited a large nursery, established some years ago, under the superintendence of Mr. Hardy. "It is a most charming and interesting locality, and cannot fail to be of the greatest benefit to the colony. It is situated about three miles from the town, towards the south, and close to the sea, being well sheltered by the high ground rising on three sides, but having perfect ventilation. In this garden we find large groves of Plantains, the fruit of which is sold by public auction. There are also extensive groves of Orange, Lemon, &c., numerous Palms of different species, all fruiting and ripening their fruit in the open air, the Ficus elastica growing to a great height, the Dracæna, Yuccas, and numerous other South American, Indian, and other trees which we are accustomed to see only in hothouses. Thus their appearance for the first time in the open air makes one fancy the climate far more tropical than it really is. I noticed numerous species or varieties of the common Cactus (Opuntia), so abundant in the south of Spain, and many other remarkable forms of plants not uncommon in the warmer portions of Europe. The important part of these gardens consists, however, strictly, in the nursery, as hence are obtained the Cotton-trees and many of the Mulberries, of which thousands are conveyed to favourable positions every year; here has been grown, so as to ripen perfectly, the Tea-plant, and here also are performed many important experiments calculated to throw a light upon various points on which the interests of the colony may depend. The general arrangement and condition of the garden are in the highest degree satisfactory."

On America the most interesting and important note is that on slavery. The author endeavours to show, by a "dollar and cent." calculation, that free labour is more advantageous to employers than slave labour; and his remarks upon this subject well deserve the perusal of those who, excited by the pathetic tale of "Uncle Tom," would by a stroke of the pen set free the black population of the southern States.

Four well executed lithotints by Messrs. Day and Son, and 21 woodcuts, many of them illustrating the geology of the places described, add much to the attractive appearance of the volume; whilst a good index renders it permanently useful as a work of reference.

New Plants.

93. Pinckneya ionantha, *Planch. and Linden.*

"A magnificent Cinchonaceous plant allied to Mussænda and Calycophyllum, and like them remarkable for having a calyx divided so as to resemble a stalked petaloid leaf, and which might at first sight be taken for a bract. The calyx of the present plant is bright purple passing into violet. The corolla, which is about an inch and a half long, is dark violet. The flowers form large terminal corymbs. It is a native of New Grenada, where M. Schlim discovered it on the burning banks of the Rio Magdalena, in the province of Mompox." *Linden's Catalogue*, in which it is priced at 25 frs.

94. Lycaste costata. *Lindl in Bot. Reg.*, 1843. *Misc. p.* 16.

This fine species, originally described from a dried specimen found in Peru, by Mathews, has just flowered with Robert Hanbury, Esq., who received it from the Cordilleras. With the habit of *L. gigantea*, it unites pure green fleshy flowers of the following dimensions:—Sepals, 2½ inches long by 1¼ broad; petals rather smaller; chin, ¾-inch, straight, almost cylindrical, and of the same length as the ovary, which is entirely concealed by an ovate hooded green bract, which reaches about one-third part up the dorsal sepal. The lip is yellowish white, with a roundish fringed middle lobe, half ovate acute lateral lobes, and a very conspicuous truncated ribbed white appendage. As usual in this genus, the lower face of the column is shaggy, with white hairs.

Garden Memoranda.

Basing Park, the Residence of Joseph Martineau, Esq.—During a short excursion through the eastern part of Hampshire, I availed myself of the opportunity, when in the neighbourhood of Basing Park, to visit my old friend and schoolfellow, Mr. Duncan, who has for many years resided there, and conducted the various alterations and improvements in the gardens and grounds, that have justly obtained for them a wide celebrity. To those who happen to be unacquainted with the locality of Basing Park it may be proper to mention that it is a little to the left of the road from London to Gosport, about 7 miles from the pretty rural town of Alton, so well known for its pure and delicious ale—and the same distance from Petersfield. The house is a modern structure of good elevation, and pleasantly situated, commanding some delightful views of the surrounding grounds, which are much undulated and well covered with wood. At the entrance to the park from the Gosport road a very handsome and commodious lodge has been lately erected, in which great attention has been paid to the comfort and requirements of those who may occupy it. The approach from this lodge to the house is nearly a mile and a half in length, and has been very skilfully executed; the line appearing to sweep through the park in the most natural, easy, and direct course that could possibly have been selected for showing to advantage the beautiful glades and rich woodland scenery with which it abounds. The soil appears to be a sort of clayey loam, or chalk, thickly interspersed with flint; so much do the latter predominate in some places that it becomes a matter of surprise how the vegetation that conceals them is supported. On either side of the road the masses of plantation have been arranged with much judgment and good taste. The situations they occupy have been happily chosen, both with reference to their general appearance in connection with the older wood in the background, and as forming distinct groups. From their boundaries having been made to follow the easy undulating form of the ground on which they are placed, they display an intricacy and variety of outline that is exceedingly pleasing, and which it is the great aim and ambition of the landscape gardener to produce. Indeed, I question whether the late celebrated Gilpin, who was acknowledged to be a master of his profession, and an accomplished artist, could have made a better use of the materials, or created a series of more beautiful landscapes, than has been done in this instance by Mr. Duncan.

The gardens and pleasure ground immediately adjoin the house. They are tastefully laid out, and kept in excellent order, which render them at all times enjoyable, and a never failing source of amusement and delight. The symmetrical garden to the east of the mansion, with the ornamental fountain in the centre, has a fine effect, the beds being well proportioned, and filled with a variety of gay flowering plants, among which I particularly noticed Ageratum cœlestinum, Calceolaria amplexicaulis, Tom Thumb and other showy Geraniums, Salvia patens, &c.; the latter, when planted thickly and pegged down, makes an excellent bedding plant. Some of the beds had an edging round them of the double white Achillea ptarmica, a plant which seems to be well adapted for this purpose, or even for making a bed of itself, the flowers being neat and showy, produced in abundance, and continuing a long time in perfection. There is one peculiarity in this garden I do not remember to have seen before, and, on account of its novelty, as well as the use that may be made of it by others, I think it is especially deserving of being noticed—it is that of employing a small narrow strip of fine old turf, by way of edging to the several flower beds, instead of Box. The kind of turf used is selected from some old sheep walk, where the herbage generally consists of Festuca ovina, and similar fine leaved Grasses. It had a neat appearance, and, I was told, completely answered the purpose for which it was intended, and was easily kept in order. Here, as well as in other parts of the pleasure ground, masses of Rhododendrons and other evergreens occupy those places where they are considered to be most requisite, not only for the sake of ornament during the early summer months when in flower, but to create variety and afford shelter during winter. Large vases, elevated on suitable pedestals, are dispersed through the grounds, and meet the eye in various directions. A number of these tasteful objects are ranged along the terrace in front of the principal apartments, and have a charming effect when filled with flowering plants as they are during summer. The conservatory is contiguous to the house, with which it has been made to harmonise and appear to form a part. It is about 60 feet long, very spacious and lofty in proportion, displaying to advantage the various large specimens it contains of New Holland plants, Camellias, Brugmansia, &c., that are so valuable for winter decoration. Immediately in front of the conservatory, but on a much lower level than that of the terrace on which it stands, is another fountain with numerous flower beds surrounding it, so arranged as to produce the most agreeable contrast and variety in the colour of the flowers with which the beds are filled. Standard Roses occupy the outer circle. Many of these appear to have suffered much from the frost of last winter, and some of the more tender kinds seem entirely destroyed.

The kitchen garden is on the west side of the house, close to the pleasure ground, to both of which it is very conveniently situated. The soil is a cold stiff clay, by no means favourable for the growth of vegetables or fruit trees. The latter, I was given to understand, were liable to canker, unless frequently removed, and their roots prevented from getting down into the subsoil. Wire trellises are used for the purpose of training the espalier Apple and Pear trees. Over the principal walk in the centre of the garden is an arched trellis, with the trees trained against it, which has a very pretty effect, and is worthy of being generally adopted. The forcing houses are placed against the north wall. They are 300 feet long, and well adapted for the purposes to which they are severally applied. As a Pine and Grape grower, Mr. Duncan has been long known to be eminently successful. Of this there could be but one opinion, after seeing the luxuriant state of the former, with their large and handsome fruit, and the magnificent Grapes with which the Vineries were loaded. Similar productions are not often met with, unless perhaps at the Chiswick exhibitions, where none but the most perfect specimens of good cultivation and horticultural skill are brought forward. Mr. Duncan pays great attention to his Vine borders, and is a strong advocate for liquid manure—for which he has made such arrangements as afford him an abundant supply. But the most remarkable feature at this place in the way of hothouses is the large glass structure erected some two or three years ago against the south wall, and which, for want of a better name to distinguish it, I think might be called the Fruitery. It is 300 feet long, 17 feet wide, and of proportionate height, with numerous openings at the back, both top and bottom, and moveable sashes in front for the purpose of ventilation. The latter are so constructed that, by means of a very simple piece of machinery attached to an iron rod carried along the front of the house, 100 feet in length, may be opened or shut by the mere turning of a handle. An arched iron trellis occupies the centre, and extends from one end of the house to the other; against this trellis, as well as the back wall, are trained the various trees whose fruit are most in request by the family. These comprise Vines, Figs, Peaches, Nectarines, Plums, Apricots, and some of the best sorts of winter Pears. No artificial heat is given, the object in view being to prevent the disappointment so frequently caused by the late spring frosts in this part of the country, where it is by no means unusual, after the trees have been covered with blossom, and given promise of an abundant crop, to have the whole destroyed in a single night, and that, too, at a period of the year when the fruit was supposed to be out of danger. Nothing of this kind is now to be apprehended, the glass covering having been found to answer its purpose most effectually, and the quantity of fruit that was in the house afforded a convincing proof that the idea was a good one admirably carried out, and attended with the most complete success. It is to be hoped that Mr. Duncan will one day favour the public with a plan and description of this fruitery, which is both ornamental and useful, far surpassing anything of the kind that has yet come under my notice. Another interesting feature here is the evergreen garden, which, in addition to a fine collection of Coniferous plants, contains a variety of other hardy trees and shrubs that are evergreen, such as Ilex, Buxus, Cotoneaster, Mahonia, &c. It is of considerable extent, and laid out in a style no less remarkable for its originality than for its beauty. Owing to the specimens being all labelled, and the walks so arranged and varied as to separate the different sections of Coniferæ from one another, an excellent opportunity is gained for examining and comparing the several species of which each section is composed. The Grass on both sides of the walks is kept neatly mown, while the rest of the ground is thickly planted all over with Laurels and Mahonia repens, to serve as a cover for game.

Such is a brief sketch of the principal objects at Basing Park that are likely to interest the gardener. Before concluding, however, I must not omit to notice the great improvement that has been recently made by the formation of an approach from the Petersfield road to the house—a distance of about two miles. Like the one from the Gosport road, it is both contrived and executed in a superior manner, and I think will be allowed by all who are acquainted with such matters to be a fine example of Mr. Duncan's taste and ability in this branch of his profession. Nor ought the lodges to be passed over without remark, as they are in my opinion perfect models of what such buildings ought to be—neat and expressive in design, substantially built, and well finished, altogether forming a very striking and agreeable contrast to the low and unhealthy dwellings denominated lodges, that are so frequently seen in other parts of the country. In this respect it is but right to state that great improvements have been made of late in this class of buildings, since the attention of our large landed proprietors has been directed to the subject; but very much still remains to be done, and it is to be hoped that many of them will be speedily induced to follow the excellent example which has been set them by Mr. Martineau. *W. E. B.*

FLORICULTURE.

Double Primulas.—These are amongst the most useful subjects for winter decoration which we possess, and should be extensively cultivated wherever winter plants are in request. With proper management they grow freely enough, and produce a profusion of their pretty blossoms from November till March, or even longer. Unfortunately, however, they are rather delicate subjects, and although they are found growing vigorously and flourishing about some places they are still comparatively scarce, and many amateurs complain that they can do no good with them. I will begin with their propagation, which, owing to the cuttings being very apt to damp off, is somewhat difficult; indeed I have known many parties lose their whole stock through inability to propagate them. Good strong robust plants should be selected to furnish cuttings, and these should not be allowed to flower too long, but the flower stalks should be cut off before the plants show any symptoms of exhaustion, removing them to a rather warm situation to encourage free growth. As a general rule the plants should be divested of their flowers from the middle of February to the middle of March, for if placed in heat earlier, unless a dry atmosphere can be commanded they will be liable to damp off, and without careful attention to shading they will not be found to grow so freely after the sun becomes powerful. The plants must be narrowly watched after placing them in heat, keeping them as moist as can safely be done, but they should not be syringed too freely over head, for if damp once makes its appearance it will be difficult to check it without removing the plants to a cool, dry atmosphere, which would check their growth, and cause a serious loss of time. If the pots are well filled with roots a small shift may be given with advantage, but if, as is more commonly the case, the plants are over-potted, they should be turned out of the pots carefully, clearing away all unkind soil, and repotting in pots just sufficient to admit the roots with a very small portion of fresh soil. Under any circumstances water must be very carefully supplied, giving just enough to keep the soil in a healthy state; and if any indications of damp are perceived on the foliage, or about their neck, then give water by means of a saucer, and allow the surface soil to get quite dry. With anything like proper management, however, the plants will grow very freely, and will soon furnish an abundance of cuttings. When the young shoots become moderately firm, which will be known by the stems changing colour, these should be cut off close to the main stem by means of a sharp knife, leaving a few shoots so as to make sure of saving the old plants, and after cutting off a pair or two of leaves, if necessary, and allowing the cuttings to lie for a night in a rather dry place, insert them in sharp clean sand in small well drained pots or in pans, as may be most convenient, and plunge in a dry bottom heat, covering with a hand-glass. Guard against condensed moisture by removing and wiping the glass dry as often as may be necessary, and give a little air occasionally. Water only when this is unavoidable, and leave the glass off afterwards to allow the superfluous moisture to escape. As soon as the cuttings are fairly rooted begin to inure them to free exposure to the atmosphere of the house, and move them near the glass to prevent weakly growth. The best situation in which to grow the plants after the weather becomes warm is a close pit or frame, which can be kept close and warm, and managed according to the wants of the plants, but they will do in a close part of the greenhouse, or in the cool end of the stove. Attend to shifting as the roots are found to require more space, but avoid large shifts, or repotting before it is wanted, for the plants will be found to do better under than over-potted. Also shade slightly on bright days, and maintain a moist atmosphere by sprinkling the floors, &c., morning and evening, and if the foliage shows no indications of damp the plants may be syringed lightly overhead every fine afternoon. All this, however, should be regulated according to the state of the plants, giving them as much warmth and moisture as they will bear without damping off or making weakly growth. The flowers must be removed as they make their appearance as long as the object is to increase the size of the plants; and when it is intended to allow them to bloom they should be gradually inured to the temperature of the ordinary flower-house, taking care not to place them in the way of currents of cold drying air, when they are removed there. Those who are anxious to produce large specimens should select some late propagated plants, and prevent their flowering the first winter, by pinching off the flowers as they make their appearance, keeping them, during the winter, in a close part of the greenhouse, or cool part of an intermediate house. They should not be placed in heat in spring, as recommended for plants intended to furnish cuttings, but should be kept in a nice equable growing temperature. The side branches must be carefully secured by means of stakes before they get so large as to endanger their being broken off, and great care must be observed with these to keep the soil in a proper state as to moisture. Plants that may not be wanted to afford cuttings after flowering, should be kept rather cool and dry for a time after blooming, and the flowers should be picked off immediately any indications of exhaustion are perceived; for unless this is attended to, they will flower themselves to death. After allowing them a month or so to recruit their energies, examine the state of the roots, and reduce the ball or shift into larger pots, as may be proper. A mixture of about equal parts good fibry peat, loam, leaf-soil, thoroughly decayed cow-dung, and sharp sand, will form a suitable compost. In potting, make the fresh soil rather firm about the ball, and secure perfect drainage by a liberal use of potsherds, and thoroughly intermixing the sand with the soil. *S.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The temperature here must now be regulated according to the requirements of the plants with which the house is furnished, but fire-heat should be used very sparingly until severe weather sets in, more with the view of drying than warming the atmosphere. Where many plants from the stove, however, are introduced, a little artificial warmth will be occasionally necessary to prolong their beauty; but the temperature need not exceed 45°, which, with husbanding the solar influences on bright days, will be sufficient for most things. In damp weather it will be necessary to use slight fires at night, giving just sufficient air to prevent damp. Thin and cut in the twiners on the roof, so as to admit every possible ray of light to the plants. The most forward Camellias, if not already in flower, should be placed in a rather close house, to induce them to open, giving them clear strong manure water; these are the most esteemed of all our winter-flowering plants, and should be plentifully in bloom now and until the house is gay with Azaleas and New Holland plants, and we have nothing that better repays the trouble necessary to grow them properly, for they are very easily managed plants. Tree Mignonette and Violets are general favourites for winter flowering, and should be carefully attended to. But Roses, if properly selected and managed, surpass everything in the way of sweet-scented plants for flowering at this season, for they combine beauty with fragrance, and require but little attention, and hardly any accommodation, to prepare them; for many of the autumn blooming kinds, if grown rather hard in pots in a sheltered corner out of doors, and prevented from flowering in the early part of the season, will now be finely covered with buds, and will bloom profusely for weeks in an airy house.

FORCING DEPARTMENT.

Pineries.—Plants swelling their fruit must be assisted with a brisk temperature, say 65° or 70° at night and 75° by day, by means of fire-heat; keeping the house rather close on sunny days and allowing the thermometer to range from 80° to 90° before giving air freely, for there is no possibility of getting Pines to swell in a low temperature. Endeavour to proportion the moisture to the temperature, for a high dry temperature is nearly as prejudicial to the swelling of the fruit as a low damp one. Also aim at maintaining a steady bottom-heat of about 85°, and at keeping the soil in a proper state as to moisture, giving clear manure water in sufficient quantities to moisten the whole of the soil as often as may be necessary. But use the syringe after this season merely to dew the plants over when the atmosphere feels uncomfortably dry, for a too free use of this and surface waterings render it difficult to judge of the state of the under soil, where the principal roots should be, and in the case of plants growing in pots this is often allowed to get into an unhealthy state, in consequence of keeping the surface excessively moist. Any young stock which may require repotting should be seen to at once, in order to allow of getting them rooted into the fresh soil before winter.

FLOWER GARDEN AND SHRUBBERIES.

Unless where alterations are in hand, the principal work in this department for the present will be mowing and clearing up leaves, &c., and if neatness is to be maintained this will require daily attention. Also thoroughly clean walks of weeds and moss, &c., and roll them frequently, to keep the surface hard and smooth. Some of the beds will now be getting shabby in even the most favoured localities, and if they are to be planted with spring-flowering things, they should be cleared and replanted at once, so as to give the plants a chance of getting established before winter. Continue to afford young stock in pits and frames the most careful attention, remembering that well prepared stock is easily carried over the winter compared with plants run up in heat late in autumn; therefore keep all established stock cool and airy. Cuttings recently potted off should be placed on a gentle bottom-heat, to encourage the formation of roots, but do not keep them close and moist, unless they can be kept in properly heated pits; otherwise, if damp cloudy weather sets in they will be excessively liable to damp off. Cuttings of Calceolarias may still be put in where the stock is deficient. These will root either in a cold frame or in a gentle bottom-heat, but cuttings grown in the open ground are very liable to damp off if put into heat. Secure as many cuttings as possible of scarce plants while there is a fair chance of rooting them, and also be prepared for taking up Scarlet Geraniums, Calceolarias, &c, where frost occurs. If a mild bottom-heat could be afforded on which to place these for a fortnight or so after potting, before storing them away for the winter, this would greatly assist in promoting the formation of fresh roots, and render the plants less liable to die back, &c., in winter.

HARDY FRUIT and KITCHEN GARDEN.

Look over the fruit remaining out of doors frequently, and gather any that may be liable to be blown down and bruised, for we may expect high winds and rough weather; also examine that stored in the house as often as convenient, as there will frequently be a few decaying fruit found for a few weeks after housing, and these, if not removed, impart the mischief to others. Any trees that require root-pruning or removing should be seen to as soon as possible after the crop is gathered; and where young trees are to be planted this season, preparations for doing so should be made without any unnecessary loss of time; for planting cannot be done too soon after this season. The principal crops of Celery should now be kept earthed up rather closely, using lime and soot freely to destroy slugs, and where these are troublesome, it will be found to be a very good practice to examine the ridges every morning, and apply lime, or pick up the slugs. Dress Strawberry plantations, if not yet done, clearingaway all runners, &c.; and give the ground a good dressing of manure- but avoid deep digging or injuring the roots.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Oct. 12, 1854, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 21st, 1836—therm. 73 deg.; and the lowest on the 21st, 1842—therm. 20 deg.

Notices to Correspondents.

Books: *W G.* The "Penny Cyclopædia," now republishing under the name of the "English Encyclopædia," is, in our opinion, the best adapted to all general readers,

Cold Pits: *Sub.* Frigi domo will afford you as good protection as mats; it may cost a little more at first, but it lasts longer than mats, and, therefore, in the long run will be found more economical. Can you not contrive some cheap straw protection which would answer your purpose? ‡

Emigration: *T D.* In our own case we should recommend the young man to seek his fortune in Canada; turning himself to any kind of work for which he may be suited. In colonies a man must not be fastidious.

Guernsey Lilies: *Oxon.* Plant them in 6-inch pots in light sandy soil, and place them on the front shelf of your greenhouse. The only attention they will then require will be watering, and tying their flower stems, as they grow, to neat supports. When they have done flowering, give them a shift, and still continue to treat them well until the foliage has died down, when the bulbs may be taken up and stored away in some dry place till the following September, when they should be repotted, and encouraged to grow again. Managed in this way they sometimes bloom equally well the second year as the first. For further particulars see our volume for 1852. p. 742. ‡

Insects: *H M.* Your Pine trees are attacked by the common Hylurgus piniperda. It is the perfect beetle which injures the young shoots; and the only remedy adopted in the great German Pine forests is to pick off and burn the young shoots as soon as they appear infested. As the eggs are laid under the bark of sickly and felled Pine trees, as well as on the Silver and Spruce Firs, it is necessary to look out for and destroy them in this state by barking the trees, as the grubs reside within the bark. *W.*

Names of Fruits: *W T S.* 1, Louise Bonne (of Jersey); 8, 84, Autumn Bergamot; 15, Seckel; 19, 37, Beurré Diel; 23, Winter Nelis; 26, Vicar of Winkfield; 28, 38, Beurré Bosc; 34, Flemish Beauty; 39, Easter Beurré; 44, Ne plus Meuris; 47, Bon Chrétien Fondant; 51, Winter Bon Chrétien; 53, King Edward's; 61, Duchesse d'Angoulême; 67, Beurré de Capiaumont; 71, Uvedale's St. Germain; 75, Figue de Naples.—*Ann Hughes.* 1, Beurré Diel; 2, March Bergamot.—*Alsned.* 1, London Pippin; 2, Hughes's Golden Pippin.‡

Name of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*A Young Gardener.* Some Eupatorium, but we do not recollect the species.—*J C C.* We are sorry to say it is indeed the terrible Anacharis alsinastrum, the appearance of which we long ago announced.—*A Z.* 2. Chelone glabra; 1, Aralia pubescens, we believe, but we should like to see a much better specimen, pressed flat and not shrivelled.—*Devonian.* Boussingaultia baselloides. The White Iris you mention never reached us.—*H H, Cork.* Anacharis alsinastrum, the newly arrived enemy to canals.—*Constant Reader.* It is the Osage Orange.—*A Z.* Next week.—*T H F.* Clavaria grisea.—*S M.* Erysimum cheiranthoides.

Span-roofed House: *Ignoramus.* Two rows of 4-inch pipes are sufficient. Build a narrow hollow chamber next the walls, in which earth may be put for your climbers to grow in; the chamber need not be more than a foot wide. Carry a shelf all round the chamber, and have a stage in the middle of the house.

The Osage Orange: *A Sub.* As soon as your seedlings have lost their leaves, plant them out in rows 2 feet apart, and 1 foot asunder in the rows.

Wall Plant: *Woglog.* We should think Eugenia Ugni would do perfectly well, provided you do not require to cover more space than would be occupied by a common Myrtle.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6*l.* per ton, free to Railway.
They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.
Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

ARTIFICIAL GUANO & GENERAL MANURE COMPANY.
THIS Company (as its name implies) has been formed for the purpose of providing at scarcely more than half its price, a Manure equal in fertilising power to, and possessing all the beneficial properties of Peruvian Guano. The directors are now prepared to receive orders for their Wheat Manure (to be used in the same proportions as best Guano); price 7*l.* 7*s.* per ton, or 8*s.* per cwt. Manures for other crops are in course of preparation, and when ready, will be duly advertised.
The directors beg to state that as their Manures are sold at the lowest possible remunerating price, a remittance must accompany the order; and they furthermore request that they may be made acquainted with the nature of the soil for which the Manure is required. A correct analysis, if required, will be forwarded on application.
Address to the Manager of the Artificial Guano Company, 3, Gloucester Terrace, Gloucester Road, Upper Grange Road, Bermondsey.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.
It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

Extracts from numerous Testimonials in favour of JACKSON'S PREPARATION.

"Belmont Farm, Eltham, Kent, August 28th, 1854.
"Sir,—I am now about to perform my promise, to let you know how your prepared Potatoes have turned out here. As a practical farmer of some experience I had despaired of finding any remedy for the disease; but I must confess that a stronger proof of the efficacy of your process in Preserving Potatoes, could not have presented itself than I have now to relate. One of the fields of this farm, the property of Mrs. Stanbury, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the smut. Any person may see the difference of the prepared and unprepared Potatoes at a glance. You are at liberty to make any use you please of this letter, and I remain, Sir, your obedient Servant,
"G. B. BAXTER.
"To Mr. Jackson, "Late of Ruxley Farm, Kent.
"18, Cannon Street, London Bridge."

LAND DRAINAGE.
MR. JOHNSON begs to inform Landowners, Agents, &c., that he is prepared to undertake the Drainage of any description of Land, either by contract, or by a small charge per acre for planning and setting out the drains, taking levels, and superintending the work. Numerous satisfactory references can be given by Mr. J., who has been for several years in constant practice as a Draining Engineer.—Address 12, Abingdon Street, Westminster.

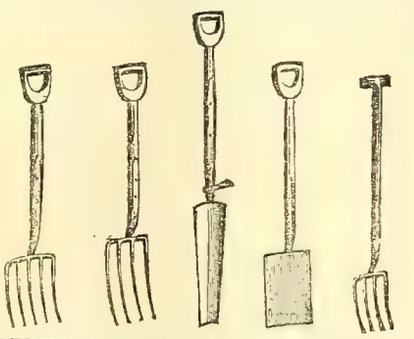
WIRE FENCING, 6¾*d.* per square yard, in various widths, from 6 feet to 15 inches, mesh less than 2 inches. An effectual fence against Hares, Rabbits, Sheep, Deer, &c., and for the enclosure of Poultry, Pheasants, &c. 4-inch mesh, 4*d.* per square yard.
R. RICHARDSON, 21, Tonbridge Place, New Road, London.

SAMUELSON'S PATENT PRIZE FORKING MACHINE (Silver Medal from the Royal Agricultural Society of England, Prize from the Yorkshire Agricultural Society, Prize from the Cleveland Agricultural Society, and Prize from the Worcestershire Agricultural Society) is now proved by experience to be an invaluable implement for deep tillage, and equally effective as an extractor of Couch Grass and other Weeds, in testimonial of which, numerous reports from farmers using it in every part of the kingdom may be had on application. Various imitations have failed, through the absence of its essential feature—the Patent Fork. The amount of horse power is less in proportion to the surface deeply pulverised than that required in the ordinary shallow ploughing. The application of steam power to tillage is still a problem to be solved, and it is not necessary to defer deep cultivation until its solution be accomplished.

SAMUELSON'S IMPROVED GARDNERS' TURNIP CUTTER (Prize for the ninth time, at the Royal Agricultural Society's Meeting, Lincoln, 1854). The improvement is a rasping plate for loosening and voiding dirt from the roots, whilst being cut, whereby the scouring tendency of root feeding is diminished.
B. SAMUELSON (Successor to the late Mr. Gardner), Britannia Works, Banbury.

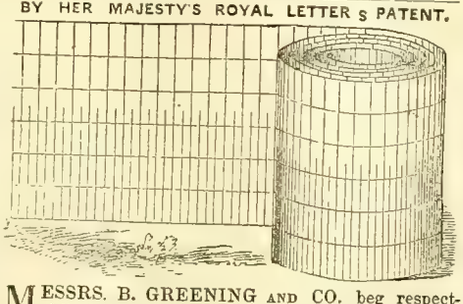
"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



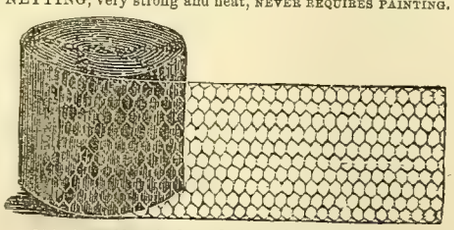
MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.



MESSRS. B. GREENING AND CO. beg respectfully to call attention to their superior WIRE FENCES, of which the following are the principal varieties:—Portable Horse and Cattle Fencing (Economical variety of ditto), Portable Sheep and Lamb, Proof Fencing, Poultry Fence, Portable Hare and Rabbit-proof Fencing, Ornamental Garden Fences, Export varieties, Poultry and Chicken-proof Fencing. Light and cheap kinds of most of the above. Trainers for Peas, &c., Garden Bordering, Tree Protectors, Hen Houses, Poultry and other Aviaries, &c.
Messrs. B. G. & Co. being the sole patentees for the machinery for manufacturing these Fences, will forward engraved sheets of Patterns, Prize Lists, Prospectuses, &c., gratis, on application to their establishments, 1 and 3, Church Gates, or 2 and 2 A, Cateaton Street, Manchester.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

		Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide	...	7*d.* per yd.	5*d.* per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "
1⅝-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.
Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

TO NOBLEMEN, STEWARDS, AND OTHERS.
J. WRIGHT, 36, Boar Lane, Leeds, begs to call the attention of parties about to improve their Farm Estates to his O.G. Rain Water Spouting, which, for lightness, durability, and cheapness, cannot be equalled. 4 inch, at 1*s.* 1*d.* per yard; 4½ inch, 1*s.* 2½*d.* per yard; 5 inch, 1*s.* 5*d.* per yard.
Wire Working, Sheep Fencing and Hurdles, at reasonable prices. Garden Implements of every description.
N.B. To be Sold, a bargain, a Large Wire Aviary.

HOSE PIPING.—GREAT REDUCTION IN PRICE.
PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.
BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

HIGHLAND AND AGRICULTURAL SOCIETY.
EDINBURGH VETERINARY COLLEGE.—The Committee of the HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, appointed to superintend the VETERINARY COLLEGE, hereby intimate that the Session will commence, within the new Class Room, upon TUESDAY, the 7th of November.
The Course of Study will be conducted as follows:—
1. Zoiatrics, Veterinary Medicine and Surgery. Professor Dick.
2. The Principles of Chemistry and Pharmacy. Dr. George Wilson, F.R.S.E.
3. General Zootomy and Demonstrations. Mr. Barlow, V.S.
4. Zootherapeutics and Dietetics. Mr. Dun, V.S.
5. General Practice. Mr. Worthington, V.S.
The pupils have the advantage of seeing an extensive practice amongst all the domesticated animals, and may be examined for their Degree after studying for two sessions. The Diploma qualifies for appointments both in her Majesty's and the Hon. East India Company's Service. Perpetual Tickets for all the Classes, 16*l.* 16*s.*
By order of the Committee,
JN. HALL MAXWELL, Secretary.
Highland and Agricultural Society, Edinburgh, Oct. 14.

SUSSEX, KENT, AND SURREY POULTRY EXHIBITION.—The ANNUAL SHOW of the REIGATE POULTRY SOCIETY, open to the above three Counties, will be held at the PAVILION, BRIGHTON, on the 21st, 22d, and 23d of November.—For particulars apply to Mr. JAMES FISHER, Reigate, Mr. GEORGE K. KING, 155, North Street, Brighton, E. N. HARPER, Esq., Reigate, and CHARLES HART, Esq., Dorking, Honorary Secretaries.

SOUTH DURHAM AND NORTH RIDING OF YORKSHIRE FAT STOCK & POULTRY SOCIETY.—The SECOND ANNUAL EXHIBITION of this Society will be held at DARLINGTON, in the County of Durham, on THURSDAY and FRIDAY, December 7 and 8, Prize Lists of which are now ready, and can be had on application to the Secretary. JOHN HODGSON, Hon. Sec.
Darlington, September 30.

THE BIRMINGHAM POULTRY SHOW, 1854.
The SIXTH GREAT ANNUAL EXHIBITION OF DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of December next. Copies of the Prize Lists and Certificates of entry may be had on application to the Secretary.
In addition to the prizes announced in the list dated the 23d of February last, the General Purposes Committee of the Council have resolved to offer First Prizes of 2*l.*, and Second Prizes of 1*l.*, for Single Cock Birds of any age, of all the following varieties, viz.: Dorking, Spanish, Cochin China, Bramah Pootra, Pencilled Hamburgh, Spangled Hamburgh, Game, and Polish; and that the same shall be entered under Letters A to H on the ordinary certificates, and exhibited separately.
Seven Silver Vases, of the value of six guineas each, will also be awarded, instead of money prizes, for the best pen of Pencilled Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, and Game Fowls.
First, Second, and Third Prizes of 3*l.*, 2*l.*, and 1*l.* respectively, are offered in all the Classes for Fowls, as well as for Turkeys, Ducks, and Geese. Liberal Prizes will also be awarded to good specimens shown by Cottagers, whose entries must be made on a form of certificate different from that used for the general classes.
The ENTRIES CLOSE on SATURDAY, the 11th of November.
JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham, Oct. 7, 1854.

SMITHFIELD CLUB, 1854.
CHRISTMAS FAT CATTLE SHOW.—The Annual Show of Fat Cattle, Sheep, and Pigs, will take place on the 5th, 6th, 7th, and 8th of December, 1854, at the Carriage Bazaar, King Street, Portman Square, London.
All Certificates must be returned to the Honorary Secretary on or before SATURDAY, the 4th November, 1854.
Prize Sheets, and the necessary Printed Forms of Certificates, are now ready, and can be obtained on application to
B. T. BRANDRETH GIBBS, Hon. Sec.
Corner of Half-Moon Street, Piccadilly, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 14, 1854.

MEETINGS FOR THE ENSUING WEEK.
THURSDAY, October 19—Agricultural Imp. Society of Ireland.

WE have received the following letter from Mr PAINE, of Farnham, on the subject of our last week's remarks. The FINGER and TOE DISEASE is at any time so curious and mysterious a malady, and this year one of such serious importance, and Mr. PAINE's statement of his experience is so explicit and satisfactory a contribution to the natural history of it, that we are glad to give it this prominent place in our columns:—

"Your leading article of last week induces me to send you a few lines detailing a fact illustrative of the 'Anbury' disease, as well as of its cure. I fully concur with you in considering the Finger and Toe development in the Turnip plant to be a *disease* which I attribute *entirely* to the condition of the soil; arising, probably, from its deficiency in certain inorganic particles, or from the improper chemical combination of those particles, which may be readjusted by agents within our own control. I have on two or three occasions stated this opinion at the Council Meetings of the Royal Agricultural Society, where I have described those remedial measures, which in my own practice I have hitherto invariably found effectual in the removal of this disease. That remedy is *lime*—probably lime of a peculiar

character. That which I use is *grey* lime, and it contains 'soluble silica.'

"I now happen to have before my eyes a capital exemplification, both of the unusual intensity of the disorder and of its cure, in two large fields of Swedes adjoining each other: one of them belonging to myself, the other to a neighbour and friend of mine. These fields are geologically situated upon the lower greensand, the surface soil being gravelly. The ordinary mode of cultivation is the four-field course. Four years ago these two fields were also in Swedes, when both utterly failed from the ravages of this disease. On my field last spring I put 160 bushels of this grey lime per acre; while my friend applied *none* to his field, but in all other respects it was well manured and well cultivated. There was a good plant alike in both fields, and the Swedes grew equally well until after the first hoeing, when the disease commenced its ravages on my friend's field, and continued its devastation until, in many parts of the field, for half an acre together, *scarcely a single plant is left alive*. Those worst spots were re-sown with white Turnips, and the seed hoed in, and now I perceive that the young Turnips also are all beginning to be infected. In a word, the crop of this field is again utterly destroyed.

"On the other hand, in my own field, although the disease is not completely extirpated, I do not think there is more than one Swede in ten, on the average, at all affected, while there is a prospect of growing nearly, or quite, 25 tons per acre.

"I may here state that in my general farming practice, whenever I see the slightest tendency to the development of Finger and Toe in my Turnips, I take this as an indication that the land requires lime, which I then apply, not only for their removal, but in the full expectation that it will be beneficial to my other crops; and I think that their usual excellence testifies to the soundness of the practice.

"As the above illustration of this destructive disease and its effectual cure are so palpable that it is manifest more than a mile from the spot, and as the disorder is so prevalent in many districts, I thought it a public duty to communicate the fact through your columns, that others may obtain a similar benefit. For the ensuing Turnip crop I would, in all cases, recommend the lime to be applied as early as possible, in order that it may become well commingled with the soil before the Turnips are sown.

"I am, of course, well aware that the application of lime, with the view of obviating the 'anbury' disease, is no novelty; but as I have often heard its remedial effects controverted, I think it extremely probable that this *difference* of opinion may be justified by facts, and these facts may be dependent upon the QUALITY of the lime employed; at any rate this branch of the subject is well worthy of further investigation."

A PRINTED sheet which is now lying before us is a most useful sequel to the allotment competition at Tortworth last month, to which we made reference at page 633. The various exhibitors, allotment holders and farm tenants, on Earl DUCIE's estate are thus informed of the results of the competition which occurred; and the honour of success is, of course, increased by publication.

That our readers may learn the extent an exhibition, which on a single estate, extending over five parishes, may at its very starting assume, we publish the table showing the number of articles exhibited, with the districts from which they were sent:—

* It will be understood that the "number" of Potatoes, Parsnips, &c., means the number of *lots* under each head—enough was exhibited of each to cover a space of some 15 inches square upon the table. The number and quality of lots thus congregated were a most valuable testimony to the skill and energy with which allotment cultivation is carried on in this neighbourhood; as well as to the respect and goodwill which have been called forth by this effort of the landlord to unite his tenantry with himself in a matter involving so much social as well as agricultural importance. It will be of general service, if the publication of this remarkable success of a first effort of the kind shall induce its imitation on other estates in other parts of the country.

WE have received the following letter from Mr. CAIRD, just as we are going to press; and it is but justice to that gentleman, who has, in our opinion, been unjustly attacked, to give it all the prominence in our power:—

"Somehow or other, though the political question is at an end, there are certain persons connected with the agricultural interest who seem resolved to make me stand ill with the English farmers. I have, however, such confidence in the English love of fair play, that I make an appeal to their sense of justice.

"I am charged in the most offensive terms with having knowingly made an untrue statement at Tiptree, in regard to Mr. TELFER's Italian Rye-grass. To those who know me, I trust it is unnecessary to offer an answer to such a charge. To the agricultural body at large it is right that I should offer an explanation.

"I was called upon quite unexpectedly to acknowledge the toast of 'British and Foreign Agriculture.' I had neither time nor opportunity for premeditation, and in running rapidly through my mind the topics most likely to interest the distinguished audience of political and scientific men, as well as agriculturists, whom Mr. MECHI had assembled around him, it seemed to me right to point out the natural distinction which the difference of climate in the east and west sides of Great Britain had produced in our agriculture. As an illustration of the effects of liquid manure in a favourable climate, I repeated a statement which very much corroborated one previously made by Mr. MECHI, to this effect, that a gentleman then present, Mr. TELFER, had told me that day that he had grown 25 tons of Italian Rye-grass hay on a Scotch acre (or 20 tons an English acre) in three cuttings. I appealed to Mr. TELFER, who was sitting near me, whether I had not rightly so understood him. This appeal was made in the hearing of the 300 gentlemen who were present; and no dissent being intimated from Mr. TELFER, I passed on to another subject.

"I am not a reader of the *Mark Lane Express*, but the two last numbers have been sent to me. The Editor and his correspondents seem disposed to fasten upon me as the originator of the statement of this extraordinary crop of hay. It is necessary, therefore, that I should make my own position in the matter perfectly clear.

"In walking through Mr. MECHI's farm previous to the dinner, Mr. TELFER said to Mr. MORTON and me, when we were speaking of the large number of live stock which Mr. KENNEDY, of Myremill, maintained on his Italian Rye-grass, that he himself had grown 25 tons of hay in three cuttings from a Scotch acre of this Grass. We both were surprised, and disposed to question the statement; but on further conversation we were astonished to find that Mr. TELFER's hay crop and Mr. KENNEDY's live stock remarkably corroborated and confirmed each other. I had several times visited the farms of both these gentlemen, and knew them to be accounted men of character and veracity. I felt myself justified therefore in repeating this statement, and if I had in any way misunderstood Mr. TELFER, I gave him a public opportunity of setting me right. I distinctly affirm, therefore, that the statement publicly made by me at Mr. MECHI's was an exact repetition of the statement made to Mr. MORTON and myself by Mr. TELFER. So much for the matter of fact in regard to me.

"But suppose, instead of saying 20 tons of hay per acre, I had said its equivalent—65 tons of Grass. The illustration would have been exactly the same; and Mr. TELFER, whether he converts it into hay or not, equally draws from the land many times its ordinary produce by the aid of liquid manure and moist climate together.

"The tone and terms which the editor of the *Mark Lane Express* uses towards me, and admits from his correspondents, are discreditable to the character of a respectable journal. I throw back his insinuation with disdain and contempt. I submitted to attacks the most false and libellous when directed against me for political objects, but I do not promise the same forbearance now. If the editor and his friends who were present at Mr. MECHI's really felt so indignant, why did they not speak out like men at the time?

"Oct. 11." "JAMES CAIRD, Baldon."

THE AYRSHIRE HAY CROP.

"I TOOK your paper to read in the train to Holyhead, and I am much hurt to see you adopt the wild statements of Mr. Caird. I had always looked up to you as an agricultural authority. I now cease to have any confidence in you. I should have stopped Mr. Caird in his impossible statements had it not been for the respect I have for our friend Mechi, not wishing to have an unpleasant discussion at his hospitable board. Afterwards I expressed indignation at such mis-statements being made, when a Scotchman defended Mr. Caird (I suppose Mr. Telfer), and said it was perfectly true 25 tons had been made and dried at three cuttings; when I showed that if such crops were grown they could never be dried in that climate. He said the hay-making machine was frequently moving it. I then exclaimed—'*This settles the matter, for no hay-making machine ever invented would move half such a crop.*' Now, sir, I should have liked you better if you had mentioned my name when you attacked me. I am prepared to stake my agricultural reputation of many years' standing as to the impossibility of Mr. Caird's assertions, and to appeal to the practical agricultural world whether it would be possible, three times before the end of July, to dry such crops if they were ever grown. I consider such statements as most wicked, and your adopting them as most damaging to an agricultural leader. *T. Beale Browne, of Hampen, Gloucestershire.*" [We take the above from the columns of the *Mark Lane Express* of last Monday, in which it appears as a letter addressed to ourselves, and preceded by the following note to the editor of the *Express*:—

SIR—I am unjustly attacked in the *Gardeners' Chronicle*, and I enclose you a copy of the letter I have sent them. In future, I shall order your paper instead of theirs. Will you kindly insert the letter in your paper, as a copy of the letter I sent to the editor of the *Gardeners' Chronicle*? I am, sir, yours, &c.

Dublin, Oct. 7. T. BEALE BROWNE.

The letter thus "sent to the editor of the *Gardeners' Chronicle*" has not reached us;* but as we are sorry to have lost the good opinion of one who is so well known in the agricultural world as Mr. Beale Browne, we take it from the columns of our contemporary, for the purpose of offering such explanatory remarks as may, perhaps, tend to our justification in his eyes. And as the *Mark Lane Express* is to be the only paper he is to read for the future, we venture to ask that this paragraph may be reprinted there, in order that it may meet his eye. (1) The *unjust attack* upon Mr. Browne in our columns we presume to consist in our assertion that his incredulity was expressed in an extravagant manner;† and that is an opinion in which we think most people will coincide. It is the only statement of opinion made in which he is *personally* interested. (2) We should have preferred with himself to have named him personally in connection with this statement, but we could not at the time recall to mind either his full name or his address, without which he would not have been identified. (3) As to the agricultural bearing of our remarks—the only really important aspect of the matter—which after all we presume to be the ground of Mr. Browne's displeasure—after reading what we said, it really does not appear necessary to alter it at all. It is, however, possible that the wording of the statement may have failed properly to convey our meaning, which related to two separate points:—First, the real origin and authority for the statement, both as regards the Grass crop and the crop of hay; and secondly, the credibility of the statement regarding the amount of Grass obtained at a single cutting—for that is the *only* part of the statement on which we have hitherto expressed our own opinion. As regards the first, the facts of the case make Mr. Caird to have been merely the voice by which *Mr. Telfer* uttered what was said, for the statement made was obtained in conversation from himself, and he sat close by the speaker all the time. And here we venture to add to what we previously said, that we perfectly remember asking Mr. Telfer, whether his statement, meaning of course that about the hay as well as that about the Grass, was not the result of estimate and calculation founded on the mere portion of a field; and the answer was that it was really an experience *per acre*. Mr. Telfer, we see, has this week said that the remark about the hay referred to the quantity which could *probably* be made out of the Grass which was *actually* cut; and we agree in the opinion on this point which he has expressed: nevertheless, we must abide by the testimony we have already given as to the remark that *was* made upon the ground, and as to the person on whom the responsibility of it really rests. On the second point, the credibility of the statement that 25 tons of Grass have been taken at a cutting from a Scotch acre, we do not think it is either "wicked" to say so, or "damaging" to an agricultural reputation to believe it. Does Mr. Browne remember that there are two witnesses on this subject? Mr. Kennedy, of Myre Mill, on 33 Scotch acres had kept 250 "large cattle," 465 sheep, 200 pigs, and 25 cart horses, "during the past month." Will any one tell us the produce per acre here? We imagine it will be found to bear out pretty fully Mr. Telfer's statement.]

One word of explanation to our friends of the *Mark Lane Express*. Their further quotations from the article which has occupied their own attention and that of their readers to so flattering a degree are *verbally* exact, which the first one was not. For our "indignant and curious denial" on this point, however, to which they refer, we fear our readers will have searched in vain, though *their* readers will, no doubt, believe us to have indeed been "splitting straws" in a very remarkable temper. Their reference to "travellers' tales," in connection with the name of the late Captain Basil Hall, one of whose adventures we related, is unfortunate. The travellers' tales of Captain Basil Hall were exact and truthful contributions to geography, natural history, and all the other sciences in which a sailor is professionally interested, and to that the leading men in each will readily bear witness. If we or the *Mark Lane Express* shall deserve a character for truthfulness such as Capt. Basil Hall's, we may very well be satisfied.

---

* Oct. 12.—The letter has now reached us, since the above was in the printers' hands. It has the following postscript:—"I shall expect you in common fairness to give his a place in your Paper." Mr. Browne need never doubt our desire to exhibit "common fairness."

† See foot note second column, p. 633

TWENTY TONS OF HAY PER ACRE.

It is of the highest importance to the agricultural world to ascertain whether this statement, as made by Mr. Caird at Mr. Mechi's gathering, is true or false; it is thought by some untrue, by other agriculturists of high repute, as impossible,—so much so, that the ram breeder at Tiptree is reported to have said that the man who dared to have made such a statement at his ram show would not have gone away alive.

I have waited with some anxiety, that Mr. Telfer, who was at Mr. Mechi's, should have replied, or that Mr. Kennedy, of Myre Mill (also quoted), should have done so; neither of them have, so I venture myself again before the public the advocate of my own system of growing my own plant, and state, without hesitation or fear of proof to the contrary, that it is true; that as much of my Italian Rye-grass can be grown upon a Scotch acre of good land in one year, cultivated as by Mr. Kennedy or Mr. Telfer, as will keep 70 sheep or produce 20 tons of hay; I make this statement boldly, because it is the result of 10 years' practice upon a surface and subsoil of clay.

Some persons have thought the Grass for 20 tons of hay was grown in one crop, and have been asked that question. It is not so. The Grass may be cut from seven to ten times in 12 months; during the summer months, when the temperature of the atmosphere is high, a yard of Grass in height may be grown in 21 days. In 1844, my first crop was cut early in March; the second, April 13th; the third, May 4th; the fourth, May 24th; the fifth, June 14th; the sixth, July 22d, with a crop of seed; here the liquid was used up and discontinued; three slight crops were cut afterwards, but not dated. To this the public attention was called; the fact could not be denied, but every one accounted for it by some extraordinary advantage I had, they did not possess—to the vast quantity of liquid manure I had, they had not. No one said it was the fine land; all admitted the land to be very bad. Knowing that every one could do so who really tried, I foolishly appropriated a field of 20 acres to grow the Grass to make into hay without the liquid, to convince the public that they could do so. I made the year's Grass into hay upon the field before the public; 13 stacks, containing from 12 to 15 loads each, were erected. I was silly enough to make one crop in November (which was, of course, stacked at much cost),—a heap of manure; when the weather is not hot and fine, it takes longer to make the hay than to grow the Grass, so that one is done at the expense of the other. If I had removed the Grass from the field directly it was cut, and made it elsewhere, that year's growth would have been little less than Mr. Telfer's statement. This did not convince agriculturists at large; anger was the result in many cases; but there were some who took the hint, and adopted the system of Mr. Kennedy, Mr. Telfer, Mr. Harvey, and Mr. M'Culloch, all Scotchmen, 300 to 400 miles off, while only one of my neighbours did so. Mr. M'Culloch was brought from Scotland by Colonel M'Douall to see a wonderful crop of Grass grown upon a new system, therefore he was prepared to be surprised. Being taken into a field of Grass of 14 acres, early in April, he expressed his surprise most heartily, saying it was a great sight, worth coming from the furthest part of Scotland to see; he had never seen anything in agriculture so wonderful. I asked him what he would say, then, if he were told it was the second crop this year; he said he would not believe any man that swore it. Being taken down the field to the far end, he saw a wall of Grass that convinced him at once of the fact that it was the second crop; he then said he would never disbelieve anything again.

I am now stating things in the presence of men living, to be contradicted if untrue. I grew as an experiment in my garden a patch of Grass 5 feet 10 inches high, examined and measured by a committee of the House of Commons, with whom was Mr. Shaw Lefevre. I will not say what this crop weighed, although I know, lest I should damage the other facts I have stated; but I will state them when 7 to 10 crops are grown that weigh 8 to 18 tons per acre (English) according to the skill of the cultivator; that it shrinks only in the proportion from five to two in the open air in 12 days, it may be conceived how 20 tons of hay per acre (Scotch being 1¼ English) may be grown upon one acre of land; it may also be easily tried by any one very desirous to know, by getting from me, Mr. Kennedy, or Mr. Telfer, as much seed as will answer his experimental purpose for one acre, 4 bushels being the quantity.

Many other experiments have been made too numerous to require you to insert, but one bearing particularly ought to be mentioned—it was how much land could 4 horses clear in 24 hours; running loose in a yard, without any other food, and fed to the full. They cleared 7 yards by 5½; a piece of land just under 5 acres, kept from 70 to 100 horses in rack-meat during the spring and summer months, some of them eating four feeds of Oats per day, and some no Oats at all

I have now sat down 90 miles from all my advantages, upon the poor land of the New Forest, to use up the remnants of my mind and body in agricultural pursuits. I shall make many blunders, but shall relinquish and correct them when I find them,—shall, with the Divine blessing, endeavour to show that my Italian Rye-grass can be grown as successfully upon the light land here, as it was upon the stiff clay of the London basin. It will be a great pleasure to me to find, while a pilgrim in this world, that my plant is grown, and my system adopted over the whole of my country with satisfaction and profit. In order to assist it, I shall publish a pamphlet of instruction with as little delay as possible, with instructions to carry it out at the cost of as few pence as possible, and place it in the hands of a vendor, the profit of which, if any, will be applied to the soldiers' and sailors' orphan fund. *William Dickinson, New Park, Lymington, Hants, Oct.* 12, 1854.

MICHAELMAS RENTS ON CORN AVERAGES.

The adoption of corn rents based on the average prices of Wheat, or of Wheat, Barley, and Oats, for the farmer's year, ending on Michaelmas day, having been strongly advocated by many gentlemen as forming a more equitable bargain between the landlord and tenant, I was induced to make a communication to you in October, 1853, and as a continuation embracing the year ending Michaelmas day 1854, I have prepared the annexed statement. I also subjoin the weekly averages upon which the quarterly and annual average is founded, put into a shape more convenient for reference than the return published in the *London Gazette*.

It would tend very much to promote the extension of the system if a general plan of proceeding could be introduced; and with a view to this object it would be gratifying to me to be furnished with information as to the mode in which the adoption of corn rents has been introduced and carried out in different parts of England, particularly with reference to the basis prices of grain.

By way of example, we will suppose that a farm would be worth 300*l.* a year rent, if the average prices were as follows, viz.:

Wheat...	7*s.* 0½*d.*	per Imp. bush.,	or	56*s.* 2*d.* per Imp. qr.
Barley...	3 11½	„ „	or	31 8 „
Oats ...	2 9	„ „	or	23 0 „

Now, at these prices, if we turn one-third of the rent into each of the above kinds of grain, the corn rent will be—284·866 bushels of Wheat; 505·263 Barley, and 727·272 Oats.

And these quantities valued into money at the annual average prices ascertained up to each Michaelmas day will give the rent from year to year during the continuance of the agreement.

Charles M. Willich, Actuary University Life Office, 25, Suffolk Street, Pall Mall, 6th Oct. 1854.

Home Correspondence.

Anbury.—I have read in your columns for several weeks past, articles on the disease in Turnips, called finger and toe, or anbury. Some years ago, my father took a farm which was completely run out by bad farming; the first crop of Turnips he grew were all diseased with anbury, also the tops very much diseased; he said the soil was sour, and wanted marling, which was done. The result was, he had no more finger and toe, or anbury. I consider the coarse roots shown by your drawings are from seed raised from a badly selected root, but the anbury is a decided disease or swelling of the roots. *John W. Drake, Chignal, near Chelmsford.*

Dartmoor Farming.—[We have received from a friend the following letter by Mr. Fowler, written without the idea of publication, which, however, has been since permitted.] :—I had hoped to have seen you at my sale, but concluded you could not conveniently arrange to do so. Considering the depression then setting in on cattle and sheep, the prices obtained were good—probably near 100*l.* more than now would be made; 40*s.* to 81*s.* my store ewes, 23*s.* 6*d.* average of ewe lambs, 22*s.* 3*d.* average of wether ditto, 14*l.* Cotswold ram, which I bought at seven guineas and used two seasons; bullocks, all ages and all prices, from 4*l.* to 17*l.*; it was only four store Cotswold ewes that made 81*s.* each; my own bred ewes made 40*s.* to 43*s.*, and some of these were getting old—part Cotswold and part Cheviot. I should like to know what my Scotch correspondent in the *Gardeners' Chronicle*, Major M'Inroy, has now to say of this cross. I only reserved about 50 breeding ewes from the sale, but so unbounded has been the growth of my pastures since the auction, I have just bought 62 more breeding ewes, taken in 60 sheep to keep, and agreed with persons who have just inspected the keep to take 230 more; 24 bullocks also are now with me, and I am ready to find plenty of keep for 30 or 40 more. Poor old despised Dartmoor does now rather astonish the natives here. To-day my next neighbour has been over my grounds, and remarked that he had no idea that there were such pastures here. Seventy ewes he sends to-morrow for three weeks, at 5*s.* per score per week. My 10 acres of Rape have grown most rapidly of late, and by next April I quite hope the ewes and lambs will feel themselves most comfortable when penned upon it. Aug. 30 to Sept. 18 were the dates of the Rape sowing. This crop will be watched with much interest, as it is quite a new move here, and my neighbours know not what to think of it; but if I am not much mistaken, by next spring some light will dawn upon them as to the value of this crop, which will come to our aid in the most trying month in the whole year, viz., April; then in May or June down with the land, at a small amount of labour, to roots. My 20 acres of Grass seeds with one pint of Rape per acre, seeded August 3, 19, 21, are making great progress; the crop looks just like the end of May. Fortunately, I may say, for you, this long personal detail must end, as space now vanishes and I almost fear I shall have wearied you; but knowing the deep interest you take in these matters, I mean to post this dry document. *Geo. W. Fowler.*

Liquid Manure.—Surely a man must be mad to talk in this civilised age, of anyone endangering his life by any statement he can make, however extravagant. Let anyone who doubts the truth of Mr. Caird's assertion made at Mr. Mechi's late gathering, and authorised by Mr. Telfer, try the following simple experiment. Take a cubic foot of dung from the middle of a manure heap, that has been drawn out into the field for the future Wheat crop (any other may do, but the richer the heap the better). Wash it with water until it will not discolour the water it is washed in, and then dig it well into a square piece of ground in the field or garden, as may be most convenient, and sow a crop of any kind upon it. Take a second cubic foot of dung from the same heap, and as near the same place that the former was taken from as possible, and without washing dig it into a piece of ground the same size as the former, and, of course, the same quality. Then sow a crop of the same kind as the former, and afterwards wait for both crops to arrive at perfection; whenever this condition of the two crops is obtained, the difference between them will, I think, settle all dispute about liquid manure. *J. R. Markby, Duxford Rectory, Cambridgeshire.*

Seed Growers' Society.—At a meeting of the Seed Growers' Society, a few days since, attention was drawn to a letter which appeared in your columns some time since, in connection with an extract from the *Chelmsford Chronicle*, and the rules of this society. It was considered that letter was in opposition to the understanding upon which the society was established, and was not under the sanction of the committee nor written by the secretary, although his signature "A Friend of Freedom and Progress" was borrowed from the first article which appeared in your columns, that being also an extract from the Chelmsford papers. The intention of the members is not to set up a rival to the London merchants, but to secure a fair remunerative price for articles supplied them by the growers, by means of a deputation of members of the society, to meet with the members of the London trade, in order to secure a fair adjustment of prices. The chief object is to obtain the most correct information as to the supply likely to come into the market, in order to determine what is its relative value, at the same time leaving each member at perfect liberty to act for himself. The paragraph which has necessitated this explanation was under the heading "New principles.—The growers will hereafter sell to any party who pays them best for their goods, making it an open market for town and country." In other respects that letter fairly set forth the past position and present intentions of the society. *John Moss, jun., Secretary, Feering, near Kelvedon, Essex, October* 5.

Weeds: Couch Grass.—On reading a book on the "Weeds of Agriculture," in 1830, I have made this memorandum. Although the true secret of destroying weeds has been known and partially practised for ages,

yet we frequently have questions asked what is the best and surest way of getting rid of this or that weed which by long neglected or improper husbandry has got full and uncontested possession of the soil. The Couch or Twitch Grasses are plants of the Agrostis family; they are the most destructive of all root weeds. If any part of them is left in the ground they grow most vigorously, and appropriate to themselves everything that is within their reach, devouring the food applied by the farmer to the ground as food for the plants he cultivates, and if they are not restrained by his utmost vigilance and the most unremitting exertions, they soon become the supreme occupiers of the soil. The White Couch (the quickens of Scotland) pushes out its strong white roots under the surface in every direction in the deep soft black land of Norfolk, Cambridge, and Lincolnshire. In this peaty soil it riots in many instances in uncontrolled possession of the whole field, particularly where the land is over-ploughed; here the White Couch sends forth its strong, creeping roots, where it meets with little or no obstruction. It increases with astonishing rapidity, and almost defies the vigilance and industry of the best farmer to master it. In the soft, light, sandy soil of Norfolk, near Holkham, I once saw a rick of the roots of this White Couch Grass, which had during the dry, warm months of May and June been taken out of a light sandy field of about 4 acres, and dried and stacked at a public-house for litter; there were from 12 to 15 tons of it. The innkeeper said that it made excellent litter, and the horses liked it, for they ate some of it. The Black Twitch, Surface Twitch, or Black Grass, is the Agrostis stolonifera; this is a most destructive weed, it abounds on the light stone-brashy soil of the oolitic formation, particularly on the Cotswold Hills, where the soil has been reduced by over-cropping. The farmer must be on his guard, for this Twitch is not only propagated by its seed and roots, but as its stems are long and trailing, every joint or stolon sends out roots like the Strawberry, and it soon becomes a most numerous family of destructive weeds, spreading themselves far and wide over the field, covering the whole surface with its thick mantle, so that it is difficult for any plant to live where this weed abounds. If the smallest and most insignificant part of this plant is allowed to remain in the most remote corner of the field, it will soon by its rapid growth extend itself into the possession of the whole field again; and it is most difficult to plough the land when it is covered with this black Grass, nor can it be done properly till it has been breast-ploughed. We cannot get rid of these weeds in any other way than by taking them out root and branch, drying them and burning them; and this is done on the Cotswold Hills by what they call "smother-burning," and thus converting the ashes of an enemy into a valuable manure for their Wheat or Turnips. But "prevention is better than cure;" therefore high farming, as it is called, will best prevent the growth of these or any other weeds. First clear the land of all weeds, and always keep it clean; apply large quantities of manure, which, with good cultivation, will produce large crops of roots; and by consuming these on the ground, and adopting the alternate system of cropping, there will be no difficulty in keeping the land free from the white or black Twitch or any other weed. About the year 1805 the value of the Agrostis stolonifera, as a rich and most productive and nutritious food for stock of all kinds, as green food during the whole of the winter months, was sounded forth by a Dr. Richardson, and it got the name of Agrostis stolonifera Richardsoniensis; and as it was very easily propagated, the doctor sent it into Ireland as the most valuable of all the Grasses, all that was required being to mow the crop at any time of the year, then carry it from the field, and cut it in lengths of about 2 inches long with a chaff-cutter, then sow the cut Grass over the field (which had been previously ploughed), and then harrow and roll it, when each of the joints or stolons took root, and a large crop soon covered the ground of what the doctor called "the most nutritious food for stock." *J. M.*

Societies.

East Cumberland.—The anniversary exhibition of implements and stock connected with this society took place on the Castle Green last month. In no department, save that of horses, were the entries numerous; nevertheless, as a whole, the exhibition was perhaps the best that has yet been held under the auspices of the society. Farmers do not now drive whole herds of cattle and flocks of sheep to the show ground; they have learnt that it is useless to attempt to defeat an opponent by dint of superior numbers. On the other hand, they are equally conscious that *fat* arguments will no longer overbalance the judgment of men who know that other and more useful qualities than mere obesity are necessary to constitute a perfect specimen of a beast. These considerations seem to have led to a most salutary result, and by general consent Saturday's cattle show was allowed to be the best of the numerous similar exhibitions of the East Cumberland Society. The show of horses has never been equalled, either for numbers or quality; Mr. Ellison, it will be observed, went so far as to say that it surpassed anything he had ever seen at the Exhibitions of the Royal Agricultural Society; and, if so, we may hope to see some of our neighbours next year successfully measuring their agricultural skill against the agglomerated excellence of all England. The Galloway cattle were beyond all praise; the short horns, in quality, were of a very superior description (though we did hear a slight contrariety of opinion amongst persons capable of judging upon this point), but in neither of these classes was there anything like the number exhibited on former occasions. The sheep, likewise, were comparatively few in number. In almost every specimen exhibited there was no lack of those good qualities which find favour in the eyes of the judges. The same remark applies to the pigs. In this department the entries were so few, and at the same time so select, that it seemed as if the prizemen of all the previous exhibitions—and they alone—had entered the lists of competition. From the remarks made at the anniversary meeting, presided over by Lord Lonsdale, we select passages from speeches by his lordship and Mr. Howard, of Corby Castle:—

In giving the toast—"The East Cumberland Agricultural Society," Lord Lonsdale said—I will congratulate you upon the marked improvement in the agriculture of this part of the county. I dare say there are some in this room as well as myself who will recollect the road between Carlisle and Penrith when it was one extensive waste—little more, in fact, than a barren heath. But now, if one travels that road, whichever way we turn, we see around us a very fair agricultural country, with here and there some first-rate specimens of good farming. All I can say is, that if the county continues to improve for the next forty years in the same ratio as it has during the past—and there is every reason to expect that the progress will be much greater, for we have now much more capital embarked, more skill, and more knowledge than could have been brought to bear on the subject in times gone by—I say, if any one of us should have the good fortune to live for so long a period, he will find at the end of that time that the improvements in every department of agriculture will be greater far than we can have any conception of at the present moment. Sometimes I have been in the habit of reading the old books upon agriculture, and I find that many of them contain fully as much information and instruction as others of more recent publication. But they had not in those days the facility we possess of diffusing such knowledge; consequently those works were but little read; to us, however, these advantages are accessible, and knowledge comes more easily to every man's door. Still I believe even at that time there were bright examples of good farming, but the great majority were what was called "slovenly." Were I to venture an opinion it would be that this county, from climate and other circumstances peculiar to it, seems particularly adapted to the growth of green crops, and I approve of the way in which that branch of cultivation has been extended, for I believe it will have been found profitable to the farmer.

Mr. P. H. Howard gave the health of the judges, and referred to the introduction of Turnip husbandry into Cumberland:—

One branch of his toast was the "Inspectors of Turnips;" and he was glad to observe that one very useful premium had been given for "Turnips grown with guano." He trusted that the gentleman who responded to this toast would be able to say whether green crops grown by that fertiliser exceeded in quantity those grown by other means of invigorating cultivation. He hoped his remark would elicit some sentiment upon that point, as it was a very important question. The cultivation of Turnips in this county was of much more recent date than was generally supposed; it did not date very far back; and a gentleman from the neighbouring county of Westmoreland had been good enough the other day to recal to the recollection of the agricultural community that it was his (Mr. Howard's) grandfather who first introduced the cultivation of Turnips into this county. His example was followed by a very excellent farmer, Mr. Collins, whose sons and descendants, he was glad to say, still inherited the paternal acres. It was difficult to estimate the value of the cultivation of that green crop upon the general social community. Through that means alone we were enabled to have a greater quantity of fresh meat during the long winter months than was formerly the case. In earlier times all the different farming bodies entered largely into the question of parrying the effects of salt meat. At present, according to their means, they were enabled to feed themselves and families on fresh provisions, and that was not a circumstance in the social scale to be neglected. It was a subject which might be very appropriately considered at the present time, and it was now more particularly necessary that attention should be paid to it, for what would be the result, with cholera raging in the land, if we were obliged to feed the population upon salt meat which was so pernicious in its qualities, and so injurious to the constitution! He would conclude, as he had begun, by proposing, and with many thanks to them for their arduous services, the health of the "Judges of Stock and Inspectors of Turnips." He was sure it was quite necessary to cheer those gentlemen in their labours. They had sometimes, perhaps, heard a disappointed competitor exclaim, in the moment of defeat, "He is wrang—he is wrang!" but he was sure those gentlemen had always exhibited not only skill and judgment in their decisions, but also the most perfect impartiality. (Loud cheers).—*Abridged from the Carlisle Patriot.*

[The Turnip was common in the dairy husbandry of Holland in the latter part of the 17th century; and we learn from the article on the subject in Wilson's "Rural Cyclopædia" (tem., 1745) that Mr. Craik, of Arbigland, in Dumfriesshire, became the earliest cultivator of drilled Turnips on the Scottish border. About 10 years later, P. H. Howard, Esq., of Corby, became the earliest cultivator of them in Cumberland; Mr. Pringle and Mr. Dawson, in Berwickshire and Roxburghshire, soon followed.]

Reviews.

Farm Implements, and the Principles of their Construction and Use; an Elementary and Familiar Treatise on Mechanics and on Natural Philosophy generally, as applied to the ordinary practices of Agriculture. With 200 Engraved Illustrations. By John J. Thomas. London: Sampson Low, Son, and Co., 47, Ludgate Hill.

This is the republication of an American work—its contents include chapters on the general principles of mechanics which are pursued to their details in the several forms of machines or simple "mechanical power"—levers, pulleys, wedges, screws, &c.; and afterwards to their uses and exemplification in farm implements. The work professes therefore to be complete on the theory and practice of agricultural mechanics. That it is more so on the former than the latter division of the subject will be plain to English readers, for whom, however, it was not originally written, and whose judgment, therefore, does not affect the merit of the author. We select a paragraph on the endless-chain powers peculiar to America, about which a correspondent made inquiry last week:—

"*Endless Chain Powers.*—A convenient and compact machine for applying animal power is by means of the endless chain, working in the position of an inclined plane, where the weight of a large dog is used for driving a churn-dasher. The platform on which the animal stands is formed of strips of light wood riveted to two India-rubber straps, and their constant downward motion turns the fly-wheel, to which a rod is attached for working the dasher. The same principle has been lately adopted with great success in the application of horse-power to driving threshing-machines, sawing wood, and to various other purposes. Instead of India-rubber straps, strong cast-iron chains are used, which are made to run smoothly and with very little friction over a succession of small iron wheels, which support the weight of the horses on the moving platform. The power of these machines, and the amount of friction in running them, may be easily ascertained by the rule, already given in a former part of this work, for determining the power of the inclined plane; for the only difference between the endless chain and a common inclined plane is, that in one the plane is fixed, and the body moves up its surface, and in the other the plane itself moves downward, and the weight or animal upon it remains stationary. The same principle applies in both cases. First, to ascertain the friction, let the platform be placed on a level, with the horse upon it; then gradually raise the end until the weight of the horse will just give it motion. This will show the precise amount of the friction; for if the end be elevated one-twentieth of its length, then the friction is one-twentieth the weight of the horse and platform. Secondly, to determine the power when the end is still further raised, measure the difference between the height thus given and the length of the platform. If, for instance, the height of the inclination is one-eighth of its length, and the horse is found to weigh 800 lbs., then the power is 100 lbs. or one-eighth the weight of the horse. This rule will not, however, apply when the draught of the horse is added to its weight; for it usually happens that the weight alone is not sufficient, without placing the platform in too steep a position for a horse to work comfortably. He is therefore attached to a whipple-tree placed on the frame of the machine, so that in drawing he pushes the platform backward with his feet. In this case, the power can be only ascertained by the use of the dynamometer, already described."

Miscellaneous.

"*God Helps Those who Help Themselves.*"—It has pleased Providence to bless this country with an abundant harvest; but that favour is not confined to England alone—it extends also to lands in which the climate and the soil are infinitely more favoured by Nature than our own. But to make a diligent use of that harvest—to extend its produce through a thousand reproductive channels of national prosperity—to enrich the agriculturist, and, through the increase of his profits, to give a fresh stimulus to trade—to make new demands on manufactures—to pour new energies into the various investments of enterprise and capital—that is the merit of the English people, and that is the way in which the civilisation of man assists the bounty of the Creator. In other countries that I might name—such, for instance, as Spain or Sicily, once the granary of Europe—lands infinitely more favourable than our own—for want of roads, for want of markets, or facilities for interchange—in one word, for want of civilisation, the corn in many places will rot uncut where it stands, and the whole harvest pass away, enriching no trade, recruiting no manufactures, rewarding no industry, affording no surplus capital to energy or enterprise; and that is the way in which uncivilised nations frustrate the benevolence of Providence. *Sir E. B. Lytton, at Hertford, Sep.* 26.

Calendar of Operations.

OCTOBER.

Wester Ross, *October* 9.—In all, save the higher districts, the crop has been brought to the stackyard in the best possible condition. Although somewhat later in commencing this year than usual, with the fine weather with which we have been favoured, the end of the harvest has been reached earlier than we could reasonably have anticipated. From wet weather we scarcely had an interruption at all, and the little we had we gladly submitted to for the Turnips' sake. For the last ten days, however, a great deal of rain has fallen, and harvest operations in the higher districts have been greatly retarded. Although the quantity thus arrested in the fields is too small to have any effect on the market, the owners thereof will abundantly feel the bad effects. A few windy days would yet set all to rights. Having now a little spare time to count our stacks and compare them with former years' returns, although scarcely finding ourselves in Punch's supposed dilemma—at a loss to know where to put such a bulky crop—it is admitted on all hands that a better crop never grew in the north. Fortunately we are unable to speak, as many in other parts of the country can, of having well nigh double the number of stacks that they had last year; as we had a good crop last year, our Oats alone being somewhat deficient. Our Oats this year are particularly good; they thresh out largely and meal abundantly. As the failure of the Potatoes in this quarter is general, there is a large demand for Oatmeal, and new Oats are now selling at 28*s.* per quarter. The stacks being secured against wind and wet, attention is now turned to making preparations for a new crop. Potatoes are being lifted to make way for Wheat. Manure that is to be carted out to leas has to be turned in the dunghill, put out in small heaps at an equal and suitable distance from each other, equally spread over the ground, and ploughed down; and in ground thus prepared a large proportion of the Wheat in the north is sown. Grass is now getting very bare, and sheep and cattle are looking for a supply of Turnips. The weather for some time has been

particularly favourable for the growth of Turnips, and although a smaller breadth than usual has been sown, we expect from the heavier crop to have about an average quantity. At last Muir of Ord market there was an unusually large number of sheep exhibited, for which there was little demand, at a greatly reduced price; and the likelihood being that a larger number than usual will be wintered here, there is a keen competition for Turnips at an advanced price.

Notices to Correspondents.

PERRY MAKING: *F. D* says—The Pears are to be ground and pressed through a hair cloth; allowed to remain 24 hours in a vat to settle; the casks to be filled within four inches, and as soon as the "hissing" (*i. e.* fermentation) ceases, bung down, and in a month it will be fit for use.

RATES OF PAYMENT: *A F B.* The following rates are taken from a past volume of the *Agricultural Gazette*:—

	Piece Work. £ s. d.	£ s. d.	
OCCASIONAL OPERATIONS.			
1. Earth-work in drainage from	0 0 2	to 0 0	2¾ per cubic yd
2. Grubbing up old fences, from	0 0 6	„ 0 2	6 per perch
3. Paring and burning old ground, from	1 0 0	„ 1 10	0 per acre
Clay-burning, 100 yds. p. acre		4 0	0 per acre
4. Quarry-work — road-stones, from	0 0 3	„ 0 0	4 per yard
Building-stones, from ...	0 0 5	„ 0 0	6 „
Flag-stones, from ...	0 0 6	„ 0 1	0 „
Breaking stones, from ...	0 0 5	„ 0 0	10 „
5 & 6. Building and carpenter's work (see p. 379, vol. for 1846).			
7. Road-making, 4 yards wide, 9 inches deep	0 15 0	„ 1 0	0 per perch
ANNUAL FARM OPERATIONS.			
(a) *Tillage Operations.*			
	Day Work.		
1. Subsoil ploughing—4 horses and men		0 19	3 per acre.
2. Ploughing—2 horses and man	0 5 0	„ 0 15	0 „
3. Harrowing (each tine) ...	0 0 4	„ 0 0	8 „
4. Scarifying—2 horses and man	0 2 6	„ 0 3	6 „
5. Rolling		about 0 1	0 „
(b) *Management of Manure. Measure before each Operation.*			
1. Filling into carts in yard ...		about 0 0	0¾ per cubic yd
2. Hauling to heap		about 0 0	1 „
3. First turning		about 0 0	0½ „
4. Second turning		about 0 0	0¾ „
5. Loading into carts

(g) *Management of Stock.*			
Blacksmith's bill per pair of horses, excepting new metal	3 0 0	per annum	
Saddler's bill per pair of horses	1 0 0		

SALT: *A H H.* We would sow 1 cwt. per acre broadcast in wet weather four times; once in autumn, and again in the end respectively of February, March, and April. You should sow your Wheat with tolerably wide intervals, say 10 or 12 inches, so as to let the sunshine have its full effect.

SALT AND LIME: *C S.* You had better just slake the hot lime with strong brine, and apply 30 or 40 bushels per acre now, either as powdered lime out of a cart, or in compost with earth broadcast over the Grass land.

TO CLEAR A POND AND USE THE MATERIAL REMOVED: *Northwood.* We would let the mud drain a bit, and then mix it in layers with unslaked lime, and in a few days turn it over. If your object is to keep the water clear for the future, burn some six inches of the clay on which it rests, and spread the burned material, as they are doing in the lakes at Sydenham. Water Lilies are easily cultivated.

ERRATUM.—In the article on Rape Cake for Feeding, page 651, 15 lines from the bottom, read, "a pound of beef, reckoned as dry material, will cost about 1*s.*, when beef is at 6*d.* per lb.; and a pound of milk, reckoned as dry material, will cost 6*d.* when milk sells at 2*d.* per quart, a price at which it enters largely into consumption," &c. &c.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£ s. d.
Patent Pump	1 15 0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3 0 0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

FOR FENCING AND ALL OUTSIDE WOOD OR IRON-WORK.
WILSHERE AND CO.'S WATERPROOF BLACK VARNISH is the best article that can be used. One coat will go as far as two of ordinary paint. It bears a rich gloss. 4*s.* per gallon. Discount on large orders.—2, Talbot Court, Gracechurch Street, London.
Agent—14, St. David Street, Edinburgh.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

TO FLORISTS AND OTHERS.

J. JONES, Iron Merchant, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. Jones, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON and PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

METCALFE and CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at Metcalfe, Bingley, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

Caution.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

The Successful Results of the last Half Century have proved beyond Question that

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. Caution.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. Rowland & Sons, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as Emily Dean's CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling of, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2s. per Package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss Dean, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of Moustachios." H. Adams.—"It has prevented my Hair falling off." J. Bickson.—"It has quite checked the greyness that was coming on." Mrs. Elder.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. Douglass, 18, Holland Street, Brixton, London.

NERVOUSNESS.—A gentleman having come into possession of valuable receipes for the cure of Nervousness, Female Complants, and Consumption, will be happy to forward them gratis on receipt of a directed stamped envelope.—Address, Mr. D. Offord, 67A, Great Russell Street, Russell Square, London.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1s. 1½d. per box.—Observe that "Thomas Prout" is on the Government stamp.

HOLLOWAY'S PILLS AN INCOMPARABLE MEDICINE FOR THE CURE OF BILE AND INDIGESTION.—Extract of a letter from Mr. James Henshall, of Ashton-under-Lyme, dated June 28, 1854:—"To Professor Holloway—Sir,—I was for a considerable period afflicted with indigestion, attended with frequent sickness and loss of appetite, giddiness, headache, drowsiness, and dimness of sight, together with a disorganised constitution, which defied the effects of a variety of reputed medicines; and deriving no benefit from them whatever, I commenced taking your Pills, and am bound, in gratitude, to confess that they have been the sole means of curing me, as I now enjoy perfect health."—Sold by all Vendors of Medicine, and at Professor Holloway's Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

PARR'S LIFE PILLS.

THE English public have, by the test of experience, become satisfied that PARR'S LIFE PILLS are composed of simple but powerfully curative ingredients. They are so mild and excellent in their action that a child may take them. For Bilious Disorders, Liver Complaints, Indigestion, Costiveness, Sick Headache, Depression of Spirits, Pains in the Back, Gravel, and Lumbago, Parr's Life Pills will be found a safe and admirable remedy. Invalids should make an immediate trial of this excellent, long-tried, and successful medicine.

TO LADIES.

Parr's Life Pills are especially efficacious in all the variety of ailments incidental to the fair sex. Ladies, even of the most delicate constitutions, will find them particularly beneficial both before and after confinement; and, for general use in schools, they cannot be too strongly recommended. They mildly and speedily remove all skin eruptions, sallowness of complexion, nervous irritability, sick headache, depression of spirits, irregularity, or general derangement of the system.

Observe the signature of the proprietors, "T. Roberts & Co., Crane Court, Fleet Street, London," on the directions. Sold in boxes at 1s. 1½d., 2s. 9d., and family packets at 11s. each, by all respectable chemists and medicine vendors in town and country. Full directions are given with each box.

☞ Be sure to ask for Parr's Life Pills.

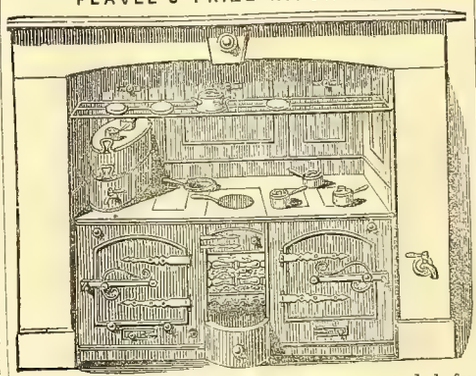
DEANE, DRAY, and CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge. Established A.D. 1700.

TEN THOUSAND STOVES.

THE TENTH THOUSAND of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 46, King William Street, London Bridge; and may be obtained of most Ironmongers.

The IMPROVED PATENT VENTILATING STOVE, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded post free.

FLAVEL'S PRIZE KITCHENER.



THESE RANGES are strongly recommended for their simplicity of construction and their economy and cleanliness in use. The top forms a Hot-plate, and the open fire removes many of the objections which are felt to close Ranges. They are made in all sizes, from 3 feet to 18 feet in width, suitable for large or small establishments. They are admirably adapted for the Cure of Smoky Chimneys.

London agency removed to Wigmore Street, from 92, Jermyn Street, Piccadilly.

BENHAM & SONS, 19, Wigmore Street, London.

And in the Hardware Court of the Crystal Palace, Sydenham.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit William S. Burton's SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2l. 14s. to 5l. 10s.; ditto, with ormolu ornaments and two sets of bars, 5l. 10s. to 12l. 12s.; with ormolu ornaments and two sets of bars, 5l. 10s. to 12l. 12s.; Steel Fenders from 2l. 15s. to 6l.; ditto, with rich ormolu ornaments, from 2l. 15s. to 7l. 7s.; Fire-irons from 1s. 9d. the set to 4l. 4s. Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

PAPIER MACHE and IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

New oval Papier Maché Trays, per set of three	...	...	...	from 20s. to 10 guineas.
Ditto, Iron ditto	...	...	...	from 13s. to 4 guineas.
Convex shape, ditto.	...	...	...	from 7s. 6d.

Round and Gothic Waiters. Cake and Bread Baskets equally low.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced William S. Burton to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are now ON SHOW in one of his TEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz. from 12s. 6d. (two lights) to 16l.

LAMPS OF ALL SORTS AND PATTERNS.—The largest, as well as the choicest, assortment in existence of FRENCH and ENGLISH MODERATEUR, PALMER'S, CAMPHINE, ARGAND, SOLAR, and other LAMPS, with all the latest improvements, and of the newest and most *recherché* patterns, in ormolu, Bohemian, and plain glass, or papier-mâché, is at William S. Burton's, and they are arranged in one large room, so that patterns, sizes, and sorts can be instantly selected.

Real French Colza Oil, 4s. 6d. per gallon.

Palmer's Candles, 9d., 9½d., and 10d. per lb.

DISH COVERS AND HOT-WATER DISHES in every material, in great variety, and of the newest and most *recherché* patterns. Tin Dish Covers, 6s. 6d. the set of six; Block Tin, 12s. 3d. to 28s. 9d. the set of six; elegant modern patterns, 34s. 0d. to 58s. 6d. the set; Britannia Metal, with or without silver-plated handles, 76s. 6d. to 110s. 6d.; the set: Sheffield Plated, 10l. to 16l. 10s. the set; Block Tin Hot-water Dishes, with wells for gravy, 12s. to 30s.; Britannia Metal, 22s. to 77s.; Electro-plated, on Nickel, full size, 11l. 11s.

William S. Burton has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

39, OXFORD STREET (corner of Newman Street); Nos. 1, 2, and 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last 11 years, and is applicable to every kind of single and double Rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7s. 6d. in postage stamps, cash, or Post-office order, payable at the General Post-office, to Dr. Herbert Leslie, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 3 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

NOW IN SEASON.

TO LOVERS OF FISH.—100 Genuine Yarmouth Bloaters for 6s., package included, forwarded to all parts on receipt of Penny Postage Stamps, or Post Office Order for the amount preferred.

Address, Thomas Lettis, Jun., Fish Curer, Great Yarmouth.

GLENFIELD PATENT STARCH, used in her Majesty's Laundry, and Wotherspoon's machine-made CONFECTIONARY, MARMALADE, JAMS, JELLIES, &c., which gained the Prize Medal of 1851, may be had of all Grocers; Wholesale of Wotherspoon, Mackay, & Co., 66, Queen Street, Cheapside, London; and Robert Wotherspoon & Co., Glasgow.

NOTICE.

OVER COATS, CAPES, &c.—One of the largest stocks in London of every description, first-class garments, at lowest charges; also of Youth's ditto, all made thoroughly impervious to rain, without extra charge, or made to order at a day's notice.—W. Berdoe, 96, New Bond Street, and 69, Cornhill (only).

BLAIR'S GOUT and RHEUMATIC PILLS Price 1s. 1½d. and 2s. 9d. per box.—Mr. William Courtney, of Barton Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills; they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "Thomas Prout, 229, Strand, London," is impressed upon the Government stamp.

DR. DE JONGH'S

LIGHT BROWN COD-LIVER OIL, Prepared for Medicinal use in the Loffoden Isles, Norway, and put to the test of chemical analysis, the most effectual remedy for Consumption, Bronchitis, Asthma, Gout, Chronic Rheumatism, and all Scrofulous Diseases.

Approved of and recommended by Berzelius, Liebig, Wöhler, Jonathan Pereira, Fouquier, and numerous other distinguished Scientific Chemists, prescribed by the most eminent Medical Men, and supplied to the leading Hospitals of Europe—effecting a cure or alleviating symptoms much more rapidly than any other kind.

Extract from THE LANCET, *July* 29, 1854.

"After a careful examination of the different kinds of Cod Liver Oil, Dr. de Jongh gives the preference to the Light Brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod Liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. In the preference of the Light Brown over the Pale Oil we fully concur.

"We have carefully tested a specimen of the light brown Cod-liver Oil prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. Ansar, Harford, & Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by

ANSAR, HARFORD, and CO., 77, STRAND, LONDON, Sole Consignees and Agents for the United Kingdom and the British Possessions, and may be obtained from respectable Chemists and Druggists in town and country, at the following prices: Imperial Measure, half pints, 2s. 6d.; pints, 4s 9d.; quarts, 9s.

*** Four half-pint bottles forwarded, carriage paid, to any part of England on receipt of a remittance of Ten Shillings.

VALUABLE REMEDIES FOR THE AFFLICTED.

DR. ROBERTS'S Celebrated Ointment, called the POOR MAN'S FRIEND, is confidently recommended to the Public as an unfailing remedy for wounds of every description, a certain cure for Ulcerated Sore Legs, of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples on the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1s. 1½d. and 2s. 9d. each.

Also his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience to be, without exception, one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are used in Scrofulas, Scorbutic Complaints, Glandular Swellings, particularly those of the neck, &c. They form a mild and superior Family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 22s. Sold Wholesale by the Proprietors, Beach and Barnicott, at their dispensary, Bridport; by the London houses. Retail by all respectable Medicine Vendors in the United Kingdom.

Observe.—No Medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott, late Dr. Roberts, Bridport," is engraved on the Government Stamp affixed to each package.

Price 3s. 6d., free by post,

PERMANENT AND LAWN GRASS SEEDS.

WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth, *have a fine stock of* NEW GRASS SEEDS, *and can supply any quantity for present sowing.*

Also new Winter Tares, White Mustard, Trifolium incarnatum New Italian Rye-grass, &c.

WILLIAM E. RENDLE & Co., Seed Growers, Plymouth.

TO BE SOLD, a WARDIAN CASE of rare LIVE PLANTS, just imported in good order from Port Louis, Mauritius, where they were collected and classified by Professor BOJER, Curator to the Royal Botanical Gardens. These Plants, of which there are 36 varieties, were imported by a gentleman lately deceased. A List of the Plants and the Plants themselves may be seen between the hours of 10 and 4 o'clock, at Messrs. BELL, BUDDEN, & Co.'s Offices, 2, Jeffrey's Square, St. Mary Axe, London.

CHOICE NEW GERANIUMS, &c., AT REDUCED PRICES.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, having a large stock of the following NEW GERANIUMS in 4-inch pots, good, strong, healthy, well-established plants, begs to offer them, at purchaser's selection, 36*s.* per dozen, viz.—Empress, Leah, Neatness, Picta, Rebecca, Marginata, Eliza, Helen, Glow-worm, Virginia (Hoyles), Attraction, Purple Perfection, Indian Chief, Majestic, Regalia, Governor-General, Carlos, Zeno, Tamberlik, Rosa, Lucy, Duchess of Wellington, and Rhoda. Choice varieties of 1853, strong plants, 15*s.* per dozen. Fine old show varieties, 6*s.*, 9*s*, and 12*s.* per dozen. Fine spotted French varieties, which are very showy and attractive, 2*s.* 6*d.* each. Choice fancy varieties, 9*s.*, 12*s.*, and 18*s.* per dozen.

CINERARIAS, from a collection of more than 100 of the best varieties, new of last season, 18*s.* per dozen; choice older varieties, 6*s.*, 9*s*, to 12*s.* per dozen.

PANSIES, of which H. W. has several thousands of plants of the best in cultivation, 4*s.* 6*d.*, 6*s.*, 9*s.*, 12*s.*, and 18*s.* per dozen.

CARNATIONS AND PICOTEES, fine show varieties, 9*s.*, 12*s.*, to 30*s.* per dozen pairs, or 25 pairs for 21*s.*

HOLLYHOCKS, including the best varieties out, 6*s.*, 9*s.*, 12*s.*, to 30*s.* per dozen.

All the newest and best FUCHSIAS of this season, 1*s.* 6*d.* and 2*s.* each, or 18*s.* per dozen.

VERBENAS: new varieties of this season, 1*s.* each, or 9*s.* per dozen.

PETUNIAS: new varieties of this season, 1*s.* 6*d.* each, or 15*s.* per dozen.

Also a large collection of FERNS AND LYCOPODS at very low prices. Parties intending to make a select collection would do well to inspect H. W.'s catalogue

Collections of STOVE AND GREENHOUSE PLANTS at reduced prices.

CINERARIA SEED from the best varieties, 1*s.* 6*d.*, 2*s.*, and 2*s.* 6*d.* per packet, post free.

Descriptive Lists of the above now ready, and may be had for one postage stamp. A remittance is respectfully requested from unknown correspondents, made payable at Marsden, Lancashire.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria in bricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
„ insignis, 2 to 7 feet
„ Menziesi, 3 to 7 feet
„ pinsapo, fine plants, 3 to 6 feet
„ Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
„ nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
„ Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
„ thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
„ chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
„ Irish, 4 to 10 feet
„ gold-striped, 1½ to 3 feet
„ do., tall standards, 4 to 7 ft.
„ Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
„ Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for GERANIUMS (show and fancy), FRENCH GERANIUMS, FUCHSIAS, VERBENAS, FAIRY ROSES, CHRYSANTHEMUMS, HELIOTROPES, CINERARIAS, CALCEOLARIAS, PRIMULAS, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

The stock of show Geraniums exceeds 50,000, and comprises upwards of 750 varieties, amongst which almost every known kind will be found. The newest sorts, such as Carlos, Virginia, Rosa (Foster's), Leah, Picta, Marginata, Empress, Neatness, &c., can be had at 3*s.* 6*d.* each, or 40*s.* per dozen. The older varieties from 9*s.* to 25*s.* per dozen.

The selection of FRENCH GERANIUMS consists of 40 distinct sorts (exclusive of those English Geraniums which some class with them), at 2*s.* 6*d.* each, or 25*s.* per dozen.

SEEDLING CINERARIAS (10,000), from seed of first-rate flowers, at 4*s.* per dozen, in 60-sized pots.

20,000 SEEDLING HERBACEOUS CALCEOLARIAS now on hand at 4*s.* per dozen in 60-sized pots. These flowers have been raised from the seed of the best of last year's stock, which received general praise.

An immense quantity of good fimbriated PRIMULAS at 4*s.* per dozen in 60-sized pots, and 6*s.* per dozen in 48's.

CHRYSANTHEMUMS (Lilliputian and large flowering) at 6*s.* and 9*s.* per dozen for plants which will flower this season. Large magnificent plants at 18*s.* and 15*s.* per dozen—all the best sorts.

The foregoing have been selected as examples only, it being impossible within the limits of an advertisement to afford particulars of a stock so extensive; Catalogues will, however, be forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, PROPRIETOR.

NEW FANCY GERANIUMS.

JOHN HALLY, NURSERYMAN and FLORIST, Blackheath, begs to offer the following distinct and first-rate Fancy Geraniums, which have been raised by a first-rate grower, and highly admired by all judges who have seen them. They will be ready the beginning of November.

1. ENCHANTRESS.—Upper petals deep rosy crimson, with white edge, lower petals having a crimson spot on French white ground; of superb form and a very free bloomer, with dwarf habit. Received a First Class Certificate at the Regent's Park Exhibition, June 21. 10*s.* 6*d.* each.

2. ECLIPSE.—Upper petals deep lilac crimson, with white margin, lower petals having a be t of rosy lilac, with large white eye, and ring of white round the outside. Flower good in shape, and above the average size. 10*s.* 6*d.* each.

3. COMPACTUM.—Upper petals dark velvety crimson, very smooth lower petals, having a crimson lilac spot, with white eye; a remarkably free bloomer, and of dwarf habit. 10*s* 6*d.* each.

4. MARY JANE.—Upper petals silvery lilac, margined with white, lower petals white, spotted with lilac; new in colour, free bloomer, and of dwarf habit. 7*s.* 6*d.* each.

5. FORMOSISSIMA SUPERB. A Cape cross, pure white, with large mulberry spot on the upper petals; flower of good form and substance. Exhibited June 21st, at Regent's Park. 7*s.* 6*d.* each.

The above set for 2*l.* 2*s.*, with the usual allowance to the trade. A remittance must be made by unknown correspondents. Post-office orders to be made payable at Blackheath.

WANTED, DUTCH BOX-EDGING, from 100 to 1000 yards. Any person having the above to dispose of, a Nurseryman will be glad to exchange either Evergreens, Greenhouse Plants, or anything in the nursery way for the same. State the number of years it has been planted, and where it can be be seen, by post, to Y. Z., office of this Paper.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 11*s.* per ton; ditto, delivered 5 miles, 16*s.* per ton. Loam and Peat at moderate prices.—KENNARD BROTHERS, Swan Place, Old Kent Road, London.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the Crystal Palace, Sydenham, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. Conservatories and Aviaries fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. Window blinds of every possible description, of the very best materials and workmanship.

N.B. An allowance to nurserymen and the trade.

GARDEN NETS, FISHING NETS, SHEEP NETS, AND RABBIT NETS, made by Machinery, and supplied at very low terms. Samples sent free.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide, 1*s.* per yard run—admits light and excludes cold; thick Canvas Tarpauling, 1*s.* per square yard; thick Canvas Waxed Sheeting, 1*s.* per square yard, may be had various widths. These Canvases are excellent for roofing Sheds and Outhouses, as they are quite waterproof.—R. RICHARDSON, 21, Tonbridge Place, Judd Street, New Road, London. N B. Waterproof Capes, large size, 3*s.*; Police Capes, 18*s.* and 24*s.* per dozen; Driving Aprons, Capes, and Coats of India Rubber, Horse's Loin Cloths, Waggon and Cart Covers, Sacks, &c.

LANDSCAPE GARDENING REVIVED AS AN ART.

MR. THOROLD, of Thorpe Bower, near Norwich, continues to offer his services to Ladies and Gentlemen in laying out or re-arranging their Gardens and Pleasure Grounds on correct principles of taste, in any style, or combination of styles, suitable to the requirements of all kinds of residences, upon any scale, and in most cases to produce immediate effect. Mr. T. can give ample references as to his success.

TO BE LET, by tender, a FARM on HAFODUNOS ESTATE, North Wales, comprising 328 acres, great portion of which has been thoroughly drained, sub-soiled, and highly improved, and the remainder is now being similarly treated. The House will be altered and additional buildings erected to suit the tenant. Hafodunos is 9 miles from Abergele, 6 from Llanrwst, 10 from Conway, and 13 from Denbigh.—Application to inspect the farm to be made to Mr. SCOON, Bailiff, Hafodunos, by Llanwrst, and further particulars may be obtained from Mr. PALIN, Christleton, near Chester, to whom offers in writing are to be made.

MONMOUTHSHIRE.

TO BE LET, for a term of years, and entered upon at Lady-day next, the FARM of LLANVAIR GRANGE. It consists of 164 acres of rich productive Land, of which 4 acres are in Orchard, 76 in Meadow and Pasture, and 84 are Arable. There is a comfortable Farm-house and Garden, Dairy and Cheeseroom, and ample Farm Buildings on the Farm. It is within a short distance of the Pontypool Iron Works; there is a station on the Newport and Hereford Railway close by. At the Iron Works there is a constant demand for every kind of Farm produce. The proprietor at Llanvair Grange will direct some one to show the Farm; and for particulars apply to Mr. JOHN MORTON, Morningside, Nailsworth, Gloucestershire.

TO BE LET, a NURSERY, of six Acres, well adapted for the Growth of Shrubs and Nursery Plants, with good Dwelling-house and Outbuildings. Rent moderate.—Apply to R. BURROWS, Leighton Buzzard.

TO GENTLEMEN, HORTICULTURISTS, AND OTHERS.

TO BE SOLD, reasonable, a SPAN-ROOF GREENHOUSE, 16 feet long, 8 feet wide, thoroughly well seasoned, and fit for immediate use.—For particulars and to view apply to JAMES RHODES, 6, Macclesfield Street, City Road, London.

TO BE SOLD CHEAP, STRONG-BUILT GREENHOUSES, 12 feet long 8 feet wide, 15*l.*; 16 by 10, 20*l*; 18 by 10, 25*l.*; 20 by 12, 35*l.*; 23 by 12 40*l.* Plans and particulars of Mr. SMITH, 1, Lower Road, near Islington Green. Window Blinds, Sashes, Doors, &c, from 6*d.* per foot. Stout Horticultural Glass at 2½*d.* per foot. Orders to all parts.

TO BE SOLD Cheap, the owner not having occasion to erect it, a new strong WOODEN GREENHOUSE, with span-roof to lean to a wall, about 29 feet by 14 feet; and seven Boxes of Glass.—Apply to A. B., Post-office, Sutton Coldfield, near Birmingham.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. FOX'S, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

OVER-STOCKED.

GOLD LACED BANTAMS OR SEBRIGHTS of the purest breed. Negro White Silky India Fowl, unknown in this country. White-faced Spanish Fowl of the best breed of this year.—For particulars apply to A. B. C., Northleigh, near Oxford.

Sales by Auction.

FANCY POULTRY.—PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, London, on TUESDAY, October 17, at 12 o'clock precisely, a CHOICE SELECTION OF POULTRY, including first class Spanish, from Mr. John Clark, of Hartley Row; Cochins of excellent quality (buff and white), from the Rev. CAMELLIAS, RHODODENDRONS, AZALEAS, DEUTZIA GRACILIS.

A SECOND CONSIGNMENT FROM MR. J. BAUMAN, OF GHENT, FOR ABSOLUTE SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, 27th October, at 12 for 1 o'clock, 800 Camellias, of good sorts, with flower buds; 100 Yellow Rhododendrons; 100 Ghent Azaleas; 200 Deutzia gracilis; 3 Otaheite Oranges and other Orange Trees; and 1000 Gladioli.—May be viewed on the morning of sale, and catalogues had.

BLACKHEATH.

TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, on the premises, Westpoint Nursery, Blackheath, on THURSDAY, October 26th, and following day, at 11 o'clock each day, without reserve (by order of Mr. Thompson), in consequence of the ground being taken for building purposes, the whole of the valuable Stock of Evergreens, fine Standard and Dwarf-trained Peaches, Nectarines, Apricots, Cherries, Standard Plums, Pears, Gooseberries, and Currants; about 2000 fine Standard and Dwarf Roses, a quantity of Box Edging, Clematis, Jasmine, &c.; also 200 fine Double Camellias, specimen Azalea indica, Epacris Acacias, Aphelexis, Ericas, Eutaxia Corræa, &c.; with two capital Iron Rollers, and sundry effects.—May be viewed one week prior to the Sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET GARDENERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the administrators of the late Mr. Joseph Fairbairn to sell by Auction, on the premises, The Retreat, Larkhall Lane, Clapham, on MONDAY, October 23d, and following days, at 11 o'clock each day, the whole of the valuable stock of FRUIT TREES, consisting of Standard, Dwarf, Trained and Untrained Peach, Nectarine, Apricot, Apple, Pear, Plum, Cherry, Gooseberries, and Currants, &c.; also Ornamental Trees, Evergreens and Deciduous shrubs, &c.—May be viewed one week prior to the Sale. Catalogues to be had (6*d.* each, returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

STOKE NEWINGTON.

TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS beg to announce that they have received instructions from the Administrators of the late Mr. W. Watts, of Stoke Newington, to Sell by Auction, without reserve, on the premises, on MONDAY, October 30, and three following days at 11 o'clock each day, the whole of the valuable Nursery Stock, consisting of an immense quantity of American Plants, Ornamental and Fruit Trees, Evergreens, and Deciduous Shrubs, comprising 85,000 Rhododendrons, 5000 Ghent Azaleas, 2000 Limes, 1200 Thorns, 1000 Poplars, Planes, Elms, Laburnums, Chesnuts, &c., Standard and Dwarf Trained Peach, Nectarine, Apricot, Apple, Pear, Plum, Cherry, Gooseberries, and Currants; Standard Damsons; 1200 fine Mulberries, &c.; 5000 Arbor-vitæ, 6000 Hollies, 3 feet; 4000 Box, 7000 Aucubas, 3000 Euonymus, Perpetual and Common Laurels, Lilacs, Roses, Daphnes, Yucca Filamentosa, &c.; also Greenhouse Plants, including 200 fine Double Camellias, 50 very fine specimen Indian Azaleas, Heaths, Epacris, &c.; together with Greenhouses, 2 and 3-light Boxes, Gold and Silver Fish in Ponds, an excellent Horse, two capital Carts, Wheelbarrows, Garden Tools, a quantity of Box-edging, and sundry effects.—May be viewed one week prior to the Sale. Catalogues may be obtained (6*d.* each, returnable to purchasers) on the premises of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CHOICE AND VALUABLE COLLECTION OF TULIPS.

THE PROPERTY OF THE LATE MR. J. J. JAQUES.

MR. ALEXANDER is instructed by the executors of the late Mr. Jaques, to offer for Sale by Auction at the Mart, Bartholomew Lane, near the Bank of England, on WEDNESDAY, October 25, at 12 o'clock, without the least reserve, the well-known collection of TULIPS, comprising all the leading varieties in cultivation, viz., Pandora, Salvator Rosa, Louis XVI., Thalia, Parmegiano, Democrat, Violet Alexander, Rose Lac, Camuse de Craix, Ponceau Brilliant, Arlette, Jeffrey's Elizabeth, Jenny Lind, Strong's King, Marcellus, Pompe Funèbre, Vivid, Duke of Sussex, &c.—May be viewed on the morning of Sale; Catalogues had at the Mart, of Dawe, Cottrell, and Benham, Seedsmen, Moorgate Street; White Swan, West Ham. Mr. Jaques, King Street, Cambridge Road; also of the Auctioneer, Shacklewell

---

IMPORTANT & EXTENSIVE SALE OF NURSERY STOCK.

BROMLEY HILL NURSERY, KENT.

MR. T. BAXTER is directed to Sell by Auction on WEDNESDAY, October 25, and following days, on the premises, comprising several thousands of Laurels, Laurustinuses, common and variegated Hollies and Box, Larches and Firs of sorts, Oaks, Elms, Beech, Spanish and Horse Chesnuts, fine Cedars and Yews, Poplars, Weymouth Pines and Evergreens, and Shrubs of the various sorts. 6000 transplanted quick Fruit Trees of the best sorts, and fine Mulberries, &c. A splendid large, and very fine-grown Purple Beech, and less ditto; well-rooted, young and thriving plants. May be viewed 10 days prior to the Sale, and Catalogues had of Messrs. BECK and ALLEN, Seedsmen, Strand, London; Dover Castle, Deptford; and of the Auctioneer, Bromley, Kent.

FIRST-CLASS ORCHIDACEOUS AND STOVE AND GREENHOUSE PLANTS, TULIPS, ETC.

MESSRS. HAMMOND AND OLDFIELD are instructed by that eminent Floricultural Amateur John Willmore, Esq., of Apsley House, Edgbaston, to offer for Unreserved Competition, on MONDAY, October 23, at the Nursery of Messrs. Cole and Sharp, Birchfields, near Birmingham, where they will be removed for convenience of sale the whole of his choice and celebrated COLLECTION of ORCHIDS, STOVE and GREENHOUSE PLANTS, TULIPS, &c., the cultivation of which he is declining for exhibition purposes. It consists of Vandas, Aërides, Saccolabiums, Cattleyas, Dendrobiums, Azaleas, Ericas, Epacrises, Eriostemons, &c. &c.; about 50 rows of the leading varieties of Tulips in cultivation, all of which will be found true to name, and in fine condition.

The Auctioneers consider it would be altogether superfluous to expatiate upon the quality, variety, and value of the specimens comprised in this collection, in consequence of the high position which they have for a considerable number of years uniformly maintained at the principal exhibitions of the Midland Counties.

Catalogues, which will be ready in a few days, may be had of the Auctioneers, at their offices, Waterloo Street, Birmingham; or of Messrs. COLE and SHARP; and the whole may be viewed at the Nursery as above, on the Friday and Saturday previous to the day of sale.

HORTICULTURAL BUILDING

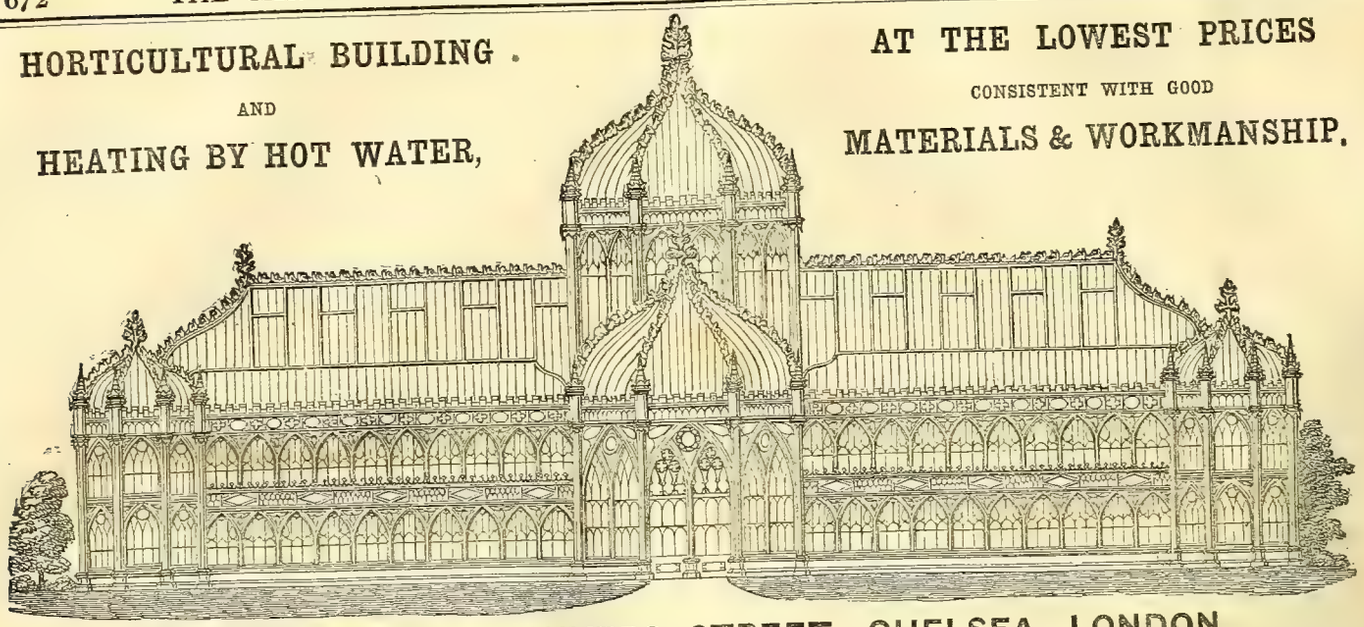
AND

HEATING BY HOT WATER,

AT THE LOWEST PRICES

CONSISTENT WITH GOOD

MATERIALS & WORKMANSHIP.



GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.

	Nonsuch	Rubens
	Ondine	Alderman.

Horticultural Gardens, Norwich.

CRIMSON PERFECTION RHUBARB.

ROBERT SALT, of Longton, Staffordshire, begs to inform the Gentry, Nurserymen, and Gardeners, that this splendid variety of Rhubarb is now ready for distribution, and shall feel happy to serve all parties who may favour him with their orders.

R. S. begs to state that it is the most splendid, early, and prolific variety ever offered to the public. Orders addressed to ROBERT SALT, Longton; Messrs. Hurst and M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess and Kent, Pen Street, Hull; Messrs. Francs and Arthur Dickson, Eastgate Street, Chester, will have immediate attention. Price 7s. 6d. per root, three for one guinea, and six for 2l. A liberal discount allowed to the Trade.—Longton, Oct. 14.

STRAWBERRIES.

BARRATT'S MAGNUM BONUM.—In size, this splendid Strawberry very far surpasses the "British Queen," is an exceedingly heavy cropper, and continues in perfection later than almost any other variety. Its flavour is really delicious, most nearly approaching the true Pine Apple of any kind yet known. Price per 100, 2l. 2s.; per dozen, 6s. Good strong Plants of the above are now ready for sending out by

St. John's Nursery, Wakefield. WM. BARRATT.

N.B. W. B.'s List of 40 kinds of Strawberries may be had gratis. Also his Catalogue of Dutch Roots, Herbaceous Plants, Irises, and Chrysanthemums, may be had on application.

NICHOLSON STRAWBERRIES REDUCED IN PRICE.

WILLIAM NICHOLSON is now sending out strong well-rooted Plants of his four new and distinct Strawberries, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy; RUBY, ditto, a great bearer, and forces well; CAPTAIN COOK, market fruit, large, and a great bearer; FILLBASKET, ditto, 6s. per 100, box included. Most of the old and new sorts can be supplied.

*** See Mr. J. W. KINMONT'S remarks on the above Strawberries, printed in No. 31, 1854, page 501, of this Paper.

Post-office Orders, payable at Yarm, Yorkshire, or a cash remittance required with the order.

Egglescliffe, near Yarm, Oct. 14, 1854.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50s.; 50, 30s.; and 25, 16s. Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5s. per 100.

Manor Farm, Deptford, October 14.

GOLIATH STRAWBERRY.—This well tested and excellent variety has now outgrown all the prejudice that has been raised against it, and has fully borne out the high character which was at first given of it; and most, if not all the market gardeners in this neighbourhood, as well as gentlemen, are growing it very extensively. It has proved itself to be the very best in the absence of its parent, the British Queen, or where that variety does not succeed.

A Post-office order for 3s. 6d., or stamps to that amount, will secure 100 strong well-rooted plants, package included; or 1s. 6d. for six plants, by post, to any part of the kingdom. Also Trollope's Victoria, the very best for forcing, 3s. 6d. per 100.

Also the following varieties at 2s. 6d. per 100:—British Queen, Black Prince, Eleanor, Keens' Seedling, Elton Pine, Myatt's Surprise, Comte de Paris, and Hooper's Seedling.

JAMES KITLEY, Lyncombe Vale Nursery, Bath.

STRAWBERRIES.—*This is the best time for planting Strawberries, especially after the late rains we have had. The Subscribers have a very superior stock of the following choice varieties:—*

INGRAM'S PRINCE OF WALES.—The principal sort grown at Frogmore for the Royal table, 20s. per 100.

PINCE'S NIMROD—highly recommended by Lucombe, Pince, & Co., 40s. per 100.

NICHOLSON'S AJAX ... ... } Four excellent varieties, fully described by Mr. Nicholson. Price 7s. 6d. per 100.
" RUBY ... ... }
" CAPTAIN COOK }
" FILLBASKET ... }

TROLLOPE'S VICTORIA—A very superior and most prolific variety, 5s. per 100.

CUTHILL'S BLACK PRINCE—5s. per 100.

KITLEY'S GOLIATH—5s. per 100.

All the other choice varieties in cultivation. For prices and further particulars, consult RENDLE'S NEW AUTUMNAL CATALOGUE, *just out, to be had in exchange for two penny stamps.*—Apply to

WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, Oct. 14, 1854.

BRITISH POMOLOGICAL SOCIETY. — The FIRST EXTRAORDINARY MEETING of the BRITISH POMOLOGICAL SOCIETY will be held on MONDAY, 6th November next, at the Rooms, 20, Bedford Street, Covent Garden, London. The objects of this Meeting are to receive and exhibit Collections of Fruits from different parts of the country, and to ascertain their adaptability to the various soils and climates of Great Britain; to report upon the merits of new varieties; and to furnish the correct names of any varieties which may be submitted for that purpose.

All who are concerned in the cultivation of Fruits are invited to send collections of as many varieties as can be obtained; and to accompany them with a statement as to the soil, exposure, and latitude in which they were grown. All Collections should be forwarded before the 4th of November, addressed to the SECRETARY, 20, Bedford Street, Covent Garden, London.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.

Seed Establishment, 181, High Holborn, London.

LARGE EVERGREENS, ETC.

JOHN ADAMS, NURSERYMAN, Park Lane, Brompton, near the "Hoop and Toy," calls the attention of gentlemen and the trade engaged in autumn planting to his extensive stock of LARGE EVERGREENS, comprising Hollies, Yews, Red Cedars, Siberian, China, and American Arbor vitæ, Tree Box, Edging Box, Laurels, Bays, Cedrus deodara, Pinus excelsa, &c., &c., all of which are in a fine condition for moving.

A fine stock of large Fruit Trees for immediate bearing.

VARIEGATED HOLLIES.

THE SUBSCRIBERS having a large stock of Striped and other Worked HOLLIES, recommend this as a favourable time for removal; in considerable quantities they are sold cheap.—WM. URQUHART & SONS, Dundee.

FINE SPECIMEN PLANTS.

J. AND J. FRASER beg to invite attention to their magnificent Collection of large AZALEAS, HEATHS, and other Plants, which were never in such good condition as at the present time. This is an excellent opportunity for buyers as (on account of not having sufficient room) the plants will be offered at very low prices.

The Nursery, Lea Bridge Road, Essex.—Oct. 21.

CHARLES DALY AND SON beg to offer the following:—One year Seedling Thorns, at 1*s.* 6*d.* per 1000; Two years Transplanted, 6*s.* do. Laurel, 10*s.* per 1000; Portugal do, 4*s.* per 100, good plants. Irish and Spread Yews. 'Bushes for Hedges, Forest Trees, Seedlings do, and Grass Seeds cheap.

Prices sent free by Post.—Coleraine, Oct. 21.

J. SMITH AND SONS, Tansley, near Matlock, begs to offer cheap, an over-stock of one or two years' Seeding OAK, one year's BEECH, and one year's SYCAMORE; also Transplanted Beech, in sizes from 1½ to 5 feet. Price, according to quantity required, on application.

PEACH TREES AND VINES.

TO BE SOLD, Forty PEACH and NECTARINE TREES, of best sorts, two and three years trained, without cutting back; have been grown under glass, and would bear a crop the same season of planting; price 5*s.* each. Also, One Hundred BLACK HAMBURGH, and One Hundred MUSCAT of ALEXANDRIA VINES, struck from eyes this year, from 3 to 4 feet high, well ripened, and warranted true; price 1*s.* each.

Apply to WILLIAM LUCKETT, Rabbly Cottage, Shenley, Herts.

TO BE SOLD, VINES, from Eyes, the best out, some of which have been fruited in pots.—Apply to Mr. J. JENNER, Priory Nursery, Priory Grove, South Lambeth.

IMPORTANT TO POTATO GROWERS.

E. P. FRANCIS' List of ROSES, containing all the new varieties worth cultivating, with a stock of 5000 dwarfs in 150 sorts, most successfully grown on the Manetti Stock, is now ready for delivery, and will be forwarded to any amateur, gratis, on application.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER'S descriptive List of the above splendid flowers, containing hints on their culture, and observations on exhibiting, &c., is now ready, and may be had on application, by forwarding one postage stamp.—Saffron Walden Nursery, Oct. 21.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Pine-apple Place, Edgeware Road, London.

CARNATIONS, PICOTEES, PANSIES, ETC.

JOHN SCHOFIELD AND SON have now ready strong plants of all the approved CARNATIONS, PICOTEES, PINKS, and PANSIES, as follows:—25 pair of Carnations and Picotees, 1*l.* 1*s.*; 25 pair of Pinks, 15*s.*; 25 Pansies, 1*l.* 1*s.* A Descriptive Catalogue of the above, &c., is ready; also a few packets of Pansy and Hollyhock Seed carefully selected from the finest sorts, 2*s.* 6*d.* per packet.—Knowsthorpe, near Leeds, Yorkshire.

CRIMSON PERFECTION RHUBARB.

ROBERT SALT, of Longton, Staffordshire, begs to inform the Gentry and Nurserymen that this splendid variety of Rhubarb is now ready for distribution, and shall feel happy to serve parties who may favour him with their orders.

R. S. begs to state that it is the most splendid, early, and prolific variety ever offered to the public. Orders addressed to ROBERT SALT, Longton; Messrs. Hurst and M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess and Kent, Parkhall; Messrs. Francis and Arthur Dickson, Eastgate Street, Chester; Mr. Wood, Nurseryman, Nottingham, will have immediate attention. Price 7*s.* 6*d.* per root, three for one guinea, and six for 2*l.* A liberal discount allowed to the Trade. A Post-office Order from unknown correspondents.

VERY FINE ANEMONE ROOTS AND SEEDS.

To the NOBILITY, GENTRY, and CLERGY.

HENRY GIBSON, Floore, near Weedon, Northamptonshire, has now on Sale an unlimited Stock of the finest Striped and other ANEMONE ROOTS, at the following low prices, viz.:—

Selected, all Striped, 10*s.* per 100, or 4*l.* 10*s.* per 1000.

A splendid Collection of Mixed at 3*s.* 6*d.* p. 100, or 1*l.* 10*s.* p. 1000.

Packets of Seed, saved from all the choicest of the Flowers, containing 2000 seeds, 2*s.* each. Sent free of carriage to all parts of England on receipt of a post-office order, on the Weedon Post-office, payable to HENRY GIBSON.

Orders to the amount of 5*s.* can be forwarded in postage stamps.

N.B. Allowed by competent judges to be the best Collection in England.

CHOICE NEW GERANIUMS, FUCHSIAS, ETC.

HENRY WALTON, Florist, &c., Edge End, Marsden, near Burnley, Lancashire, begs to state that he will be prepared to send out nice plants of Foster's, Hoyle's, Beck's, Dobson's, and Henderson's New Geraniums, sent out last autumn, early in October, well established in 4-inch pots, at 36*s.* to 40*s.* per dozen. All the Choice New Fuchsias, sent out last spring, 1*s.* 6*d.* to 2*s.* each, or 18*s.* per dozen. New Verbenas, sent out in spring, 1*s.* each, or 9*s.* per dozen. New Petunias, sent out in spring, 1*s.* 6*d.* each, or 15*s.* per dozen. Choice New Cinerarias, 2*s.* each, or 18*s.* per dozen, or 6 for 10*s.*; older ditto, 6*s.* to 9*s.* per dozen. Pansies, newest and best varieties, 18*s.* per dozen.—Carnations, Picotees, Pinks, &c. &c., equally cheap.

Descriptive Lists of the above may be had for one postage stamp.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50*s.*; 50, 30*s.*; and 25, 16*s.* Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5*s.* per 100.

Manor Farm, Deptford, October 21.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for GERANIUMS (show and fancy), FRENCH GERANIUMS, FUCHSIAS, VERBENAS, FAIRY ROSES, CHRYSANTHEMUMS, HELIOTROPES, CINERARIAS, CALCEOLARIAS, PRIMULAS, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

For further particulars, see Advertisement in last week's *Chronicle*. Catalogues forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, Proprietor.

NEW VARIEGATED GERANIUMS.

JOHN AND CHARLES LEE beg to inform the admirers of Variegated GERANIUMS that they have purchased the Stock of two very promising Seedlings, which are decided improvements on those already introduced by them. The first they have named

MRS. LENNOX,

in compliment to the lady of the raiser, Thomas Lennox, Esq., of Stamford Brook Lodge, Hammersmith. The whole aspect of this plant is very striking, the habit being extremely vigorous, with leaves measuring from 4 inches to 6 inches across, and having a broad margin as white as the driven snow. The trusses are very large, of the most intense scarlet, and stand well above the foliage. The other they have named the

SCARLET FLOWER OF THE DAY,

giving an accurate idea of its character and properties. The foliage and habit are precisely the same as in "The Flower of the Day." The truss is larger and bolder, and the pips are well shaped and of great substance. The colour is all that can be wished for, being a fine scarlet, vieing with even the most favourite green-leaf varieties, and is not subject to burn under the hottest sun, either under glass or out of doors. Notice will be given next season, when they are ready to be sent out. This is inserted to prevent other parties from adopting the same names.

Nursery, Hammersmith.

BARCHARD'S SEEDLING APPLE.—This beautiful Apple was raised from seed by Mr. Higgs, upwards of 20 years gardener to Mrs. Barchard, by whose kind permission he now begs to offer it to the Nobility and Gentry. It has been twice shown to Mr. Thompson, and also cut up at the Horticultural Society's Rooms, Regent Street, where it was highly approved of, and considered to be of first-rate quality; in proof of which Mr Thompson's opinion of it is given:—

"BARCHARD'S SEEDLING.—Fruit received from Joseph Barchard, Esq., in whose garden it was raised, and fruited for the first time in the present season. Fruit middle size, roundish oblong, obtusely angular; eye rather deeply sunken, surrounded with projecting folds; stalk short, not deeply inserted; skin dark shining red next the sun, streaked towards the shaded side, which is of a pale orange tinge; flesh yellowish white, tender, with a rich brisk sugary flavour. This sort is worthy of cultivation.—ROBERT THOMPSON, Sept. 22, 1852."

It is also described as first-rate quality in the Catalogue of New Fruit in the Horticultural Journal of October 1, 1853, vol. viii., where a full description of it is given. The whole of the stock is in the hands of Mr. Dancer, of the Fulham Nursery. Strong one-year old plants, 5*s.* each; extra strong plants, two years old, 7*s.* 6*d.* each.

All Post Office Orders directed to Mr. MATHEW HIGGS, Putney eath, payable on the Putney Post Office, will be promptly tended to, and good strong plants immediately forwarded.

HORTICULTURAL GARDENS, NORWICH.

Wellingtonia gigantea.

Plymouth Nursery, October 21.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
„ insignis, 2 to 7 feet
„ Menziesi, 3 to 7 feet
„ pinsapo, fine plants, 3 to 6 feet
„ Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
„ nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
„ Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
„ thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
„ chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
„ Irish, 4 to 10 feet
„ gold-striped, 1½ to 3 feet
„ do., tall standards, 4 to 7 ft.
„ Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
„ Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our nursery; they are removed every year, and will travel any distance with perfect safety. Of some, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

BATH NURSERY AND SEED ESTABLISHMENT.

JAMES GRIFFIN begs to announce that his annual importation of Hyacinths and other Dutch Bulbs have arrived in excellent condition, and comprise all the best and most useful varieties.

J. G. has an immense stock of all the choicest kinds of Pinks, at 6*s.*, 9*s.*, and 12*s.* per dozen pairs.

Antirrhinum Seed saved from a first-rate collection, 1*s.* per packet.

Weston Road, and 2, New Bond Street, Bath.

NEW PHLOX.

DREGHORN AND AITKIN, Nursery and Seedsmen, Kilmarnock, will send out immediately PHLOX BEAUTY of MILRIG, a pure white, with yellow eye, flowers extra large, smooth edge, fine, round, stiff petal, and a large trusser. It is considered by first-rate judges to be the best white out. Price 2*s.* 6*d.* each, with eight plants sent to the trade when six are ordered.

J. ANSELL begs to announce that his new and splendid Geranium "MARQUIS OF CAMDEN" will be ready to be sent out on the 1st of November next. It was exhibited at the Royal Botanic Gardens (at the June Show, 1854), where it was generally admired. Upper petals of a rich dark purple; lower petals, fine rosy purple, with a beautiful pure white centre. T. A. will be happy to receive orders for this most desirable variety, which will be executed according to priority of application. Price per Plant, 21*s.* Discount allowed where three Plants are taken.—Camden Nursery, Camden Town.—Oct. 21.

DUTCH FLOWER ROOTS.

JAMES CHARTRES AND Co., beg to inform their friends and purchasers generally, that they have imported a large and very choice stock of the above from the first houses in Holland, and the roots are remarkably fine this season, more especially Hyacinths. A Catalogue may be had on application.

J. C. and Co., beg further to state, that they can now offer the following:—

		s.	*d.*
True Perpetual Violets, in small pots, per doz. ...	6	0	
Neapolitan „ „ „ ...	6	0	
Linum trigynum, each	1	0	
Vallota purpurea „	1	6	
Strawberry Plants, British Queen, per 100	3	0	
„ „ Black Prince „	3	0	
„ „ Keene's Seedling „	3	0	
„ „ Elton Pine „	3	0	
„ „ Kitley's Goliah „	3	0	

N.B. No charge for packing.

Warehouse, 74, King William Street, City, and York Nursery, Hanger Lane, Stamford Hill, London.

CHATERS' SEEDLING PANSY, PICOTEE.

J. CHATER AND SON beg to announce that they intend sending out after the 20th October, their SEEDLING PANSY named PICOTEE, in strong plants, 5*s.* each. Pure white ground, beautifully edged with azure blue; eye large, fine form and substance. The margin of this flower resembles a fine Picotee.

Also Hollyhock Seed, from the best sorts, in packets containing 200 Seeds, 1*s.* 6*d.*; 400 Seeds, 2*s.* 6*d.*

Fine Plants of splendid Sweetwilliam, 1*s.* 6*d.* per dozen; 10*s.* per 100.

Choice Pansy Seed, 1*s.* to 2*s.* 6*d.* per packet.

A catalogue of the best Hollyhocks, Pansies, Roses, and Pinks, can be had on application to J. CHATER & SON, Nurseries, Haverhill, Suffolk.

JNO. AND CHS. LEE, Nursery and Seedsmen, Hammersmith.

EARLY MONARCH RHUBARB.—The earliest and best variety ever offered to the public.

J. F. Wood, Esq., F.H.S., Editor of the Midland Florist and Suburban Horticulturist, says—"I am highly delighted with the Early Monarch, and can confidently recommend it as the very best early Rhubarb grown. . . The foliage also is peculiar and very beautiful. . . For colour, size, and precocity, it is most assuredly worthy of very extensive cultivation; it is a decided acquisition."—Roots, 2*s.* 6*d.* each, or 24*s.* per dozen.

Also CRIMSON KING, very early, good size, fine flavour, and crimson colour, 5*s.* per root, or six for 24*s.*

Apply to JOHN BAILEY, Longton, Staffordshire.

WANTED, 100,000 HAWTHORN transplanted plants, of short stout growth, with fibrous roots.—Address proposals, with lowest price, including carriage to the nearest seaport, H. WALKER, Londonderry.

NOTICE TO PINE GROWERS, GARDENERS, OR THEIR EMPLOYERS, having PINES, or other GARDEN PRODUCE to dispose of during the winter and spring, are requested to apply immediately, or forward to

GEORGE TAYLOR, Jun., Fruit Salesman,
St. John's Market, Liverpool.

Terms—Nett Cash Payments.

TO BOTANISTS AND THE LOVERS OF WILD FLOWERS.

TO BE SOLD, the property of an eminent botanist, whose ground is taken for building purposes, a very choice Collection of Rare ALPINE and HERBACEOUS PLANTS, with a quantity of Rare and Interesting WILD FLOWERS, some FERNS and AQUATIC HARDY ORCHIDACEÆ, &c.—GEORGE TURNER, Botanist, East Barnet, Herts, 1½ mile from Colney Hatch Station, Great Northern Line.

DRIED PLANTS FOR SALE.

TO BE SOLD, a very valuable and extensive GENERAL HERBARIUM, partly arranged, and included in six neat, well made deal cabinets, adapted for the foundation or nucleus of a botanical collection, and suitable for any Public Museum or private collector who is beginning the pursuit. It is the property of a gentleman who had expended much money upon it, but who, having left England altogether, is willing to dispose of it at a small price. To save trouble, the lowest price that will be taken is 35*l.* The Plants are all in the best possible state, and include many of those sent home by recent travellers and botanical collectors.—Apply (in the first place), by letter only, to Mr. PAMPLIN, 45, Frith Street, Soho Square, London

Prices very moderate, as see Messrs. SUTTON'S Catalogue, which may be had, post free, in exchange for one penny stamp.—Address, JOHN SUTTON AND SONS, Seed Growers, Reading.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 21, 1854.

Now that the POTATO DISEASE is naturally disappearing, it is somewhat late to revive the enquiry into its cause, for it has become impossible to say whether the successful result of an experiment is due to the process employed, or is merely coincident with the general mitigation of the affection. We have, however, just received a Scotch pamphlet,* by Mr. DANIEL MACTAGGART, to which it seems desirable to direct the attention of those who are interested in the enquiry. The author of the pamphlet has two theories upon the subject; one that the Potato disease arises from the wearing out of varieties, or in other words from exhausted vitality; the other that the Potato disease is the cause of cholera. We must deal with the latter notion first.

It would be unjust to Mr. MACTAGGART if we attempted to explain his views of the connection between cholera and rotten Potatoes in any other words than his own. We therefore quote verbatim :—

"Potatoes damaged by frost, the sun, water, or worms, may be food for cattle, but when they are in a *natural* state of decay, I believe they contain poison of some kind or other, which causes the death of both man and beast. Typhus fever or cholera, has always visited Campbeltown at the time of a Potato disease, but they never came together; I have heard no reason assigned for this; but it may be possible, when Potatoes are dropping naturally to decay, that the eating of them at one stage of the process of decomposition may cause one disease, and at another stage, another; or what is equally possible, each variety of the Potato when dropping to decay, may contain matter for causing a disease peculiar to itself."

The evidence on which this strange theory rests is what happened to three Campbeltown fishermen, ANGUS, NEIL, and JOHN, while at sea. It seems that these poor men cooked some diseased Potatoes for supper, that the water in which the latter were boiled had "a strong sickening smell," which destroyed the appetite of JOHN, who therefore ate none, but that ANGUS and NEIL made a meal of them, and died in a few hours of cholera. This we say is all the positive evidence which the author produces; beyond that we have mere recollections and supposed coincidences between Potato disease and epidemics; thus we are told that in 1817 a number of people in Kintyre died of typhus; that the first appearance of curl in Potatoes was in 1815, and that they began to decay in 1818; that cholera broke out in 1832 in Campbeltown, and that the Potatoes there having lived their allotted time "dropped to decay in 1832 and 1833, and the last of them in 1834." But we need not pursue the subject; if the world cannot see the nullity of such arguments we should scarcely convince them. It is, however, worth a passing remark that while Mr. MACTAGGART connects Potato disease and cholera in 1832, he adds that the cholera lasted at that time only four months (which, by the way, were summer months, when Potatoes are little consumed); and although the Potato disease became worse and worse till 1834, two years afterwards, when the last of them "dropped to decay," yet during all those two years, people eating such Potatoes all the while, there was no cholera in Campbeltown.

It will be seen from what precedes that reasoning is not Mr. MACTAGGART'S forte; and our readers may wonder why we should thus notice a pamphlet containing such a crotchet. But we regard our author as a sensible man enough, except where he has a twist; and he has undoubtedly had experience in Potato growing. Let us therefore see what he says in support of his other theory, that Potatoes are diseased because they have lived their allotted time. This view is founded upon some curious statements. The author first relates how a Colonel PORTER of Knockbay, and a blacksmith at Drumalea, raised seedling Potatoes for many years. He then enters into computations of the time which the seedlings of these gentlemen remained healthy, or were supposed to be so; and finally states, in the following words, the conclusion at which he has arrived :—

"I cannot tell when the Irish Potatoes which Colonel Porter first planted at Knockbay came from the apple, nor do I know when the progeny of the seedlings reared by the Blacksmith dropped or will drop to decay, but I believe I have come very near the time when each of the Colonel's three different rearings was sown, and ceased to reproduce, and I shall therefore show how long I think they respectively lived. Each rearing took three years to drop *totally* to decay, but I shall take the year of the greatest blight; and thus it would appear the seed for each rearing was sown, and the progeny of the seedlings dropped to decay, and lived respectively as follows :—

According to the 7 years rotation,

1st Rearing sown 1801;	decayed 1832,	lived 31	yrs.
2nd Do.	do. 1808;	do. 1838,	do. 30	„
3rd Do.	do. 1815;	do. 1845,	do. 30	„

According to the 8 years rotation,

1st Rearing sown 1801;	decayed 1832,	lived 31	„
2nd Do.	do. 1809;	do. 1838,	do. 29	„
3rd Do.	do. 1817;	do. 1845,	do. 28	„
			179	

"By dividing this total of 179 years by six, which is the number of sowings in the two rotations, the result is that the average longevity of each rearing is twenty-nine years and ten months.

"The Pink eye is only one of the numerous varieties of the Potato, and in our present state of ignorance it is impossible to say whether it lives longer or shorter than any other variety, but taking it to be an average of the longevity of the Genus, I am inclined to think from the above calculation, that Potatoes after coming from the seed of the apple, will not continue annually to reproduce themselves in a sound and healthy state for thirty-one years. For a few years after they come from the apple they are unpalatable, but when they are made fit for eating by cultivation, I believe they will continue sound, healthy, and nutritious, until they are twenty-eight years of age. When they reach their twenty-fourth or twenty-fifth year, they become in some degree exhausted as if by reproduction, for they then begin to be less productive, but *after* they reach their twenty-eighth year, they appear to me to be in a state of decay, when the planting of them should be stopped altogether."

We thus learn that the life of a variety of the Potato is limited to an average of 28 years. What do English Potato-growers say to this? There is this merit in Mr. MACTAGGART'S case, that he is the first writer who has attempted to determine the point with precision; hitherto we have had nothing better than loose assertions that the sorts of Potato

* The Cause and Cure of the Potato Disease, with the particulars of his own experience since 1845 in rearing new seed Potatoes from the Apple. By DANIEL MACTAGGART, Campbeltown; M'EWING, pp. 47. 18mo.

wear out. To us the evidence on which he relies seems loose enough, and we own carries no conviction with it; rather the contrary. We fear, indeed, that the author is not accustomed to consider the value of statements; for we find him announcing, on the authority of Bishop Heber, that the Rice-feeding Hindoos live upon Potatoes! nor does such a paragraph as the following increase our confidence in his judgment:—

"In those parts of America where the Potato is indigenous, it requires to be planted and re-planted, and sometimes changed from one soil to another, before it becomes an esculent fit for man; and in this country it requires to be treated in the same way. The Potato, when it comes from the seed of the apple, is the natural food of worms and other creeping things; but by cultivation it becomes, in the course of a few years, a palatable and nutritious article of human food."

We undertake to say there is no sufficient warrant for the first part of this statement, and as for the last, we leave it to the appreciation of English gardeners.

On another subject we read some statements of Mr. Mactaggart with much interest, because they are founded upon facts within his own knowledge, and do not depend for their value upon calculations. We allude to the period when the Potato disease first manifested itself. We have long seen cause to suspect that the malady is not so new as in 1845 it was supposed to be; it is, indeed, hardly to be doubted that it has always existed, although in an inconsiderable degree. It was its prodigious intensity in 1845 and the following years that prevented its being recognised as the affection that had formerly been known in a milder form. Mr. Mactaggart now assures us that before the year 1798 we had occasionally in Kintyre the rot and blight. When the mischief was great and the tubers rotten to a great extent it was called the Rot; "but when the whole or a great part of the crop failed, it was called the Blight." The rot occasionally made its appearance in every Potato field in the district.

It will be seen from what we have said of Mr. Mactaggart's pamphlet, that our opinion concerning the effect of raising Potatoes from the apple remains unchanged. We know, and this gentleman's own statements entirely confirm the fact, that seedling Potatoes are as much diseased as their parents; we therefore decline to recognise the raising Potatoes from seed as a remedy. But we are, as we always have been, very far from discouraging the attempt to improve the quality of this esculent by seed-sowing. There never was a doubt that some varieties, even in 1845, resisted the disease better than others, the Irish Cups for instance; and a very little reflection showed, that by raising from seed there was a great probability that varieties of a still more robust constitution would be obtained. But beyond this we cannot go. Even the fact, just ascertained in the garden of the Horticultural Society, that all the seedlings raised by Mr. Anderson, of Fermoy, are free from disease, fails to shake our conviction, for very little disease this year prevails in any part of the neighbourhood of London.

Though mildew has been far less prevalent amongst Vines during the present season in England, even in those districts where it was last year so general and destructive that thousands of plants were left unpruned from a conviction of the inutility of wasting time and trouble upon a matter which offered no prospect of remuneration, another malady has proved most fatal, especially in the northern counties; and queries almost without number have, in consequence, been forwarded to us by the sufferers, respecting which we have on more than one occasion given information. We have now before us, in addition to this subsequent malady, a very singular case, presenting apparently an entirely new form of disease, and arising evidently from a minute parasite, but of such a character, as, we fear, forbids all hope of any material remedy. It made its appearance for the first time last year at Harewood, on a peculiarly healthy Vine, celebrated, as we know from more than one source, for its excellent fruit, and it is now making rapid progress again, under an aggravated form, to the destruction of the ripened fruit.

The plant itself is described as perfectly healthy in appearance, and the house, which is 62 feet long by 16 broad, and filled with the Vine, perfectly dry. The first indication of disease is a little brown speck; this increases gradually, forming an orbicular spot of a sienna brown, and preserving constantly a definite outline. This spot separates readily from the subjacent pulp, in consequence of a copious crop of mycelium, the threads of which form the radii of a circle, and traverse the more superficial cells, causing their partial decay. The surface of the spots, which ultimately occupy nearly the whole berry, sometimes from the extension of one patch, but more frequently from the confluence of more than one, is rough, with little raised orbicular reddish bodies arranged in concentric circles, and easily separating from the matrix, which is perforated for their protrusion. The outer surface of these bodies consists of delicate cells with a distinct darker nucleus; and when this is removed a lobed hymenium is seen within, rough with distinct sporophores, each of which is surmounted by an oblong spore, sometimes constricted in the centre, and occasionally so much so as to become pyriform, and varying in size from $\frac{1}{1700}$ to $\frac{1}{1500}$ of an inch. In age the perithecia fall away, leaving a little aperture, the border of which is often stained with black. The arrangement of the perithecia is exactly that of Oidium fructigenum, but the structure is altogether different.

The little parasite belongs to the genus Septoria, or at least to that division of it, when taken in a large sense, which bears unicellular spores. It may be characterised as

Septoria rufo-maculans, n. s., maculis orbicularibus rufis; perithecis emergentibus liberatis concoloribus; sporis oblongis simplicibus centro constrictis.

Unfortunately we can suggest no remedy, nor can we give any opinion as to what particular circumstances may have favoured the growth of the parasite. Our figure represents a diseased Grape of the natural size, to the right of which is a single perithecium

slightly magnified. The left hand figure represents a portion of the cuticle as seen from beneath, traversed by strong mycelium. The central figure at the base illustrates the mode in which the cellulo-fibrous hymenium, with its spores and sporophores, springs from the walls of the perithecium; while the upper central figure gives the more usual forms of the spores. In one of these there is a distinct nucleus, while in another the endochrome is retracted at either extremity. The three last are more or less highly magnified. *M. J. B.*

We read in the *Times* that after the late lamentable fire at Gateshead, Mr. Sampson Langdale, of Newcastle, agent to Ashton and Co., manure merchants and manufacturers, of London, produced an account of goods belonging to that firm in the warehouse at the time of the explosion. "They had 56 tons of ammoniacal charcoal, 10 tons of peat ash, *seventy-one tons of ochre*, and 200 empty bags. The charcoal had been used in London by the gas companies to purify their gas, and, in consequence of the ammonia it contained, became valuable for agricultural purposes. The charcoal mixed with sulphur and nitrate of soda, in his opinion, by the heat of the fire, would form an inflammable compound." May we enquire what sort of compound yellow ochre is likely to form in the warehouse of a manure merchant and manufacturer. If yellow ochre has any value as a manure it is a new discovery, with the exact nature of which we should be thankful to be made acquainted. The presence of more than seventy tons in the warehouse of one manufacturer indicates a very large consumption.

VEGETABLE PATHOLOGY.—No. XLII.

186. The greater portion, then, of the substance of plants is composed of carbon, hydrogen, oxygen, and nitrogen, with small proportions of sulphates and phosphates, to which are added in particular instances or in still smaller proportions other elements. These therefore must be present in the soil, conveyed to it or at least to the absorbing organs of the plant, or the plant cannot flourish, and either death or disease must ensue. If, however, phosphates and sulphates be present, the air is capable of supplying carbonic acid and nitrogen, though it does not follow as a necessary consequence, that the whole of the carbon and nitrogen which are appropriated by plants during the process of growth are derived from the air.

187. The nutriment of plants is imbibed mainly and under normal conditions by the spongelets, which consist of delicate tissue, and must therefore be dissolved in water, in order to its transmission from cell to cell. Now, though it is true that the atmosphere is capable of supplying the necessary quantities of carbon, in the form of carbonic acid and nitrogen, it is certain also that large quantities of both are generated by the decaying vegetable matters contained in the soil and by the animal manure conveyed to it; besides which both are brought from a distance by water rising from beneath, either from the decomposition of primitive rocks, or from organic matter which it has percolated and dissolved in the course of its passage. It seems, then, far wiser to admit that vegetables derive their nutriment from either source, than to restrict it to one, denying that the principal office of manure is to supply a greater abundance of necessary elements; while it is asserted on the contrary that its object is rather to collect and store up, as in a sponge, elements brought by the rain, which would otherwise pass through the soil as through a sieve. The quantity of carbonic acid contained in the pores is in general in direct proportion to the time which has elapsed since the manure was applied, and an immense quantity of nitrogen in the shape of ammonia is introduced by the same means.

188. That the whole nutriment of plants is not derived from the air is evident from the great difference of fertility of Cocoa Nuts under apparently similar circumstances, the produce in the one case being fifty-fold or more than in the other. Both are nourished by water, the sandy soil itself containing nothing soluble. In the one case, however, the subjacent water contains evidently more nutritive matter than the other, whereas both would be equally rich, supposing the quantity of rain to be the same, were the necessary elements derived from the air only. In those cases where crops grow uninterruptedly without any fresh manure, the soil either abounds in phosphates, as in many of the Hop-grounds about Maidstone, where it is needless to add more to the soil than the old bines, or it abounds in ulmates and humates in such a condition that they are capable of affording, year after year, sometimes for more than a century, the necessary supplies. In some forms which are insoluble in water and alcalies, as in peat, the soil without some artificial addition is incapable of supplying the wants of vegetation, and therefore remains sterile.

189. Ordinary soil, besides ulmin and humin, yields several allied matters which are readily soluble, as cienic acid, apocienic acid, geic acid, humic acid, and ulmic acid, and the more these abound in general the soil is more fertile, provided it contain the necessary phosphates and sulphates. Ulmic acid $C_{30}\ H_{14}\ O_{12}$ arises from the decay of vegetable matter, and absorbs oxygen from the atmosphere and becomes (humic acid $C_{40}\ H_{12}\ O_{12}$) + $_2$H O, which by the addition of still more oxygen becomes geic acid $C_{40}\ H_{12}\ O_{14}$. All of these combine with water, or water and ammonia, and therefore by their gradual decomposition supply carbonic acid and nitrogen, which are the grand essential for vegetable nutriment. The ulmin and humin, in consequence of the fermentation which is always going on in the soil, are gradually changed into ulmic and humic acid, and so become available. If they were too rapidly soluble, the solution would be too strong for the purposes of vegetation; and partly from this cause, and partly from the presence of a ferment in the shape of decomposing albumen or fibrine, or at least in a condition ready to undergo further change, the decay of one cell is rapidly communicated to another, ending in general decay, provided the supply of moisture, as in succulent fruit, is sufficient to keep up a rapid chemical action. *M. J. B.*

THE TIME WHEN PEARS SHOULD BE GATHERED. By M. De Jonghe, of Brussels.

Formerly, when the varieties of Pears in cultivation were comparatively few, there was little difficulty in knowing the time when each sort ought to be gathered; but now, when the number of good varieties is so much increased, the proper time for gathering the respective sorts cannot be known without a certain experience acquired during a period of from three to five years, in order that a mean may be obtained. For the maturity of the fruit on the tree depends:—

1. On the individual constitution of the tree, and its liability to change.
2. On the soil in which the tree is planted.
3. On the influence of the stock.
4. On the temperature of the season, whether more or less favourable for accelerating the maturity of the fruit.

In order to know exactly the mean period of maturity on the tree of any particular variety of fruit, it is necessary to observe several trees of such variety, planted in different soils and situations. With regard to the varieties of Pears which ripen at the end of summer, or early in autumn, it is not difficult to fix the date when they should be gathered; for, in the same situation, this, in different years, does not vary more than 10 days.

The influence of soil, of stocks, and of a temperature more or less warm and dry, is not so great on early fruits as on the late autumn, winter, and spring varieties. With regard to the summer and early autumn kinds, they cannot always be left to ripen completely on the tree, grown as a pyramid or standard; and it is needless to add that these sorts of fruits do not, in our climate, merit a wall, where, in fact they are never so good as in the open ground. When a considerable number of fruits is observed to have reached the point of maturity, and when, with a slight pressure of the thumb, the stalk is readily detached, without twisting, at its junction with the spur, a portion of the fruit should then be gathered, and allowed to acquire their full maturity in the fruit-room. This first gathering will ease the tree, and the whole of the nutritive sap

will be directed towards the remaining fruits, which, in consequence, become much finer; and these are gathered in the same manner, and successionally. The operation of successional gathering, called, in French gardening terms, *l'entrecueillement*, may be very advantageously followed up, because all the fruits on a tree never ripen simultaneously; and that they may acquire full perfection, it is important that they should be left on the tree to attain the necessary degree of maturity, known to the practised eye by certain signs, which it would be difficult to point out without entering into tedious details.

With regard to the late autumn, winter, and spring Pears, the same proceeding is adopted; it is only by successional gathering, *l'entrecueillement*, that we can hit upon the proper time, and know the happy medium between gathering too early or too late. The gathering of these fruits, in season as above mentioned, commences about the middle of September, and continues till the end of October, or till just before the fall of the leaves.

When some fruits, neither bruised nor pierced by insects, of a late variety of Pear begin to drop, although not affected by strong winds, nor by the continued drought which we sometimes experience in our climate towards the end of September; and when the leaves begin to turn yellow and fall from the tree, an attentive and experienced person will perceive that the period of gathering is close at hand. Whatever may be the influence of the phases of the moon with regard to the period of gathering, I have observed, for more than 20 years, that a great number of varieties gathered two or three days before the full moon in September, kept exceedingly well, without specking, in the fruit-room, where they acquired the full degree of perfection which the sorts respectively possess; whereas by leaving all the fruit on the tree, without having recourse to successional gathering, I have seen a great portion of it drop successively during the last quarter of the moon; and moreover the fruits, whether fallen or gathered late, did not keep well in the fruit-room, nor did they acquire their full flavour. I ought here to remark that these observations have been made with regard to trees grafted on Pear stocks, and cultivated in the open ground, in a light deep soil, but very rich with vegetable humus down to the subsoil, in consequence of frequently turning down the surface.

As above stated, the period of the maturity of the fruit on the tree, and likewise in the fruit-room, depends in a great measure on the soil in which the tree is planted; and the most delicious qualities of certain varieties of Pears are owing to the peculiar nature of the soil. The lighter, warmer, and drier the soil, the sooner the flow of sap ends, and the earlier the fruit indicates the necessity of partial gathering. But in case of a stiff cold soil it is the reverse. The first variety of soil will be favourable to one kind of Pear, whilst the second would be unfavourable, and *vice versâ*. But these details belong to a monograph on the cultivation of the principal kinds of Pears; which, it is hoped, will be completed some of these days, and it will prove very useful to young and inexperienced cultivators. In proof of this, I may be permitted to give an example, and it is taken from amongst many others. The variety of Pear called Nouveau Poiteau of Van Mons, is unquestionably one of great vigour, very hardy, and productive. Worked on the Pear stock, and trained *en pyramide*, it bears fruit as large and as handsome as the Duchesse d'Angoulême, Beurré Clairgeau, and Marie Louise. Cultivated on the Pear stock, or on the Quince, in a free light soil, with a more substantial and somewhat gravelly subsoil, this variety bears fruit which is melting, sugary, vinous, and slightly aromatic; whereas, if the tree is cultivated in a stiff cold soil, the fruit possesses none of these qualities. It is to be observed that the mean period of the maturity of this fruit takes place between the 10th and 25th of November, but without any change of its colour (an opaque green), to announce that such is the case.

The soil, as previously stated, exercises a great influence on the quality of the fruit, but more decidedly on the long-keeping sorts than on the autumn kinds. When a tree has been planted under favourable circumstances, and has acquired sufficient strength—when it is not overloaded with too heavy a crop, and consequently the fruits are enabled to attain their natural size, and likewise the proper degree of maturity, on the tree—it will then only ripen in the fruit-room at the normal period assigned to the variety, whether it may have been gathered in the end of September or in October. In September, before the full moon in this month, if the tree is in a light, deep, warm soil; and in October if the soil is strong, compact, and cold. All these circumstances require to be taken into consideration in order to know when to gather the fruit, so that it may keep in the fruit-room till its usual proper time for use.

It cannot be denied, and all practical men agree, that the stock has great influence, not only as regards the period of gathering the fruit, but also with respect to that of its ripening in the fruit-room. I knew a cultivator who raised stocks for budding with summer and autumn fruits, others for winter and spring varieties. With regard to the summer and autumn kinds, the nature of the stock is of little importance; but when long-keeping sorts are worked on wild Pear stocks, which stocks, if allowed to fruit, would produce summer Pears, it is certain that the period of ripening of late Pears worked on these stocks would be affected. I have seen some seedlings, planted in proper soil, produce fruit of which the medium time of ripening on their own roots had been fixed between December and February; but when grafted on summer or early ripening wild Pears, the ripening of the above varieties, grown in similar soil, was accelerated more than a month. Such irregularities do not result from propagations on the Quince stocks, because these are identically reproduced from layers. The importance of avoiding the unsuitable union of winter and summer fruits will be readily admitted: that is, the grafting of late ripening varieties of Pear trees on early ripening wild Pear stocks.

I am aware it will be objected that the purchaser would not take precautions on this point into consideration; that he only sees to the young trees having been once or twice properly cut or pruned; and that a certain number of such and such varieties required for his plantation is obtained. I understand these objections, because they do in reality exist. However, there are some intelligent amateurs who wish to obtain good articles on which they can depend, and are willing to pay a good price for them as a just remuneration to the producer.

Warm and early seasons accelerate the maturity of the fruit on the tree, but not in the fruit-room. After a good summer and warm autumn, Pears keep better, are always longer in becoming fit for use than when the season is otherwise, especially as regards the late sorts. After the warm summers of 1834, 1838, 1841, 1844, 1848, and 1850, the Passe Colmar and Beurré d'Hardenpont [Glout Morceau], although gathered in the end of September, kept till the end of December and January; the Beurré Rance, from January till April and June.

In conclusion, from what has been stated, it results that the same kind of fruit cannot be gathered uniformly at the same date, owing to various circumstances which influence the ripening; that by successional gatherings, or at intervals, the proper time for different localities is best ascertained; and that, in general, all the varieties ought to be gathered before their perfect maturity, which should be attained in the fruit room.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

(*Continued from p.* 662.)

Section D: Zoology and Botany.—Mr. Warington read some further memoranda of observations made in small Aquaria, in which the balance between the animal and vegetable organisms was permanently maintained. The first series of memoranda related to experiments made in a fresh-water aquarium. As an evidence of the permanency of the balance capable of being established between the animal and vegetable organisms by the introduction of the water-snail or other phytophagous Mollusca, he stated that the same water in which his original experiments were made in March, 1849, has been in constant use up to the present time, several fish living constantly in it without disturbance, and that it is now as bright and in as healthy a state as at the first period of its being employed. Again, in a small jar of about a pint capacity, having a single plant of Vallisneria spiralis growing healthily in it, and with a few small water-snails as scavengers, he had succeeded in hatching and rearing a young trout. When the fish was able to swim strongly it was transferred to a small aquarium, containing several minnows, when, to his great annoyance, it was immediately seized and devoured. Care should be taken in the aquarium for fresh water to exclude the corum, or fresh water polype (Hydra fusca), particularly where certain species of fish are to be preserved, as the minnow (Leuciscus phoxinus); for these creatures, insignificant as they appear, after a short time cause their death, and that under most extraordinary circumstances. His own impression as to the mode in which this destruction of life was brought about was that the hydras, whenever their extended tentacula were touched by the swimming fish, seized on them, stinging them, and thus causing a great degree of irritation. The polypes also were torn from their position by the greater strength of the fish and carried to their places of retreat, where, in consequence, the mischief was continually accumulating. The next series of memoranda had reference to the author's observations made in sea water aquaria, and were in continuation of those read at the meeting of the Section on Thursday last. He had had progressing very successfully for some time past an experiment with a view to preserving sea water in a perfectly transparent and healthy state without the use of vegetation of any kind, or in some cases even without the use of a scavenging mollusc. The manner in which sea water under such circumstances might be kept in a healthy state was by exposing a very extended surface of it to the action of the air, and at the same time limiting its depth. He described the arrangement which he had adopted for upwards of twelve months. By that arrangement a very extensive surface of water was submitted to the oxydising influence of the air, and the fish and crabs, by their continual movements, cause sufficient motion in the fluid to expose a fresh surface to its action, and thus keep up its aeration. But it must be borne in mind that the oxygenation of the water thus effected was a very delicate equilibrium, and the maintaining a healthy aeration was liable to be disturbed by very slight interfering causes; nor did he conceive that this method would be applicable, except to such marine denizens as are either of such low organisation as to require but little aeration of the water, or to such as the crab tribe and those creatures which delight in being in shallow water, or have the power of climbing out of their liquid element. The form of the aquarium which he had now, after upwards of five years' experience and observation of the natural habits of the various animated tenants, adopted, consisted in a four-sided vessel, having the back gradually sloping upwards from the bottom, at an angle of 45° to 50°, and the consequently widened top sloping slightly downwards, and resting on the upper part of the back. The bottom therefore became necessarily narrow. The front, for the purpose of observation, and the top for the admission of light, were to be of glass, the back, ends, and bottom being constructed of slate; the whole fixed in a stout framework. The sloping back was covered with light rockwork, extending to a short distance above the water line.—Mr. Patterson described a plan of creating Aquavivaria adopted by Dr. Ball, of Dublin, which had been perfectly successful. It consisted of a blowing apparatus, by which air was introduced by gutta-percha tubes into the bottom of the tank, by means of a common pair of bellows.

THE MIRBELIA.

Most of the species of this genus are of a nice compact habit of growth, forming handsome specimens, and their pretty little flowers are produced very freely; hence they are well worthy of a place in the most select collections. Some of them are, however, rather difficult subjects to manage; but if proper care is exercised from the first, so as to avoid letting them get into a sickly state, they will be found to grow freely enough. Short jointed bits of the young wood selected in a rather firm state, and treated in the ordinary manner, root with tolerable certainty, and young plants are readily obtained from seeds. But well-propagated plants may be obtained for a trifle, and it is hardly worth while for beginners to attempt their propagation, which requires some time and careful attention if good young plants are to be produced. I will suppose that young plants are procured between now and March, and every care should be exercised to select healthy strong young samples with a bushy habit of growth, for future success will largely depend upon obtaining vigorous well-propagated plants.

About the beginning of March turn them carefully out of their pots, and if the balls are found to be well covered with healthy roots, shift into pots a convenient size larger, placing them after repotting near the glass in the warmest end of the greenhouse, or in a pit which can be kept rather close. Sprinkle the plants over head on the afternoons of bright days, shutting up with a temperature by sun heat of 55° or 60°, and endeavour to maintain a nice moist growing atmosphere, giving air freely on mild days, but guard against cold cutting winds. Also avoid as much as possible the use of fire heat, and endeavour to coax the plants into early growth by carefully husbanding the sun's influences; for unless the temperature is proportioned to the amount of light they will break thinly, and make weakly growth. Indeed, the temperature should never exceed 45° by means of fire heat, and this should be accompanied by plenty of moisture. The shoots, if there are several to a plant, should be nicely tied out after potting, in order to prevent the flow of the sap to the uppermost buds, and induce them to break close and regularly. Very little water will be needed at the root for some time after shifting, and this must be administered very carefully at all times, as the plants are very impatient of stagnant moisture at the root, and soon suffer from any neglect in this respect; but while in free growth they must not be allowed to suffer from the opposite extreme.

As soon as the weather becomes mild, remove the plants to a cold frame, which will form the best and most convenient situation for them in summer. Here they should be afforded a free circulation of air on favourable occasions, and a slight shade against bright sunshine, keeping the atmosphere as moist as can conveniently be done. Sprinkle the plants over head early on the afternoons of fine days, and shut the lights down for the evening, but give air before retiring for the night, and after about the middle of July the lights may be thrown off at night when there is no danger of rain. As they advance in growth attend carefully to regulating the shoots, pinching out the point of any one that may incline to take a decided lead of the others, and keeping them nicely tied out. If all goes on well a second shift will probably be necessary towards the middle of June, and this should be given as soon as it may be wanted, in order to get the plants pretty well rooted into the fresh soil before winter. When the weather becomes cloudy and damp in autumn discontinue the use of the syringe and shading, and keep the plants rather dry and airy, in order to get the wood well ripened, and remove them to their winter quarters, which should be a light airy part of the greenhouse, before there is any danger of their suffering from damp or cold. In winter, and while in a dormant state, keep them rather dry at root, and guard them from cold winds, but give plenty of air on mild days. To obtain specimens of any size it will be necessary to afford them another season's growth, and in this case the shoots should be cut back as much as may appear requisite to ensure a close bushy habit of growth, and the plants placed in growing circumstances early in spring, treating them during the season as already recommended. But if the plants are to be allowed to bloom, they should be left in the greenhouse until the flowers open, and may then be removed to a cool airy part of the conservatory, carefully shading them from bright sunshine, to prolong the beauty of the flowers. After flowering, cut the shoots back to keep the specimens compact and bushy, and place them where they can be afforded a cool moist atmosphere until the buds start into growth; then give a moderate shift if

necessary, and treat them during the growing season as nearly as possible as recommended for young plants; for free growth need hardly be expected without the assistance of a moist, rather close atmosphere.

For soil, use the very best fibry peat that can be obtained, breaking it up into small lumpy bits, and adding a liberal proportion of sharp silver sand, with a small quantity of lumpy bits of charcoal or clean potsherds. Well intermix the whole together, so as to provide for the free percolation of water through the ball after the decay of the fibre; and in potting care should be used to provide perfect drainage. *Alpha.*

Home Correspondence.

Profits of Pear growing.—If your correspondent, S. B., of Bromley, had taken the trouble to examine your weekly report of Covent Garden Market, he would not have fallen into the serious error he has, in estimating the profits of "Pear growing." He would then have seen that the growers, in a general way, sell their fruit by measure, and not by so much each, as he calculates on. Now, having supplied the metropolitan markets during the present season with something like a hundred sieves or more, I feel constrained to say, that as a remunerative crop Pears are much inferior to small fruits, and I would feel greatly obliged by any instructions that might be given by any one, which would be the means of making my trees more fruitful. Of the present season I cannot complain, neither was last year a bad one, but there have been seasons in which I have not had more than a tithe of the fruit I have this year, and from the same trees too. Observe, I ask for instructions of an economical kind, and not any expensive system of pruning, or covering up at nights while in blossom; I do not want to be put to an expense of 4*s.* for a sieve of fruit which I may be obliged to sell for 3*s.* 6*d.*, for I would rather endure the character of "a bad manager," which I see rather too freely applied to us fruit-growers, than incur an outlay beyond the worth of the article produced. At the same time, I am open to conviction on many points, but I really cannot see anything in your reports of M. de Jonghe's practice that is likely to be available to us. I have been a fruit-grower long, and have tried various experiments, but few of them have withstood the test of practice, although I confess now and then to have rode my hobby very hard, and done all that could be done to make it succeed. Some 30 years ago, or nearly, there was a proposal before the world for making Pears more prolific by grafting them in a reverse way, and some well shaped wall trees were rendered ludicrous objects by the system; afterwards we were told to try miniature orchards, *i.e.*, trees cut away into the most minute forms; subsequently we had all manner of fantastic training urged upon us, and some 10 years ago some one claimed credit for advising "root pruning" as an antidote to barrenness, until others attempted to show that the system was as old as the hills; while a few years ago, pruning in a conical form was recommended by one of our first authorities in fruit culture. Now having given all the plans a trial (and that not in a small way) and many others, I have come to the conclusion that the failures we have in Pears, arise in most cases from causes over which we have no control; and that although we may, by judicious management, now and then successfully oppose these causes, yet by far the greater part is insurmountable; and to be taunted with being unable to compete with our Belgian or Channel Island neighbours, in the quality of our fruit, is nearly as idle as to be upbraided by the Chinaman for not growing tea as well in England as is done in the Celestial empire. The two cases differ only in degree; but I have already said enough, and will be obliged by "S. B.," or any other person, pointing out a way whereby I may, with something like a certainty, look for 10 sieves of fruit next year from a tree which has produced me eight this, and that at a cost not to exceed the value of the two extra sieves. This is the way in which we fruit-growers, who pay heavy rents for our ground, &c., are compelled to look at these matters; and any other mode must be useless, at least as far as the million is concerned. *H. T. H., Staplehurst.* [There is no doubt about that.]

Eyebright.—Having a field overrun with red Eyebright (Odontites rubra), perhaps some of your correspondents will kindly inform me how to get rid of it. *Subscriber.*

Mosquitoes and worse Insects.—Still unable to find my authority for the "sawdust of Juniper wood," the Artemisia, recommended by Dr. Hooker, and the Rue, by another correspondent, have frequently occurred to me as remedies for another pest still more complained of by travellers. It is an old saying that neither fleas nor bugs will bite where there is a sprig of Wormwood or Rue in the bed: and, although these herbs may not be procurable when most wanted, they both furnish a powerful essential oil, of which a half pint (or smaller) bottle, wrapped round with a yard or so of folded muslin, and packed in a tin box, might form a part of the traveller's equipage. Opening this box, putting a few drops of the oil in the muslin, and squeezing it well to diffuse the oil all through it, and spreading this cloth between the sheets an hour before going into bed, the insects might be effectually quieted, if not expelled, so long as the odour remains, which would be the whole night. The same cloth would serve repeatedly, and form a safe package for the bottle. But another essential oil, having an odour like Juniper mixed with Wormwood, but more powerful—that of turpentine, may be obtained almost wherever paint is used, is very cheap, and known to be extremely repugnant to bugs, and therefore, probably, to fleas. This may be used in the same manner, and may procure the traveller a good night's rest, when he would otherwise be driven from his couch. *J. Prideaux.*

Sulphur evaporated from Hot Pipes, or Flues versus *Mildew.*—I am glad to find that your correspondent "D. S." of Woodbridge, has succeeded in securing an excellent crop of Grapes free from mildew by the above method, which was pointed out by me in your volume for 1853. Additional proof of the value of the plan has come under my notice during the present season, and I am happy to say that in no instance has it failed, although in some cases the Vines have been dreadfully affected, as, for example, in a Vinery belonging to J. Freeman, Esq., Gaines, near Worcester; this was certainly the worst affected house I have ever witnessed, and to all appearance impossible to cure. The foliage was entirely covered with mildew, and the young wood also, while the berries would fall off with the slightest shake of the bunch. A cure was, however, attempted by myself and the gardener, Mr. Hall, and in the course of four succeeding operations the mildew entirely disappeared; and on a recent visit to the place, I confess I was surprised to see the excellent condition into which the Vines had got; with the exception of a few marks left on berries of the Muscat and white Nice, no one could possibly detect the slightest trace of mildew; the luxuriance of the foliage and the weight of the bunches, which I was informed by Mr. Hall exceeded 6 lb., all indicated the Vines to be in first-rate health. A late Vinery at the same place was likewise very badly affected, but it was also entirely cured by the same process. I am now fully convinced that the best remedy for mildew is sulphur mixed with water applied to the flues or pipes by means of a brush, when they are sufficiently hot to vitalise it. This is not only a cure for but also a preventive both of mildew and red spider. The pipes or flues should be dressed over with the mixture every fortnight during the forcing season, and to late Vineries fires should occasionally also be lighted for the same purpose. *E. Bennett, Perdiswell Hall, Worcester.*

Barking Oak Trees.—I sell a few tons of bark generally every year, and it has been always my custom to fell the trees and then bark them. Last spring, however, I left one or two standing, as it appeared to me that there was good reason for trying the experiment. I apprehend that when we commence barking the trees are full of sap; whereas, if the trees are felled in the winter, they are free from sap, and therefore, I conceive, better able to resist moisture. No one thinks of felling Elm timber so late in the season as the time of barking. An Elm, if cut late in the spring, and after it has been lopped of its branches and hauled to the wood-yard, will, as summer advances, throw out buds and leaves all over its trunk. It must therefore be saturated with sappy juice, and, to say the least, would require much longer time to get dry and well seasoned than timber felled in a state of wintry lifelessness, drained of all its vegetable moisture. If it is right to fell Oaks at barking time, it would seem to follow that all other deciduous trees should be felled at the same time. Now as the Oak felled under the most disadvantageous circumstances will nevertheless last as timber longer than is convenient for making experiments, I would suggest that a tree more prone to decay should be selected—for instance the Elm—for instituting comparisons. Let two Elms of equal size and vigour be selected; fell one of them at Christmas and the other in June; cut them into planks or posts, and take note which timber lasts the longest—that thrown in winter or in summer. I would, however, ask you whether you think it possible the sap of the Oak contains some conservative ingredient antagonistic to decay? I should suppose not, but I am at a loss otherwise to conceive why the practice of felling Oaks in spring should be defended, and that of felling Elms in winter scrupulously adhered to. There is no doubt that it is an additional expense and trouble to bark trees whilst standing. *E.* [On former occasions we have pointed out the inferior quality imparted to Oak timber, in consequence of the practice of spring-felling. The latter has, no doubt, arisen in consequence of the value of Oak-bark; to save the bark the timber is injured.]——At your request, I venture to give the plan we have adopted for upwards of forty years in the management of Oak timber and its bark. We cut down and peel all the smaller trees at once, leaving them on the spot until the winter following—this prevents cracking. The large timber we prefer working upon standing, allowing some branches to remain on for the leaves to push out again; this plan hardens the wood and gets rid of the sap, being convinced from long experience that it is of advantage to the timber to be winter cut, when deprived of its juices; using this caution, that, should the tree die in the summer from such treatment, it must not be neglected the following winter; for, if left standing dead, the capillary attraction is so strong from the wet ground underneath as to cause rapid decay and induce dry-rot hereafter. This I named in a former communication upon the treatment of Larch timber. The low price of bark has, of late years, made it necessary to economise to the utmost its preparation, more particularly in a part of the country where wages are comparatively high, and from the non-employment of women, who cannot be had, work averages still higher in competition with other localities. I have found great difficulty in confining the men to peel the boles alone; in small wood such branches, from the thinness of the bark, will not pay taking off. We always make parks, as we call them, constructed from the smaller straight poles, kept up from the ground by forked boughs, the bark first laid crossways thereon, and thatched over with the largest selected flakes taken off. *C. P., of York.*

Societies.

Horticultural, *Oct.* 17.—The following subjects of exhibition received prizes, although no meeting was held. A very beautiful set of Orchids from Mr. Carson, gr. to W. F. G. Farmer, Esq., had a Large Silver Medal awarded them. They consisted of Calanthe masuca, the Blue Vanda (V. cærulea) with a magnificent spike of lovely blossoms; an admirable specimen of the best variety of Odontoglossum grande; Miltonia candida, equally well grown and flowered; the purple M. Moreli; Cattleya bicolor, a beautiful species, more especially when its colours are well brought out, as in this instance; Rodriguezia coccinea, a rather better variety than secunda; and an example of the larger flowered variety of the charming Epidendrum vitellinum. Mr. Burn, gr. to the Marquis of Aylesbury, received a Banksian Medal for the following Pine Apples, viz., two Providence weighing respectively 9 lb. 10 oz. and 8 lb. 13 oz.; a Cayenne weighing 4 lb. 5 oz.; and a Montserrat weighing 4 lbs. 12 oz. A similar award was made to Mr. Black, market gardener, Turnmoss, Stretford, near Manchester, for six Montserrat Pines, all handsome specimens, and beautifully ripened. They weighed respectively 4 lb. 6 oz, 4 lb. 5 oz., 4 lb. 4 oz., 4 lb. 3 oz., 4 lb., and 3 lb. 15 oz. The same grower also furnished six very good bunches of Muscat Grapes, which, however, did not appear to be ripe.

Entomological, *October* 2.—The President in the chair. Donations were announced from the Royal Society, the Society of Arts, the Royal Society of Belgium, the Natural History Society of Lyons, Messrs. Guerin-Meneville, Perroud, Bach, Koch, Zuchhold, &c. Mr. F. Smith presented a series of specimens illustrating six different species of British ants. Mr. Walkeys sent a specimen of a Larch twig, showing the gnawings of wasps, which had evidently used the particles in the construction of their nests. Mr. Samuel Stevens exhibited specimens of the very rare Goniodoma auroguttella, one of the most beautiful species of Tineidæ, captured in the Isle of Wight; also a fine variety of Apatura Iris, taken near Rochester; an hermaphrodite Thecla Quercus, captured by Mr. Weaver in Scotland; and specimens of a new species of Scolytus which attacks Birch trees in Scotland, larger and distinct from the Elm-destroying species. Specimens of various rare lepidoptera, captured by Mr. Foxcroft in Scotland, were also exhibited. Mr. Douglas exhibited a new British species of Crambus, hitherto known only as a native of Italy; also a new Nepticula, reared in Scotland, by Mr. Weaver, from the Vaccinium Vitis idea; and a specimen of the rare beetle, Dictyopterus minutus, taken at Haddington in the middle of September. Mr. Stainton exhibited a number of leaves of the Oak, Rose, Buckthorn, Whitethorn, &c., infested with the larvæ of various species of Nepticulæ, likewise leaves of Hawthorn, with the mining larvæ of a minute weevil, Ramphus pulicarius. Mr. Westwood gave a short notice of some jumping seeds forwarded to him by Sir W. J. Hooker, which had been received from Mexico, the motions of which were caused by larvæ inclosed within the seeds. The Secretary read a notice relative to the introduction and successful rearing of the Indian Eria silk-worm into Malta; and also a translation of a memoir by Professor Zeller, on the curious habits of the Grapholitha corollana, a small moth, which might be expected to be found in this country now that its habits were known. Mr. Stainton also read a memoir on the habits of the larvæ of the genus Elachista, belonging to the mining Tineidæ, including a notice of a memoir by Mons. Riville, on a singular species found upon the Vine, agreeing in its habits with one found by Mr. Stainton on the Dogwood.

Reviews.

Duncan's History of Russia (2 vols. 8vo. Ingram) is well timed, and deserves an extensive circulation. It consists in part of a translation from the Russian of Rabbe, and in part of original matter by the author. Just now, when all the world is wondering how the Russian empire ever arrived at its monstrous size without acquiring strength in any proportion to its vastness, the details in Mr. Duncan's work are peculiarly interesting; perhaps the thoughtful reader will arise from its perusal with a belief that the catastrophe which now seems impending is the judgment of God upon what was certainly the most atrocious of all governments, until the advent of the present sovereign and his predecessor introduced a better order of things. We cannot notice at greater length a work so foreign to our columns; except to extract the following account of the Russian circulating medium, which is, we dare say, as new to our readers as it was to us:—

"For want of gold and silver money, not yet known to the Russians, they employed other representative signs. The first was the skin of the marten (*kouna*), which was not the sable of Siberia, that country not being yet discovered. There were 20 kounas, or skins of martens, in the grifna. The vekokhe, another kind of money, was made out of the skin of squirrels; there were 20 of these to each kouna, or skin of a marten. It seems also that four rezans made one vekokhe. This word is derived from *rezat*, "to cut,"

and appears to be the fourth part of a skin. Ears and half-ears served for petty cash. The fourth part of a copeck, the Russian halfpenny, is still called polouchko, or half-ear. They also use the lobki, which was skin from the forehead of a squirrel; and the mordki, which was taken from the nose of the marten. The inconveniences of this kind of money, which depreciated through wear and tear in circulation, so as in time to lose all its value, compelled the Russians to replace it, towards the end of the 14th century, by pieces of leather stamped with a certain sign. However, the most interesting remark to be made on this practice, apparently so singular, is, that it was derived from the nature of then existing property, which, among all peoples, has at their origin formed the principal and indeed sole source of wealth, that is to say, flocks and herds. Southern nations used domestic living animals as instruments of exchange; the northern nations, skins and wild beasts."

If newspapers are to be believed, the age of symbolic money in Russia is about to return.

Praktische Studien, &c. [*Practical Studies of the Family of Orchids, &c.*] By J. G. Beer. Vienna, Gerold. 8vo., pp. 332.

Mr. Beer seems to be one of those lovers of orchids, or orchidophilists as some one calls them, who are now appearing among the wealthy Germans, and who bid fair to render the cultivation of those curious plants as universal on the continent as among ourselves. The object of the writer is to point out such circumstances in the habits of the race as his experience teaches him to be important, to explain their peculiarities genus by genus, and to offer a horticultural classification of the whole of them in gardens. The result is a very handsome volume, which we have no doubt will be found acceptable to the author's countrymen. The work does not pretend to be one of science, and we therefore do not feel called upon to criticise it in that point of view; but we may say that even the systematical writer may gather information regarding foreign synonyms from the pages of Mr. Beer. At the end of the work is a catalogue of the species described in it, among which we find many that are not cultivated in this country, as far as we have seen.

New Plants.

95. Whitlavia grandiflora. *Harvey in the London Journal of Botany, vol. v. t.* 11. *Bot. Mag., t.* 4813.

A specimen of this fine plant was exhibited last summer at Chiswick by Messrs. Veitch, and it is certainly the gem of the season in the class of hardy annuals. It will no

doubt be as hardy as a Phacelia or Eutoca, the latter of which it resembles in its foliage, but then its brilliant blue flowers are as large as those of a Campanula, and much finer than anything else of the kind. Mr. W. Lobb found it in California on the mountains of S. Barnardino; but it was originally discovered in that country by the late Dr. Coulter. Dr. Harvey, who first described the plant, naming it after Francis Whitla, Esq., distinguished two supposed species, *grandiflora* and *minor;* but we entertain no doubt that they are, we do not say varieties, but states of the same plant. We had both of them in flower on our table from Messrs. Veitch, at the same time. The fact seems to be that the plant when in great health is *grandiflora*, and when weak, from a shady place, is *minor*. Dr. Harvey thought they might differ in the form of the scales which stand at the base of the stamens; but we found those scales varying in form from being acutely bifid to being entire and wedge-shaped with the angles rounded off.

96. Diotostemon Hookeri, *Salm-Dyck in Allgem. Gart. Zeit. Aug.* 26, 1854.

A plant sent to the Prince of Salm-Dyck some years since, and said to constitute a new genus near Echeveria (and Pachyphytum, which is also an Echeveria). Its chief peculiarity seems to consist in the presence of a pair of ear-like appendages upon the filaments. It is described as a succulent shrub, from Mexico, with dense semi-cylindrical hoary or frosted leaves, and one-sided racemes of long-stalked, yellowish-red stalked flowers.

Garden Memoranda.

Messrs. Henderson's Nursery, Pine-apple Place, Edgeware Road.—The most conspicuous objects in the show-house at present are examples of Salvia splendens, which when well managed is nearly as brilliant and useful on the greenhouse stage in winter as Scarlet Geraniums are in the parterre in summer. They were intermixed with plants of Salvia cærulea, whose bright blue blossoms form a good contrast with those of the scarlet kind. White and Blue Ageratums were also in flower here, as were likewise a few Heaths and Pelargoniums. These must, however, soon give place to Chrysanthemums, the smaller flowered kinds of which are now coming fast into blossom.

In what is called the span-roofed New Holland House was a very fine specimen of a Veronica named hybrida, a continental kind with handsome spikes of purple and white flowers, in the way of Andersoni, while the foliage is small, like that of Lindleyana. It is stated to be a rapid grower, and must certainly be acknowledged to be a fine variety. Of other plants we remarked here several little bushes of Beaufortia purpurea, each shoot of which terminated in a globular head of brilliant purplish red blossoms, which render this seldom-seen plant well deserving of far more attention than it has hitherto received. It lasts a very long time in flower, and is especially well suited for persons who have but limited house-room, as it blossoms freely in a very small state.

The heathery is at present filled with Chrysanthemums, which promise soon to be extremely gay. On the roof of this house Mandevilla suaveolens has grown and flowered beautifully this summer; and a small plant of Lapageria rosea, against one of the end walls, is now producing two or three of its rich red bell-shaped blossoms. It appears to be a plant that will keep a long time in flower; for no sooner do the first developed blooms begin to fade than others open, and supply the deficiency: as yet, however, enough of them has not been expanded at one time to render the plant very gay or striking at a distance.

In the specimen house, which contains many finely grown plants, the Java Rhododendron was in flower, as was also a standard Acacia called Oleafolia elegans. This naturally comes into blossom about this time, and, being of a drooping habit, looks well as a standard. It lasts long in flower. The most brilliant plant in this house, however, was Gardoquia Hookeri, in the form of a specimen measuring nearly 2 feet across and 18 inches in height, and literally studded with scarlet flowers. Indeed, we know of no greenhouse autumn-flowering plant more showy than this Gardoquia, which, under good management, may be had in blossom from July to Christmas. Croweas, in the shape of standards, were in flower here; and, grown in this way, they form pretty objects placed on flat front shelves among smaller plants. The pale blue Pronaya salicifolia we also found in blossom; it is a plant of neater growth than P. elegans, which was in flower in another house.

The plant, however, which will doubtless command most attention at the present time here is Nerine Fothergilli, several examples of which are now beautifully in blossom, its brilliant scarlet heads just appearing above the other plants with which they are associated. This is very much gayer than the Guernsey Lily, and, unlike that plant, it, *i.e.* the same bulbs, if well treated, will flower freely every year, and the older they are the finer they bloom; so that the annual expense of purchasing bulbs, as in the case of the Guernsey Lily, is saved. As regards treatment, when they have done flowering, they should be encouraged to grow and perfect their foliage; as the latter decays, water should be gradually withheld until the leaves have completely died down, when the bulbs should be rested in a dry state all the summer; next autumn they should be repotted and encouraged to grow again, and in this way this truly beautiful winter flowering plant may be had in blossom year after year with little or no trouble or expense, and with no more heat than that supplied by a common greenhouse, or even a cold pit or frame.

A new stove and intermediate house have been lately erected here. The latter has been found to be the most suitable place for such plants as Babingtonias, Croweas, Boronias, especially serrulata; Gnaphalium eximium, Gardoquias, Chironias, Luculias, and the Java Rhododendron, as well as for bringing plants gradually on for forcing. In the stove a beautiful specimen of Lantana alba grandiflora was just coming into bloom, as was also the pink Hibiscus pedunculatus, and the white-blossomed Rhodostoma gardenioides. Ixora crocata was in full blossom, and a most useful plant it is at this season, as are also Siphocampylus coccineus, and S. glandulosus magnificus, Statice Holfordi and the Showy Æschynanth (Æ. speciosus). The first lot of Amaryllises has just been placed in this house to start them into growth. These are intended to flower about Christmas. Others to blossom later, will be introduced at intervals, so as to maintain a succession of flowers all the winter.

Out of doors Japan Lilies have, until last week or so, been beautifully in flower, as have also been Tritoma uvaria; both are, however, now very much past their best. The pretty little Sikkim Rhododendron ciliatum is also standing out of doors in pots, well set with buds, which, if the plants be put into heat, will open beautifully by about Christmas; and what, at that season, could possibly be gayer? Though quite hardy, it well deserves a place under glass.

It is but right to add, that the Messrs. Henderson have recently devoted an excellent library, consisting of some 700 volumes, to the use of the men in their employment; the books are permitted to be taken to their respective homes to be read,—a plan, we understand, which has given general satisfaction.

FLORICULTURE.

Cinerarias.—Plants received from the nursery, either last month or this, will be in good condition in 3 and 5-inch pots. They are wintered here in pits or frames well secured, so as to exclude frost. The glass is well covered with mats and straw, but no artificial heat is applied. Thus treated they are always strong and robust; but many grow them in houses, and I think that for a month or so, about January, it would be of service to them to be in a cold house, or a pit heated with pipes, so as to ward off damp, while a long continuance of frost prevails, otherwise a pit is the best place for them, and they can be brought into the house at various seasons, so as to prolong their period of flowering; indeed, by judicious management, they may be had in blossom from November till June. When wintered in pits they will require to be well watched, so as to give air every day to dry up damp. If this is not attended to the leaves will "fog off." At the present time, when they are growing rapidly, they should not have the lights taken off, except when the air is mild and not drying; but let them be tilted on the side contrary to the direction in which the wind is blowing. If the lights are altogether removed their growth is retarded, as they dislike dry easterly winds as much as we do; but a moist air will not harm them. A slight warm shower is always beneficial to them when the weather is such as to permit them to receive it. Never let them become pot-bound; directly this is the case, green fly attacks them, the leaves get pale, and the plant starts for bloom prematurely. If grown in a house, they should never be allowed to have a cold dry air playing amongst the leaves; they delight in moisture while they are in a growing state. When they have finished blooming, about an inch of the surface soil should be removed, and fresh material placed all round the plant, which should be kept in a shady part of the garden. Where a quantity is wanted, plant out in light soil, in some situation shaded from the mid-day sun; or, if you possess only one plant, perhaps a choice seedling, and you wish to be more particular over it than usual, keep it in a pot in a frame, so that you can protect it from wet, when required. Those in pots must not receive much water; indeed, directly the flower is going off, watering should be carefully performed, or the plants may die; or the roots, from which your young stock is to be produced, are injured. Permit the stem to gradually die away, and remove the leaves as they wither off, cutting the flower away only. This applies more particularly to some varieties than to others, as many grow freely and produce plenty of stock without this extra care. Never keep old plants to bloom the following season, they seldom produce such fine flowers, and they are more subject to insects and diseases. Let your slips be quite small and young, cutting down into the earth where the stem is blanched; these will strike root quickly. Place them round a pot prepared in the usual way, *i.e.* half crocks; on these some siftings, to prevent the soil from running through the drainage, then the soil as used for the plants, except that it should be finer sifted and should have more sand mixed with it, and the surface should be white sand, in order to prevent the cutting from damping off; place the pots under a common handlight or in a close frame, airing a little now and then, to dry up over abundant moisture; after the first watering, when the cuttings are put in, leave them an hour or two to dry, and then little or no water is required till they are rooted (of course shading, &c., when requisite). Where a few plants only are required the old plant may be taken out of the pot, say in August, and the soil shaken away, dividing and keeping only the young fresh growths. There will be plenty of roots to many of them, and therefore all old roots may be cut away, and any that have not got roots can be put in as cuttings. With the treatment just mentioned you may cut off three or four crops of cuttings in the course of the autumn, and then have the bottoms for dividing. In potting off cuttings they should be kept close for a day or two; then air should be given gradually, and finally, the lights should be thrown off every night. At this stage they will require particular attention; mildew is likely to attack them, *i. e.* the early crops in August. As soon as you perceive it, sulphur freely the

parts affected. The insects they are subject to are green-fly and thrips. The former may be destroyed by means of tobacco-smoke and tobacco-water, and the latter by tobacco-smoke; but it must be repeated for two or three consecutive days, as the insect will otherwise recover, and be as lively as ever. When the month of August has been got over there is little to fear, for they will grow away rapidly after that. The lights should then be taken off at night, to lower the temperature and allow the plants to receive the heavy dews. Shade a little, with side air, in August from sun-heat, and indeed keep them as cool as possible. In raising seedlings you must select three or four good shaped and dwarf habited varieties, from which you will have all colours. Some object to dwarf kinds; but if a tall variety appears amongst my seedlings, I consider it a fault, as they are more apt to run back to their original varieties (shrubby), with long, straggling, flower-stalks. Seed, sown in pots or pans, comes up very freely in a few days; let the surface soil be very sandy, and only cover the seed just sufficiently to keep it from being washed off while watering; prick off from the seed-pans into store-pots. The soil I recommend is, four parts rotten dung (*i.e.*, decayed into mould) and five parts of loam; or, instead of five, say four maiden loam and one rich yellow loam. *S.*

Balsams: *W D.* All handsome blooms. The mottled ones are perhaps the most valuable.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Now that the out-door display is very much faded, every effort should be made to render this and all the other plant-houses as attractive as possible. And, perhaps, nothing tends more to this than orderly arrangement and keeping everything perfectly clean, and if cleanliness and order are attended to they will do much to compensate for any deficiency of fine specimens in flower, and will render the houses very agreeable. Greenhouse.—All hard-wooded plants, whether here or in cold pits, should be afforded plenty of room, and if this cannot be accomplished with the present stock, some of the least valuable should be dispensed with; for depend upon it, that plants to afford pleasure in the present day must be well-grown specimens of their size, and this cannot possibly be the case under the crowding system; therefore let the specimens stand sufficiently thin to prevent their branches touching, and to allow of exposing all their parts fully to light and air. With the exception of any late-flowering things that may be making their growth, and which should be kept rather close and warm, the hard-wooded stock should be kept cool and airy, giving air freely on every favourable opportunity. Watering must be done with great care and judgment, especially in the case of large specimens of delicate rooted things, giving just sufficient from now until after the turn of the day, to keep the soil from getting unhealthily dry, and, with the exception of anything near the heating apparatus, frequent applications will not be necessary.

FORCING DEPARTMENT.

Pineries.—Now that cloudy weather is likely to prevail the temperature for young growing stock should, in a great measure, be regulated by the state of the plants and the amount of light. For while robust stocky plants with a vigorous root action will bear to be kept growing freely for some time longer, those of an opposite character will, if kept in a warm temperature, make miserably weak growth. Endeavour to secure a steady bottom-heat of from 85° to 90° and to have the soil about the roots in a free healthy state, and in the right condition as to moisture, and there will be no danger of the roots being long in an unhealthy or inactive state. And if all is right at the roots, and the plants kept near the glass they may be encouraged to grow freely for some time longer without the least danger of their being injured. Use sufficient fire-heat on cloudy days to allow of admitting a little fresh air, and maintain a moist state of the atmosphere, but avoid getting the hearts of the plants saturated with condensed moisture, which is sometimes done where tanks are used, and is very injurious to the plants. The stock expected to show fruit shortly after Christmas should be carefully examined, marking the most likely ones, which should be allowed to get rather dry at the root, in order to effectually check their growth; for unless means are used to effect this, it will probably be difficult to get the plants to show fruit at the proper time: but there is still plenty of time for getting the growth matured, and only a small portion of the stock to insure a few early shows should be subjected to this treatment at present. Vineries.—Attend to former directions, and keep houses in which the fruit is ripe and expected to hang for any length of time, cool and dry. Get the borders covered with something to exclude the autumn rains before they get saturated with wet, which injures the roots, lowers the temperature, and spoils the mechanical texture of the soil; also prune the Vines where the wood is sufficiently ripe, and thoroughly clean the house, &c., when it may be used for storing Geraniums and such like lifted from the flower-garden beds, or for protecting anything that merely requires to be guarded from frost. Vines in pots should be pruned and dressed, if not already done, and placed in a cool dry house until they are wanted for forcing. Peaches.—If the wood in the late house is not ripe by this time a little fire-heat with air should be used, keeping the inside borders and atmosphere as dry as can be conveniently done. Where the wood is ripe, however, and the leaves falling off, keep the house cool, giving abundance of air at all times, and in fine weather the sashes may be removed altogether with advantage to the trees. See to replacing any worn-out trees, or such as from any other cause may be deemed unfit for their present places, selecting prime young trees from the open wall, which, if carefully removed and replanted, will carry a moderate crop next season with impunity if not forced too early.

FLOWER GARDEN AND SHRUBBERIES.

What with falling leaves and the tiresome diligence of the worms, much labour is necessary to keep lawns, &c., clean and neat at this season. There is, however, no help for it but a diligent use of the broom and roller. Continue to mow as frequently as may be necessary to keep the Grass short, for much time is lost in clearing up leaves when the Grass is allowed to get long; also keep the surface hard and smooth by frequent rollings with a heavy roller. This is a capital season for laying down turf and where levelling may be necessary, or any other alterations involving taking up and relaying any breadth of turf, this should be attended to as soon as possible, for besides that there will be no trouble with turf laid now in the event of dry weather setting in early next spring, such work can be done more economically now and with much more comfort to the workmen than after cold winterly weather sets in. Nothing adds more to the comfort of a garden in winter than hard dry walks, and where these incline to be soft and greasy, a thin sprinkling of clean, rather rough gravel, put on when the walks are wet and well rolled in, will be found to greatly improve them, and this at a very trifling cost. Keep the surface hard by frequent rollings, which will cause the water to run off to the edges, instead of draining through the gravel, as is the case when the surface is allowed to become soft and spongey. Continue to clear the beds of their summer occupants, as these become shabby, and replant them with spring flowering things. But where the soil wants renewing this should be done before putting in the spring flowering things, for it is generally a busy season when these are removed, and nothing should be left to be done then which can be done now. Plants which it may be desirable to lift and winter for use next season again, cannot be safely left out any longer, except where they can be covered in the event of a sharp frost occurring suddenly. And specimen Fuchsias, Geraniums, &c., should be got into safe quarters immediately frost is apprehended.

HARDY FRUIT AND KITCHEN GARDEN.

Examine the stock of fruit in the fruit room as frequently as circumstances will allow, and remove any infected with decay at once, and keep the room cool and dry. Where it is intended to plant any quantity of fruit trees this season the preparation of the ground, &c., should be proceeded with as expeditiously as possible while it is in good working order. And too much attention can hardly be bestowed on the preparation of ground intended to be planted with fruit trees. Be particularly careful to secure perfect drainage, for a well drained soil is essential to fruitfulness in all kinds of fruit trees, and it is worth while to secure this even at a considerable expense. Where the natural soil is not of a good quality for the kind of trees to be planted, this should be partly removed, replacing it with some good fresh turfy loam. Avoid the use of rich stimulating manures, which do more harm than good. Carrots, Parsnips, Beet, &c., should be lifted when the ground is in good order, and stored for winter use in a dry cool place; stack them in sand to preserve them from shrivelling, &c. Spring Broccoli that may be growing very rank should be laid down with the heads to the north, which will check the over-luxuriant growth, and afford a better chance of its standing a severe winter. In the event of sharp weather being apprehended, a quantity of the most forward Lettuce should be placed under glass, and Cauliflowers that are heading should also be removed to where they can be protected from frost.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Oct. 19, 1854, as observed at the Horticultural Gardens.

Oct.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth 1 foot deep.	2 feet deep.	Wind.	Rain.
Friday 13	21	30.419	30.338	60	34	47.0	54	55	N.	.00

Satur. 28	54.0	37.5	45.7	15	1.06	—	5	2	—	5	8	3	5

The highest temperature during the above period occurred on the 22d, 1830—therm. 69 deg.; and the lowest on the 26th, 1850, and 28th, 1836—therm. 23 deg.

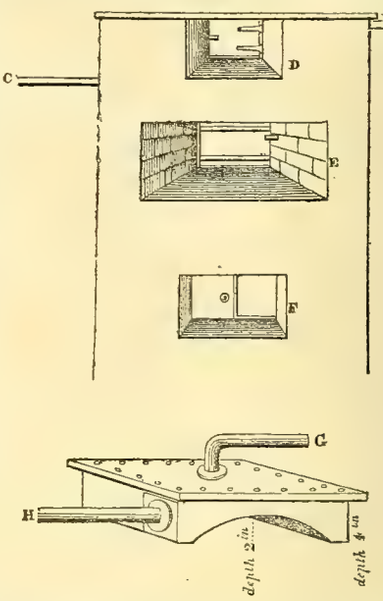
Notices to Correspondents.

Australia: *Banff.* Have a chest made with inch or inch-and-half boards. In it pack your Whitethorns now, pouring wet sand over them, shaking them down well, so that the sand may fill up every crevice; and when all is full, and the water drained off, nailing down the lid, and securing the whole, if large, with iron hooping. The Thorns should be at least four years old, with plenty of sound wood. You may as well trim off the spray before packing. In this way Whitethorn will live five or six months, which is long enough. If you have a difficulty in getting the water to drain away from the sand, bore a few holes in the bottom of the chest, and afterwards plug them again.

Books: *Reader.* M'Intosh's "Book of the Garden" may possibly answer your purpose.‡

Blackberries: *J L.* We do not know what is meant by the new Rochelle Blackberry. Many kinds of Rubus inhabit the United States, and are *said* to be good for table, but they have never yet found favour in Europe, where men's tastes are more refined than in the New World.

Heating: *I. of Wight.* Any contrivance of the nature of an Arnott's stove will do where so little is wanted and the climate is so good. The following plan of a stove used with advantage by Mr. Rivers would probably be the most economical you could have. We reproduce the cut from our volume for 1849, p. 292, where you will find further information.



A, iron plate; B, flow-pipe; C, return pipe; D, door over the boiler; E, feeding door; F, ash-pit door; G, flow-pipe, made of wrought iron, screwed in so that it can be turned in any direction; H, return-pipe.

Hybernation: *I W L W.* If you have a fair quantity of side light you need not have any glass at all in the roof. Such plants as Myrtles, Orange trees, Aloes, Tree Rhododendrons, &c., will keep during the winter, even if very much in the dark. But you must take care that the place is not damp enough to cause the leaves to rot and fall off.

Names of Fruits: *B D F.* Your labels 1, 2, 3, 4, 5, were found, but all astray. However, the large Pear is the Uvedale's St. Germain; all the others, the Chaumontel. The Apple, a greyish green, is the Orme; and the two smaller, wild or Cider Apples.‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Rusticus.* Gymnogramma aurita Hook, native of India. *S.*—*A Z.* Parochetus communis.—*J B.* Tamarix gallica.—*Erzeroum.* 1053, Euphorbia Peplis; 851, E. dulcis; 1222, Andrachne telephioides; 1098, Buxus sempervirens; 1005, Euph. myrsinites; 990 and 111 are too young for determination; they want fruit. The former may be pithyusa, the latter is probably provincialis.—*W T.* Saccolabium umbellatum and Cœlogyne ovalis.—*A B C.* Zygopetalum Mackai, and Scolopendrium officinarum.—*J. Jeyes.* Lapageria rosea.—*Subscriber.* Oncidium excavatum and Kaulfussia amelloides.—*Gale.* Callistemon speciosum.

Pears: *J J.* Your Beurré Diel Pears which you left to hang on the tree till November, and were then taken in, packed in dry fern, placed in a dark rather damp cellar, where they kept till February but never ripened, should have been kept in a warm dry place, in a temperature of 60°, gradually increasing to 65°.‖

Russian Muskets: *Strawberry Leaf.* It is inconceivable that the stocks of these arms should be made of deal as you suppose. None of those captured at the Alma have yet reached England that we know of; but we entertain little doubt that they will prove to be manufactured from Maple wood (Acer campestre), a common tree in the Caucasus, and we believe a pretty good substitute for Walnut wood.

Stocks: *Alpha.* You will find the information you seek in Mr. Rivers' advertisement, p. 659 of our last week's number.‡

Training Fruit Trees: *J G P.* Taking all circumstances into consideration, we would advise you to train your Apple and Pear trees as espaliers; also the Bigarreau Cherry, in order that you may have it in your power to net it, and thereby prevent the birds from taking the largest and best share of its fruits. Recollect, however, that you must not train the branches of this, or of any other stone-fruit tree, horizontally direct from the stem; they must curve gradually from the latter in the first instance, otherwise they are apt to die off. The reasons for recommending espaliers rather than dwarf standards are—first, because the espaliers bear earlier, and the fruit from being well exposed to the air and light is better flavoured; secondly, the trees are much easier managed than dwarf standards. To manage the latter well requires a deal of summer work, which you could not well instruct a mere rustic to perform. You can scarcely prevent dwarf trees from growing to wood, and they occupy more ground than espaliers; you cannot crop between them so well as you can between espalier rows.‖

Misc: *C M G.* Ackermann's, in the Strand.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.

Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.
It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

THE FOLLOWING ARE COPIES OF TESTIMONIALS IN FAVOUR OF JACKSON'S PREPARATION FOR PRESERVING POTATOES, SEEDS, &c.

"Belmont Farm, Eltham, Kent, August 28th, 1854.
"Sir,—I am now about to perform my promise, to let you know how your prepared Potatoes have turned out here. As a practical farmer of some experience I had despaired of finding any remedy for the disease; but I must confess that a stronger proof of the efficacy of your process in Preserving Potatoes, could not have presented itself than I have now to relate. One of the fields of this farm, the property of Mrs. Stanbury, was planted with Regent's Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the smut. Any person may see the difference of the prepared and unprepared Potatoes at a glance. You are at liberty to make any use you please of this letter, and I remain, Sir, your obedient Servant,
"G. B. BAXTER.

"To Mr. Jackson, 18, Cannon Street, London Bridge."
"Sir,—I am very much pleased with the result of the experiments I have made with your prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease and in a very fine condition; while those of the same sort unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms. The Potatoes from the Prepared Seed were so remarkably good, that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others,—or about 25 per cent. in favour of your preparation. I need not say that this is quite satisfactory to me, and it is of so much importance to the public, that it ought to be generally known.—I am, Sir, your obedient Servant,
"T. AUSTIN, Nurseryman and Seedsman, Blackheath, Kent.
"To Mr. Jackson, 18, Cannon Street, London Bridge."

"Hythe End Farm, Wraysbury, Staines, Sept. 5, 1854.
"Sir,—I have very great pleasure in informing you of the result of the experiment made with your Patent Preparation, for preserving Potatoes from disease. I am not yet able to give you a report of the whole crop, as I planted very late in the season, and the Potatoes are still growing; but so far as I have ascertained the result fully bears out the statement made by you, as to the complete efficiency of your process in preventing disease. I had the prepared and unprepared planted in adjoining plots, among the unprepared I find the disease in the same form it has assumed during the past few years, while in the plot adjoining, and which were prepared by you, there is not to be found the slightest appearance of disease.—I am, &c., THOMAS BUCKLAND.
"To Mr. Jackson, 18, Cannon Street, London Bridge."

"Stone Grove, Edgeware, 15th Sept., 1854.
"Sir,—You will be glad to hear that your prepared sets of Potatoes have turned out very well here, both as to quantity and quality, while those in the adjoining ground, which were planted with unprepared sets, have the disease as badly as ever. The agriculturists are much indebted to you for discovering so valuable a remedy for the Potato blight, Mr. Wylde is as perfectly satisfied as I am with the success of your patent for preserving the Potatoes from the disease; and there is no doubt the same preparation would preserve Wheat from the Smut, and every description of corn and vegetable from the blight to which they are subject.—I am, THOMAS PRIEST, Bailiff to H. Wylde, Esq.
"To Mr. Jackson, 18, Cannon Street, London Bridge."

To Admiral Sir JAMES A. GORDON, K.C.B., Marlee House, near Blairgowrie.
"Sir,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. Jackson, were planted in a piece of new ground; and according to the directions sent by him along with them as to distance between the plants, &c. They came up well; the tops showed some appearance of disease about the middle of August. I have dug up a few stems to see the state of the Potatoes, and there is not the slightest appearance of any disease; they are very large and very prolific; they are quite ripe, fit for taking up. There were long black Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased.—I am, Sir, your most obedient Servant, (Signed) JOHN SHANKS.
"Kildrummy Castle, Aberdeenshire, 25th Sept., 1854."

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6l. per ton, free to Railway.
They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.
Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

LAND DRAINAGE.
MR. JOHNSON begs to inform Landowners, Agents, &c., that he is prepared to undertake the Drainage of any description of Land, either by contract, or by a small charge per acre for planning and setting out the drains, taking levels, and superintending the work. Numerous satisfactory references can be given by Mr. J., who has been for several years in constant practice as a Draining Engineer.—Address 12, Abingdon Street, Westminster.

LINSEED AND CORN CRUSHING MILLS.
E. R. AND F. TURNER, St. Peter's Iron Works, Ipswich, have, during the present season, obtained the Prizes of the Royal Agricultural Society at Lincoln, the Bath and West of England Society at Bath, and the Yorkshire Agricultural Society at Ripon, for their celebrated ROLLER MILLS for Crushing Corn, Seeds, &c. These are manufactured of various sizes, particulars of which, with Illustrated Catalogue of Steam Engines, new Prize Chaff Cutter, and a variety of other Implements, manufactured by E. R. & F. TURNER, may be had free on application at the Works, Ipswich, or by Post, inclosing two postage stamps.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY's Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

THE BIRMINGHAM POULTRY SHOW, 1854.
The SIXTH GREAT ANNUAL EXHIBITION OF DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of December next. Copies of the Prize Lists and Certificates of entry may be had on application to the Secretary.
In addition to the prizes announced in the list dated the 23d of February last, the General Purposes Committee of the Council have resolved to offer First Prizes of 2l., and Second Prizes of 1l., for Single Cock Birds of any age, of all the following varieties, viz.: Dorking, Spanish, Cochin China, Bramah Pootra, Pencilled Hamburgh, Spangled Hamburgh, Game, and Polish; and that the same shall be entered under Letters A to H on the ordinary certificates, and exhibited separately.
Seven Silver Vases, of the value of six guineas each, will also be awarded, instead of money prizes, for the best pen of Pencilled Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, and Game Fowls.
First, Second, and Third Prizes of 3l., 2l., and 1l. respectively, are offered in all the Classes for Fowls, as well as for Turkeys, Ducks, and Geese. Liberal Prizes will also be awarded to good specimens shown by Cottagers, whose entries must be made on a form of certificate different from that used for the general classes.
The ENTRIES CLOSE on SATURDAY, the 11th of November.
JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham, Oct. 7, 1854.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of December next. The PRIZE LISTS and Certificates of Entry may be obtained on application to the Secretary. The Entries close on Saturday, November 11. JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham.

SUSSEX, KENT, AND SURREY POULTRY EXHIBITION.—The ANNUAL SHOW of the REIGATE POULTRY SOCIETY, open to the above three Counties, will be held at the PAVILION, BRIGHTON, on the 21st, 22d, and 23d of November.—For particulars apply to Mr. JAMES FISHER, Reigate, Mr. GEORGE K. KING, 155, North Street, Brighton, E. N. HARPER, Esq., Reigate, and CHARLES HART, Esq., Dorking, Honorary Secretaries.

SMITHFIELD CLUB, 1854.
CHRISTMAS FAT CATTLE SHOW.—The Annual Show of Fat Cattle, Sheep, and Pigs, will take place on the 5th, 6th, 7th, and 8th of December, 1854, at the Carriage Bazaar, King Street, Portman Square, London.
All Certificates must be returned to the Honorary Secretary on or before SATURDAY, the 4th November, 1854.
Prize Sheets, and the necessary Printed Forms of Certificates, are now ready, and can be obtained on application to
B. T. BRANDRETH GIBBS, Hon. Sec.
Corner of Half-Moon Street, Piccadilly, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 21, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, October 26—Agricultural Imp. Society of Ireland.

IT will be seen from the advertisement that this day fortnight is the last on which entries can be received by the Secretary of the Smithfield Club for the ensuing show in December. And we may also call attention to the fact that new classes for Welsh cattle have been this year established, so as to relieve them from having to compete with the Scotch breeds.

THE current number of the Edinburgh Quarterly Journal of Agriculture contains the address of Mr. HALL MAXWELL at Berwick, on the scheme which he had devised for the collection of the Scottish Agricultural Statistics; the current number of the Irish Agricultural Society's Journal contains one of the many provincial addresses by that gentleman, given in order to remove the prejudices, enlist the sympathies, and ensure the assistance of the agriculturists in the different counties of Scotland; and the last number of the *Edinburgh Evening Courant* contains an interesting and satisfactory account of the successful progress hitherto of the inquiry itself. The skill with which the plan had been devised, assisted as that was by the experience of last year's preliminary attempt—the tact with which it has been introduced and urged within the several localities—the energy and industry with which the whole business has been carried into effect, has been rewarded with a large measure of actual success, and a probability, almost as good as certainty, that the affair will result in actual and satisfactory accomplishment. It is simple history to say, that for the scheme itself, its prosecution, and its accomplishment, the country will have to thank the Secretary of the Highland and Agricultural Society of Scotland. And the success of such a work will be no small boon to the agricultural interest. It will be the earnest of its own extension to the whole of England another year, and of its own gradually more perfect development everywhere, as experience year by year gives skill on the one side, and confidence on the other, to those who guide the inquiry and those who answer it.

Mr. HALL MAXWELL has, we are sure, on this account done good service to the commonwealth, and especially to that one section of it in which we are more especially interested. And the long array of names which the papers give us as his staff of "enumerators," by whose local influence success is ensured, is at once the proof of his own well-earned agricultural status in the North—and of the debt which agriculture generally owes to Scottish enterprise and intelligence in connection with this subject.

We do not at present recur to the points on which the policy of this inquiry turns, they have already often been brought before our readers. The following, which describes the mode of operation which is being adopted in Scotland this year, is condensed from the article in the Edinburgh paper already alluded to.

The machinery of last year has been again employed. The country has been subdivided into about a hundred districts. In each district an enumerator, being a farmer, has been appointed; as also a committee of farmers, of which one member is chosen from every parish in the district. Schedules have been sent to every occupier of land with a rental above 10l. in the Lowlands, and 20l. in the Highlands. These schedules are not to be issued or collected through the enumerator, as in the experimental inquiry of last year, but transmitted and returned directly to the Secretary of the Highland Society. No farmer need, therefore, fear his neighbour gaining the particulars of his crops and stock. From these individual returns will be ascertained the arable acreage and cropping of the district, as well as the amount of stock. And as to the yield of the harvest, each enumerator is asked to call his committee together after harvest, and after a few experiments have been made in threshing, and from their experience and knowledge, an estimate is to be made of the yield per acre of each kind of crop in the district. The results of the whole harvest will, therefore, be readily determined on accurate *data*, by a simple arithmetical process.

In order to collect complete returns, lists of the occupiers of land have been supplied by the property and income tax assessors of the several districts. These lists, when received, showed an aggregate of 47,000 occupiers of land in Scotland, and to each of these occupiers schedules have been issued, with one blank table, requiring the acreage of his farm or farms stated in Scotch or imperial measure, distinguishing the extent under cultivation, and the acreage of the different cereal and green crops, as also Grass, under rotation, permanent pasture, &c., and another table for classifying the stock as at 21st August. These schedules were requested to be returned, if possible, before the end of September. A large proportion of them have accordingly, we understand, been returned, and are in course of being arranged and tabulated.

The paper goes on to describe the duties of the several officers concerned in the inquiry, but to these we need not now refer. Our object has been simply to state the fact that the inquiry is successfully progressing in the north, and to point out the causes to which that fact is due, in order that we in England may learn by the experience of Scottish agriculturists, and be stimulated by their example. As to the cost of the Scottish inquiry, we are told that the grant by Government for the collection of the statistics is 6000l. Fully one-third of the sum may be estimated for preliminary expenses (nearly 500l. having been already expended on postages).

Some payment, proportionate to their trouble, will, we understand, be made to the district enumerators; but, unless for special services, it is not contemplated to extend the remuneration to members of committees. The number of enumerators is above 100, and of members of committees about 900. About two per cent. of the occupiers in the kingdom will, therefore, be directly engaged in the preparation of these returns.

DAIRY STATISTICS.

In valuing an estate it is necessary to take an estimate of the probable expense of cultivation, as well as the probable return which the capital employed by the farmer during an average of years may produce. For the purpose of coming to a satisfactory conclusion on these two points, I have always, in valuing land, taken notes of all the live and dead stock as I went over the farm. The money value of these, together with the probable expense of the labour employed, will form the amount of the capital which the farmer employs under his peculiar mode of management. The following table gives these particulars as they were taken some years ago.

Statistics of 15 Dairy Farms, being part of two parishes in the Vale of Gloucester.

Farm.	Extent.		Live Stock.					Produce.					
	Arable.	Pasture.	Cows.	Calves.	1 year olds	2 years old	Horses.	Sheep.	Cwts. of Cheese.	Lbs. of milk Butter	lbs. of whey Butter	Cows sold.	Calves sold	Bacon, score lbs.

The account of the live stock was taken as I walked over the fields, while valuing each farm; the quantity of cheese, milk butter, whey butter, and bacon, I learned from the farmer and his wife in conversation with them.

The system universally adopted by the dairy farmer is to rear as many heifer calves as will keep up the quantity of cows as they become unprofitable milkers. The milk butter is made only in the spring, when a small number of cows have calved; and while they are fattening calves they reckon that half their number of cows during this period gave 6 lbs. of butter each weekly for four weeks, this is 24 lbs. of butter each for half of the cows, or at the rate of 12 lbs. of butter per annum for each cow, and each cow will give 1 lb. of whey butter weekly for 26 weeks; and they calculate on fattening a pig of about 12 score for every three cows, this is equal to 4 score of bacon per cow per annum.

From this account it appears that the pasture land has produced 105 lbs. of best Gloucester cheese, 3 lbs. of milk butter, 5 lbs. of whey butter, and 11½ lbs. of bacon per acre. The live stock and the implements and labour employed on the farm, were valued as under:

	£	s.	d.
439 Cows at 12*l.* each	5268	0	0
85 Calves at 2*l.* each	170	0	0
85 Year-old Heifers at 5*l.* each	425	0	0
85 Two-year old Heifers, at 8*l.* each ...	680	0	0
38 Horses, old and poor, at 10*l.* each ...	380	0	0
127 Sheep, at 30*s.* each	190	0	0
150 Pigs, at 30*s.* each	225	0	0
The Implements were valued at ...	1050	0	0
The Labour at 15*s.* per acre ...	1480	0	0
	£9868	0	0

The amount of Capital is ....

Thus the capital employed in managing these 15 dairy farms is about 5*l.* per acre.

The economy and management of the dairy farms in Gloucestershire are the same as they have been from time immemorial; the same at present as they were 40 years ago to my knowledge. There is no art nor labour used to increase the productiveness of the land. The farmer just takes what Nature gives him as the food for his cows, and is therewith content. There is no system adopted to improve the herbage, nor any change in the economy of the farm. Those fields which have been pastured for ages are still the favourite fields for the cows to graze in, because they are said to be "the most cheesy ground;" they are therefore always pastured by the cows every year, while all the others are mown for hay. The fields therefore which are constantly pastured are yearly getting better, while those which are always mown are daily getting worse.

The Gloucester dairy farms are small, from 50 to 100 acres; nearly the whole of the land is in pasture. The fields are small, from 8 to 10 acres; the fences, being hedges, are principally composed of Hazel, Blackthorn, Elder, Maple, and Briars, and every shrub natural to the soil.

There is little labour required on the dairy farm; to fetch the cows home from the field—milk them morning and evening—turn them out to the field after milking—fodder the cows and young stock in winter and spring, morning and evening, by cutting the hay from the rick, and carrying it on the shoulder with the foddering pick to the stock in the field, and parting it out in small portions at a distance from each other, so as to prevent the stock disturbing each other as they are taking their breakfast or their supper, and in the spring attending to the cows as they drop their calves; taking care of the young calves and attending to the fences—is the amount of the out-of-door work performed on the dairy farm. To do all this a man and a boy and a maid are all the hands that are required on a farm of 90 acres, on which 25 or 30 cows are kept.

The dairyman's business begins early in the morning, between 4 and 5 o'clock in summer, and by twilight at all other times; and again about the same time in the afternoon. All hands are turned out a milking—men, women, and boys—the farmer making one of the number. Nine to ten cows are allotted to each pair of hands; the milk is then brought to the dairy, and handed over to the dairymaid at the door, as no dirty feet are admitted into the dairy.

The dairy farmers are universally married men—indeed this seems to be necessary, as the principal and most important part of the business is to convert the milk into cheese and butter, and as this is all performed in-doors, by female hands, the farmer's wife attends to these operations, and when the farm is small she performs the whole of this business; and as the quality of the goods depends entirely on her management, she is the most important and the most efficient member of the establishment, for by her skill and ingenuity the milk is converted into the richest and most nutritious of all food for every class of the community.

The single as well as the double Gloucester cheese, when made of the entire milk, as it comes from the cows morning and evening, is the richest and mildest of all cheese, as all the butter in the milk is thus in the cheese; it is called *coward* cheese, as it cannot "stand the fire," for it runs and drops all away when it is being toasted. The half coward is made in the morning from the morning's milk, as it comes from the cow, and the last evening's milk, from which the cream has been taken; thus the morning's milk and the skim milk are mixed together, and the cheese made from this is called half coward, because most of it burns before it will run; this is very inferior cheese. *J. M.* [We hope some of the dairy farmers of Gloucestershire will defend themselves, if their case admits of defence.]

WHEN FARMERS SHOULD DISPOSE OF THEIR GRAIN.

The following remarks are from the pen of the editor of the *Witness* (Edinburgh) newspaper:—

"On the subject of prices we have a speculation to lay before our agricultural friends, and they can resolve it at their leisure. It is only a speculation, but it has occasionally been broached by some of the highest practical authorities, who are both growers of corn and frequenters of markets. It relates to the question —'When should the farmer sell his corn?' Grain fluctuates in price, perhaps, more than any other article of staple consumption. We do not buy a coat for two pounds one year, and a similar coat for four pounds another year; yet we purchase a quarter of Wheat one year for 40*s.*, and another year for 80*s.*, or even 100*s.* These fluctuations are enormous, yet they occur within comparatively short periods. But the fluctuation in price from year to year is not the only species of change in the value of produce to which the attention of the farmer is called. Grain fluctuates from month to month—from season to season. A farmer who has 100 quarters of grain to sell may be a hundred pounds richer or poorer by keeping his grain for a month, and, consequently, his trade is to some extent precarious. It may be said that a sound judgment and sufficient experience will enable a long-headed and prudent man to anticipate the coming changes, and to regulate his sales accordingly; but, so far from this being the case, it is not unfrequently the longest heads that plunge deepest into the mire of unfortunate speculations, and the most knowing who are the most completely outwitted in their calculations. Who, for instance, could possibly have anticipated, that, in the midst of a war which has compelled us to arm the greatest naval force ever seen in the world—when no man can possibly predict how or when the war may end — that funds should rise, and that the price of grain should fall? This is an unprecedented anomaly. Had we borrowed an immense amount of money, which we were to expend ourselves, and bequeath the obligation of payment to our children, we might, perhaps, have expected that the distribution of the borrowed capital might have afforded us a temporary prosperity. But, not at all; we take the whole responsibility of the war; pay for it down on the nail, in market phrase; and yet the public securities, which, as we are at war, are rendered *so far* less secure, actually rise in value; and grain, the staff of life, largely derived from the very country with which we are at war, seeing that we grow scarcely sufficient for ourselves, falls in value. The longest head that ever saw further than its fellows could scarcely have dared to suggest a result like this; and yet it is a fact, palpably before the eyes of the world, and astonishing us, the home-born Britons, quite as much as it must astonish the observers in all other countries. Probably some farmers have held their grain, and probably some speculators have bought, in the anticipation that the fact would be otherwise; and those who have not sold their corn are eminently likely to obtain a less price than those who have. The price of grain is, perhaps, happily always beyond the range of human prediction. When we can predict wind, rain, storm, sunshine, and every other phase of the weather, we may, perhaps, predict the price of grain, but not till then. It is quite possible that a farmer may make what is termed a lucky hit; but we very much question whether a farmer, who either holds or sells on the speculation that prices will either rise or fall, ever permanently succeeds so well as those who act on another principle. The business of the farmer is to cultivate, not to speculate; and, when he quits his proper business for a crude estimate of what foreign politics or unknown weather may possibly bring, we apprehend that, in the long run, he will discover that he has made a bad investment of his time. But happily, there is another mode of determining the proper period at which the farmer may calculate that he sells with safety—a mode which we have heard wise men say is the best of all—namely, the period which is best for the farm, irrespective of all foreign politics, Czars, Turks, Tartars, Cossacks, allies, or anything whatever, save only the best way possible of managing the farm. It may appear that this is rather a summary proposition, and we only throw it out for the consideration of our friends the corn-growers; yet we cannot help thinking that it has an element of very sound sense at the bottom of it, and that the system which is best for the farm must, ultimately, be best for the farmer. With a steam-mill it is quite easy to thrash off a crop in a few weeks, and, occasionally, such a venture might produce most money—to be followed, however, by inconvenience in the farm-work and farm-feeding, all the rest of the season; and the question is, whether any amount of human foresight could—say on a period of 10 years—secure a greater advantage by a speculative attention to prices, than by ordering everything, sales included, exactly as was most conducive to the agricultural welfare of the farm itself, and by taking the market-price at the time, and in the quantity, which the farming operations required. The thrashing and the sales would thus come to be distributed, not by an attention to wars and rumours of war, but by an exclusive attention to the more and more perfect outline of the farm; and the farmer would thrash and sell exactly as his horses, cattle, labour, manuring, and other things required—going to market with his grain, not with regrets that prices had fallen, or fearing that they might rise, but with the honest consciousness that he was doing his best to be a good farmer, and to leave speculations to those whose especial trade it was to deal, and not to cultivate. Good farming will, in the long run, be incomparably more profitable to the farmer than speculating, however fortunate or however clever the latter may happen to be occasionally."

COMPETITION OF REAPING MACHINES AT STIRLING.

All the machines exhibited this year seemed to be less oppressive to men and horses than those of last year. The dynamometer was applied this year to all the competing machines in order to test their comparative draughts. The general result was, that the draught in the highest case did not exceed that of the common plough turning over a furrow of 7 or 8 inches in depth. It would thus appear that the oppression on men and horses exercised by the reaping machines in use arises more from the speed at which they are driven than from the resistance offered by the crops they have to cut down. It is quite evident that they are all driven at too high a speed, even as worked on a private farm. The excitement of a public exhibition has no doubt the effect of urging both men and horses to do more in a given time than when they work at home. The speed we should estimate at not less than three miles an hour, if not more. But, whatever be the rate of speed, the gatherers and binders have to follow at a racing pace, and the work in consequence is usually done in a slovenly manner, or partially left undone. Even on private farms, when the ground and crops were peculiarly favourable to the operation of the machine, we have seen part of the grain left in the swathe, or part of the sheaves left unstacked. It should be the endeavour of machinists to construct reaping machines to require a speed not exceeding two miles an hour. Five machines entered into competition, two of which were Bell's, two M'Cormick's, and one Hussey's. Both the Bell's were, we believe, of Crosskill's manufacture, though differing somewhat in their gearing. One belongs to Mr. M'Queen, of Arnchive, the other to Crosskill himself. One of M'Cormick's was his original reaper, with a man to sweep off the grain to one side in bundles with a rake; while the other was exhibited by Lord Kinnaird, with a revolving web, like Bell's, but which did its work badly compared with Bell's, and the addition of which increased the draught by 1 cwt. 60 lbs. Hussey's had a tilting-board upon which the cut grain fell, and which was tilted by the man's foot who shoved the grain off it behind the machine in bundles with a rake. The mode of comparing the work done by the machines was better adapted for that purpose than that of last year. Equal portions were measured off in different sorts of grain, and the portions were drawn for by the competitors to be cut down by their respective machines. The crops selected were Wheat, Barley, Oats and Beans. The Wheat was thin on the ground—perhaps not more than half a crop; and, as a consequence, much undergrowth of weeds was amongst it. The Barley was a heavy crop, and sown down with Grass. The Oats were also heavy. The Beans were strong at some places, at others not. The straw of the crops was long and strong. Not having had t

opportunity of witnessing the working of the machines on trial, the judges alone enjoying that privilege, we can give no satisfactory account of it. The judges awarded the premium to Crosskill's Bell, as the best machine above 25 guineas value, and to Hussey's as the best one below that value. To Crosskill's Bell was also awarded the Highland and Agricultural Society's premium offered for the best machine at the Berwick show, but, on account of the state of the crops, the award could not then be pronounced.

And in witnessing the action of the machines on the different crops after the competing trials, we should say that Crosskill's Bell did its work very satisfactorily, cutting the corn low and clean, and laying it over in swathe in a very regular manner; and where the crop was strongest, it seemed to lay the swathe with the greater regularity. The Bell's machine exhibited by Mr. M'Queen did not execute any of its work nearly so well as the one exhibited by Crosskill himself. We like the quiet calm manner in which M'Cormick's original machine works, and its dexterity in turning corners and passing deep furrows is admirable. The labour endured by the man who sweeps off the grain in bundles for sheaving is however too great, and we think he did not do his work so well this year as we have seen him do it in previous ones, most probably because the crops were too thick and bulky for him to handle with ease. His work, as well as the others, was best done among the Wheat, which was much the thinnest of the crops. The removal of a heavy bunch of grain from the board by one man with a rake seems too great a physical difficulty to encounter at the speed at which the machine goes, and the breadth of 6 feet which the machine cuts. Can the proportions of the work to be done not be made more consonant with the strength of a man? Lord Kinnaird has by no means improved M'Cormick's machine by the addition of the revolving web. Instead of simplifying, his addition only complicates the machine. We had imagined, on a former occasion, that Hussey's machine would never show face in Scotland again in the presence of Bell's and M'Cormick's, but here it carries off a prize in virtue of its low selling price alone, for no one will assert that it was the second-best machine in the field. Whatever may have been the cause of its meriting the first prize as the best reaping machine at the Lincoln meeting of the English Agricultural Society, its low selling price seemed its only merit at Stirling; and this is a merit certainly, and ought to demonstrate to machinists that any operation beyond cutting down the grain imposes, in a reaping machine, a most serious increase of cost in its construction. Can the decision of this premium not suggest a valuable hint to machinists? The delivery of the grain in the rear of Hussey's machine on the ground upon which the horses have to walk in the next round, is an insuperable objection, in our estimation, to its mode of operation. True, the grain can, and perhaps ought to be gathered up immediately after the machine, but the obligation to do so is a restraint which ought not to be imposed upon a farmer in the time of harvest. It may be of the greatest importance, in some particular season, to employ every means—machines and all hands—on a farm, to cut down as much as possible of the crop at a time: as, for example, when the state of the atmosphere prognosticates a gale of wind, in order to avoid a shake, while the crop would be in comparative safety lying on the ground in swathe or in bundles until it could be bound and stacked.

The comparative trials of 1853 seemed to have established the superiority of the cutting edge over the shears. At any rate, the shears have this year been removed from Bell's machine, and the cutting edge adopted. Hussey abandoned the shears at an earlier period, and assumed the cutting edge. The principle of cutting, first exhibited by M'Cormick in this country, has thus triumphed, for the benefit of our farmers, and of our horses; for no doubt the fine edges of shears, working closely on each other, occasioned much of the friction and the inconvenience experienced in the working of Bell's machines. By abandoning the shear principle of cutting in Bell's machine, it has doubtless thereby been simplified in construction, and eased in draught. We have admired M'Cormick's mode of cutting, from the first moment we saw his machine in the Crystal Palace in 1851 until now, and when its efficacy was confirmed at Tiptree farm in the same year. Now it is adopted by his rivals. No doubt Crosskill's serrated-edged cutter and Hussey's smooth-edged cutter are modifications, and not imitations of M'Cormick's cutter, but perhaps these modifications were adopted only to avoid the appearance of close imitation, and not because they were better. We still prefer M'Cormick's arrangement for its simplicity and lightness.

From the number of new machines entered for competition, it is evident that the desire to have a useful reaping machine is occupying the minds of farmers. The society will have to afford these new machines a comparative trial next year. One only, however, was exhibited this year—that invented by Mr. Simpson, of Westmains. Its object is not only to cut the corn, but to gather and bind it into sheaves ready for stooking. The gathering and binding into sheaves are effected by means of three men, who are carried upon the machine. One gathers the corn in his arms from the cutter, in bundles the size of sheaves, while the other two place the bands and bind the bundles alternately into sheaves, and throw them upon the ground. The bands are previously made and placed on the machine for use. It cuts the corn very well, but the form of the shears is no improvement on M'Cormick's cutter, nor was the form of the shears what one would altogether desire.

Mr. Simpson employs three men on the machine. Two are quite sufficient to gather corn into bundles and to bind it into sheaves; but if three are requisite for this breadth of his machine, reduce the breadth until two are sufficient. On a machine cutting 3 feet in width, one man could easily bunch the corn as it is cut, and a second lay down the bands and bind the bundles into sheaves. It is not necessary to use corn-bands for binding the sheaves; it would be better not, since the corn-knot is seldom loosened at the threshing-mill, and the most of dirty threshing arises from the corn-knots passing through the mill half threshed. Bands could be made of thick soft cord, and prepared with a loop at one end; the bandster could easily and quickly pass the other end through the loop, draw the cord tight, and push its end below the band. Such bands would be well preserved in the stacks, easily loosened at the feeding-in band, and could be carefully kept for years when not in use. No corn-knots would thus miss being threshed. Supposing such a reaping machine to cut three feet in width, and the horses to walk two miles an hour, it would cut, in the course of ten hours, rather more than seven acres of corn; but from the time lost in turnings and stoppages, the quantity cut would perhaps not exceed five acres in ten hours, but say four acres. One man would gather four acres of corn in ten hours, and a second bind four acres, especially when neither have to walk about, and a third stook four acres. One lad more is only required to drive the horses. Give the gatherer and bandster 3*s.* a-day each, the stooker 2*s.* 6*d.*, and the lad 1*s.* 6*d.*, and the expense of their joint labours would be just 2*s.* 6*d.* an acre. One farmer tells me that his Bell's machine requires 15 persons, men and women, to gather, bind, and stook 10 acres of corn, independent of the driver of the machine, and an attendant besides, to keep everything in working order; and another mentions 18 as the number of men and women required to follow his Bell's machine, beside the driver and attendant. I have seen as many as 15 persons, nine women and six men, following a Bell's machine, and they had enough to do to keep up with it. They could not, indeed keep pace with it, but got up to it by the time it had turned. We know not what such a small reaping machine as we have described would cost in making. It could not cost much money, and it would be light, and, besides, the cutting gear may yet be much simplified. It would be useful to small farms, and therefore would come into general use, and those who farm largely could employ a number of them. A machine thus manned and employed by itself would allow all the women and the elderly men of a farm to be formed into a band of reapers, to cut an entrance into, and clear the sides and ends of fields for the reaping machine; and they could also cut all the lying patches of corn that were unfit for the machine to reap. As it appears to us, any of the reaping machines in use at present that cut their 10 acres a-day are unfit for use on small farms, and these constitute the largest proportion of farms in this country. A good small cheap reaping machine is thus yet a desideratum among our implements. *Journal of Agriculture.*

Home Correspondence.

Spade Husbandry.—The following observations are made after the experience of a few years in spade husbandry, with a view of inducing discussion and obtaining information, not of laying down the law or pretending to any particular wisdom in agricultural matters. England possesses the great advantage of having many wealthy and energetic landlords and farmers, who are ever ready to carry out experiments at any cost; not only for their own benefit, but also for that of their neighbours. The difficulty is to decide upon the value of any scheme for the improvement of agriculture which is offered to public notice, and how far it is advisable to recommend it for general use. Draining, without which it is impossible to bring stiff clay land into profitable tilth, is still an open question. The success of the operation depends very much upon the manner in which the land is cultivated after the operation; the deeper it is trenched the greater may be the distance of the drains apart. On pasture they should be placed nearer each other and shallower, excepting in cases of tapping springs. The fault is as great in over, as under draining. What expense might be spared if the wants of the land and its capabilities were thought of before a tool entered the ground! The object is not to get rid of the rain in the shortest possible time, but how to render it most available for the purposes of vegetation, and at the same time prevent the water resting and becoming sour at the roots of plants. In the growing season moisture below the surface is most essential to the health of all crops; this may be obtained on judiciously drained land by frequently stirring the soil, thus admitting the warmth of the atmosphere, and causing the damp to rise by attraction. On the contrary, if the top is hard and impenetrable to the fork, it resists the rays of the sun, becomes both above and below as firm as a turnpike road, and without the requisite nourishment, which is soon visible in the unhealthy aspect of the crops, be they what they may. In hot, scorching weather it is astonishing to observe the effect of loosening the soil amongst Cabbages and Cauliflowers,—not deep enough to injure the roots, but sufficiently so to admit oxygen and heat to bring up the moisture from below. Draining-pipes should never be less than 2 inches in diameter. Another mistake is using artificial manures (artificial, indeed, if analysis can be depended upon), to the neglect of those within reach, the liquid running into the nearest ditch or brook, and the solid drying under a powerful sun, to the destruction of its most valuable properties, which in a great measure might be saved by covering the heap with anything in the shape of dirt; the expense of collecting materials for this purpose when the team was idle would be repaid with interest. Home guano may be made on every holding by saving all night-soil, the sweepings of pigeon and fowl-houses, together with the droppings of cows, now so disfiguring the fields, and spoiling the Grass for want of early spreading; the patches of herbage being so rank, animals will scarcely touch it whilst there is anything else to be eaten. The cows' manure might be collected every third day by a boy with a wheelbarrow, and still enough would be left to fertilise the pasture. These ingredients should be placed under cover as they accumulate, adding equal quantities, in layers, of either ashes, road-scrapings, fine soil, stifle-burnt clay, charred turf, &c. The compost to be turned occasionally and well mixed together till it is fit to drill in at seed-time. The outlay in trying this plan would be small; the labour being light, might be performed by women and boys. How true it is that small things are neglected for those of, apparently, more importance! Men will go into the market and purchase at an extravagant price what is called "a foreign manure," because it is a novelty, and recommended as a panacea for all the wants of agriculture. True guano is useful as a forcer if applied judiciously, that is, covered up in the soil in dry weather, or if sown broadcast, the operation should be performed in rainy weather. It must be generally known by this time that more than one half the guano sold in this country is nothing but a villanous compound manufactured at home, and worth about 30*s.* per ton, as far as the expense of making goes; but really of no value to the farmer, who fancies he is dressing his land with genuine stuff—finding out too late, by the slow progress of his crops, how shamefully he has been deceived. By a system of management (in having every description of refuse collected in the farm-yard, to be trodden down or introduced into the pigsty), it is astonishing how soon a rich heap of manure may be formed, a fair coating of which on tenacious land will last three years, and beat chemical mixtures out of the field. Muck should be ploughed or dug in as soon as possible after carting from the yard. *Falcon.*

Leicester v. *Cotswold, as a cross for the Cheviot. To Major Mc Inroy*:—In the pages of this paper you and I some little time since discussed the merits of our sheep stock—you preferring the Leicester ram and Cheviot ewe. My inclination was, and firmly remains, in favour of the Cotswold ram and Cheviot ewe; the occasion of my now reviving the subject is to afford not only you, but any other readers of the *Gardeners' Chronicle* something really tangible as regards the superiority I claim for my advocated cross. From arrangements lately made, it suited me to dispose of my store ewes and some other stock bred here; consequently I had an auction on the 12th of last month, and though some of the ewes are getting somewhat ancient, yet 40*s.* was the lowest, and 43*s.* 6*d.* the highest price I obtained; 23*s.* 6*d.* average of the ewe lambs; 22*s.* 3*d.* average of the wether lambs. My wool, this last clip, did not reach 9 lbs.; but it is all weighed, and exceeds 8½ lbs. each sheep. I am quite satisfied that if we cannot unite in opinion as to the sheep cross now alluded to, in this sentiment we shall cohere, that it is the duty of every one to endeavour, in passing through life, to do some little good to his fellow-creatures, especially to those engaged in similar pursuits; and under the influence of these feelings, allow me to add, that if you can remove me from the vantage ground I claim, I ask you, as one of the active members of the "Fettercairn Farmers' Club," to do so. P.S. You once alluded to my having climatic advantages over you; the reverse, I imagine, is the reality here—1100 feet above sea level is an awkward feature against me in this matter. *George William Fowler, Prince Hall, Dartmoor, October* 6.

Anbury, and Running to Seed.—I have noticed for several weeks past much correspondence and discussion in your Journal, respecting tap-rooted plants, such as Parsnips, Carrots, Turnips, &c., deviating from their usual styles of growth, and becoming deformed, or in other words forming toes and fingers. None of your correspondents seem to have arrived at any definite conclusion as to the cause and reason of it, nor do they seem to have adopted any likely means for its prevention. I have been a seed-grower on a small scale for the last 40 years, and have tried a variety of experiments on various crops, as a means of arriving at some definite and, if possible, satisfactory conclusions in reference to the present unsettled question. My conviction is, that the fault lies in a great measure with the seed-grower, and not with the seedsman or the cultivator of the crop, however much the land may be prepared or adapted to the crop it is intended should grow upon it. My reasons for so thinking are, that I have found it to be highly essential in growing the seeds of umbelliferous and cruciferous plants, such as those above mentioned, as well as all others of the Brassica tribe, that to prevent the production of monstrous and deformed roots, it is necessary as soon as the umbels and heads of bloom are formed and the blossoms begin to expand, to go over them and cut out the central umbels and spikes, either with a pair of scissors or a sharp knife, allowing the remainder or lateral umbels or shoots to absorb the nourishment which would be otherwise consumed by

the leader, perfect their growth and produce their seed. The sap is thereby more equally divided, and instead of having seeds of various sizes, it becomes more equalised, and is invariably productive of a better and more regular crop, both as to shape, size, and quality. I am confident that if seed-growers in general were to pay more attention to this particular item, in their practice, there would be fewer causes of complaint, and consequent better feeling, with less discussion, existing amongst them respecting such matters. My attention was first called to this particular point by my foreman, some years since, who had conceived an idea that if he saved seed from the central umbels of a piece of Parsnips which had been planted for that purpose he would be enabled to grow and produce some Parsnips which "would astonish the natives," and, consequently, did so, from some of the finest of them, which was sown in a bed adjoining the general crop the ensuing season; when, to our mutual surprise, there was not a handsome, hollow-crowned, tapering root produced amongst them, although the land had received an equal amount of dressing and preparation with the rest; the roots were clumpy, forked, fingered and toed in every variety of deformity. The result of this experiment led me to try others, and I have invariably found the practice which I now advance to be correct, and without any desire but that of serving those who feel interested in the matter, have no hesitation in pronouncing the idea to be correct, both theoretically and practically. With Turnips I have been equally successful. I had a bed of the variety known as "Jersey Navets" last year, the produce of seed saved from plants, from which the central shoots had been removed at the time before specified, which were as true as it was possible for them to be throughout, not a deformed or a discoloured root appearing amongst them. If the practice stands good in reference to particular varieties, it is also so in reference to the genera. I have not known it to fail in any case where a fair trial has been given to it. *Bernard Saunders, Jersey, Oct.* 12.

Moral and Intellectual Improvement in Rural Districts.—An inhabitant of a country village in an agricultural neighbourhood is desirous of establishing a weekly evening meeting, for the advancement of the moral condition of the labouring classes, uniting, if possible, amusement with instruction; in fact, of such an enticing character as to wean them from their favourite resort—the ale-house. In towns there are societies of this nature for a better educated class, known as the "Mechanics' Institute," and your subscriber would feel much obliged to any of your readers who may have had experience in the management of such societies, and would kindly offer a few suggestions for the establishment of an institution adapted for the hard-working plodding peasant. The poor man, at times but ill supplied with the common necessaries of life, who toils from sunrise to sunset to support his family, and not unfrequently a sickly wife, requires some occasional recreation of an intellectual nature, calculated to humanise him, as it were, and to raise him above the mere animal, which, after working all day, comes home, eats and drinks, and then sleeps till the peep of morn awakes him, only to resume his wonted labours. While, by means of our schools, we inculcate moral and religious principles, and instil a desire for mental improvement into the infant mind, should we not also provide some means of nourishing the lambent flame thus kindled in the youthful breast—but which, alas! is too often extinguished in maturer years by rude hardship and the chilling breath of poverty? Much has been done of late to curb the prevailing sin of the poor—an inordinate indulgence in intoxicating drink; but let us not rest satisfied with skimming the surface, while we leave the root of the evil rankling at the core; can we not strike still deeper, and, by cultivating the crude soil of the human heart, diminish the taste for such low pursuits? The country gentleman may expostulate in bitter terms against the vices of his humbler brethren, and forbid his cottiers to pass the threshold of the public-house, but will all this suffice? *Constance.*

On Premiums to Farmers.—There must be something radically wrong when it is necessary to hold out premiums to induce a man, or a set of men, to adopt a better mode of management than that which they at present adopt. Do those who offer the premiums wish to participate in the advantages which they think will be the result of the change? And do those to whom the premiums are offered think this is the case? Or are those people, to whom the premiums are offered, so ignorant or so prejudiced to old customs that they are blinded to their own self-interest? It is evident that those who offer the premiums expect that they will have a considerable effect in directing the mind of the farmer to inquire into and probably to adopt such a line of practice for the future as may secure all the advantages which may naturally be calculated on. Self interest is the grand moving principle of every man's conduct, and this has a much greater influence on him than any premiums; he will only compete for them if he feels that it will be more to his advantage by doing so than by not doing it. There have been no premiums held out to manufacturers, and yet the wonderful results which have followed the improvement in all the manufactures that have been made during the last 50 years is the fruit of a conviction that each of the new inventions will pay all those liberally who use them; but it is otherwise with agriculture; a continual succession of premiums have been awarded to farmers during this century, and yet how very little advantage has the agriculture of the country been benefited by it. Does not this show that there is something wrong in this mode of trying to improve agriculture by awarding premiums, or that there is some other thing which prevents the farmer from adopting the improvements? It may be that there are circumstances under which the farmer is placed which require to be altered before he is placed in the same position as the manufacturer, so as to induce him to take advantage of, and adopt every new improvement in agriculture which the object of the premium is intended to produce. Should not the prizes be offered for the whole of the farmer's stock, or for the management of the whole of his farm, instead of only for the best beast, the best sheep, or for the best dozen of Turnips, &c.? so that no prize be awarded but to that which shows the greatest profit as the result. The landlords and their tenants are much more borne down by custom and prejudice than any other class of men. If an intelligent and scientific man be a farmer, he is hampered in his mode of proceeding by his landlord preventing him from going out of the custom of the country. "The land must be farmed according to the custom of the country," is a clause in almost every agreement or lease between the landlord and his tenant; and the intelligent and scientific landlord has ignorant and prejudiced tenants to deal with, so that where the one is anxious to improve, the other prevents him from doing so, either by ignorance or by some of those circumstances which bear peculiarly on land, landlord, or tenant. The present mode of letting farms by the year certainly does not tend to promote the improvement of agriculture or the permanent improvement of the soil; indeed the want of security for the money expended in improvement, and the injury he sustains by game, prevent the farmer from entering on any expensive improvement. It cannot be expected that a man will lay out 6*l.* or 8*l.* per acre to improve the farm from which he may be expelled at half a year's notice, to the certain loss of every sixpence which he may have expended, nor will he be very anxious to adopt an improved mode of culture if it be more expensive than the one he at present adopts, as the improvement may be for the advantage of his successor, and not for himself! These are the great drags to agricultural improvement. The farmer, investing his capital in his farm, surely ought to reap the use of the farm for such a time as will enable him to recover the principal and interest of the money he has sunk in the improvement; the risk he runs is great, and he should have a certain time to recover the capital he has expended. Landlords may rest assured that if they will not grant a lease for terms of a proper length, with power over the game on it, they must either be at the expense of improving their land themselves, or let the land remain as it is, for farmers will not expend their capital on another's land without some security for it being a profit to them. *J. M.*

Italian Rye-grass in Scotland.—The *Agricultural Gazette* is very lively on the subject of Italian Rye-grass, and Mr. Caird has got into hot water. I wish you had been able to come to Scotland to see the crops of Italian Rye-grass both at Mr. Telfer's and Mr. Kennedy's; they are truly wonderful. Mr. Telfer's 50 cows could not consume his seven Scotch acres of Italian Rye-grass; that is a fact. His Mangolds and Cabbage are astonishing. Mr. Kennedy's 460 sheep in one house, divided into rows of six or eight, is a beautiful sight, and four months is the time, so that during the year three times 460 are fatted off. In five months the Italian Rye-grass of one acre feeds 70 sheep; that is, the circle of cuttings of a certain number of acres feeds these 460 sheep at the rate of 70 per acre; I believe it is the Scotch acre. The pig-headed incredulity of some persons is marvellous. It might have been well if the editor of the *Mark Lane Express* had gone to see Mr. Telfer's farm. *A well-known Correspondent in the County of Ayr.* [We guarantee the exactness of this statement.]

Osiers.—Having been for a number of years conversant with the cultivation of twigs (Osier), I have of late been much puzzled as well as incommoded by the failure of a plot of from 10 to 12 acres, most advantageously situated in a marsh, and which have for 30 years previously been most productive and lucrative. For the last two years I have had very fair growth on parts of the beds, other parts yielding but a sickly growth, not at all encouraging to the grower or buyer. May I therefore beg to inquire of your numerous correspondents and readers, whether a similar failure has come under their notice, and, under the circumstances, what course they would advise for the regeneration of the twig, which forms an humble but important item in our domestic and farming economy? *J. S. Perkins, Cahir.*

Autumn Cleaning of Stubbles.—The autumnal fallowing of lands that are intended to be planted with green crops during the following season, is a recent introduction into the practice of agriculture, and under favourable circumstances is attended with a very considerable advantage. The land being wholly or partly cleared of weeds in autumn, and the soil being completely or partly pulverised, a very large furtherance is given to the spring work of the next season. The north of England and the whole of Scotland do not generally allow the introduction of any autumn fallowing of the ground. September is the general harvest month, and after that time any entertainment of the process is absurd. The climate is so very uncertain, and in many places so severe, as to demand the whole attention in securing the crops, leaving to the next year the work that belongs to it. The best Turnip soils in Britain are thus excluded from being autumn fallowed; but the opposite advantage is enjoyed of a cooler nature in the land, and more frequent rains, with which to secure the crop of Turnips in the proper season. The exposure of the lands during the driest season of the year by the repeated ploughings and two drillings, dissipates the moisture, which is amply repaid by the dews and frequent rains of these climates, and by the humid constitution of the soil itself. In South Britain the moisture being once lost is never recovered during that year, as the rains are few and distant, and the dews none. Hence the different system that must be used in growing Turnips; the dung must be covered in broadcast, and the Turnips sown on the flat ground by means of machines with lengthened coulters to make ruts for the deposition of the seed. This method has arisen from the dryness of the climate, which evaporates the moisture during the frequent stirrings of the ground in the early season. When the soil is cloddy and crumbly the evaporation of moisture is complete, and the surface is dried into an arid dust in which no seeds will vegetate. The success of the Turnip crops almost wholly depends, in dry climates, on the husbanding of the moisture which the land has gathered during the winter. If this be lost without a source of recovery, the chance of a crop becomes a most precarious expectation. The retention of moisture is considerably increased by the autumn fallowing of the ground—the spring stirrings of the land are lessened, and the exposure is much decreased. This is a vast advantage, and forms a value not to be estimated in the case of South Britain, where the Turnip soils are shallow and hot, and the climate dry. Autumnal fallowing has been devised to yield this advantage, and it cannot fail to produce the results of its merit. *J. D.*

Swedish Turnips.—I send you, at the request of Messrs. Charlwood & Co., of Covent Garden, six bulbs of Swede Turnips, grown from seed bought of them, which are a fair specimen of about 5 acres of Turnips. The soil is partly clay and partly gravel, with a mixture of chalk in parts. The Turnips came up well, but fell off in August, after the second hoeing. They were drilled in about the 8th of June with 20 bushels of ashes and 2 cwt. of Lawes' superphosphate of lime; the land had been dunged partly in November and partly in February. The previous cultivation of the field was as follows:—1850, Turnips, a very good crop; 1851, Barley and Clover; 1852, Clover; and 1853, Wheat. In an adjoining field (the soil rather better), I have an excellent crop of Mangolds, and a few Turnips sown among them, from vigorous seed, are very good. *James Currie, Hillside, Watford.* [It is just an ordinary case of "anbury," or "finger-and-toe" disease.]

Tank and Hose.—I am a small man desirous of following in the wake of the great Mr. Mechi, and command showers of manure rain upon my farm whenever my wisdom suggests the probability of the agreeableness of an invigorating draught to my liquid-loving vegetables. My farm consists of one acre, cultivated by the spade, and devoted to the growth of Italian Rye-grass, &c., &c. On its confines are my stable and cowhouse, with paved floors, and capabilities for washing them frequently into a tank, into which also flows the sewerage from my house; I have also the command of water for dilution. The problem I require solving by some of your experienced readers is, to what height ought I to pump the liquid into a tank (railway station like) to permit the ready distribution by the hose and jet? *Small Scale.*

Societies.

LOGAN, WIGTONSHIRE.—On Thursday week, the harvest having been most successfully completed over the home farm at Logan, consisting of 1600 acres, Colonel M'Douall invited his tenantry on the Logan estates to participate with him and his labourers in the festivities of this joyous occasion. Colonel M'Douall presided over the feast, and was ably supported by Major Maitland and Mr. M'Culloch, Auchness, as croupiers. After the usual loyal toasts, in proposing which Colonel M'Douall spoke from his own knowledge of the high proficiency of Prince Albert as an agriculturist, he, in returning thanks for his own health, proposed by Major Maitland, gave "The Tenantry of the Logan Estates." He stated that it was matter to him of great gratification that he could number among his tenantry some who had taken a lead in the agricultural improvements of the day, and whose practice had been deemed not unworthy of being held up as an example of high farming to the country. In his own case, on the home farm, he had found the carrying out of this principle eminently successful, the increase of his crops and the number of the stock now maintained, as compared with an earlier period of his experience, being prodigious. While his land was thus made the means of increasing by so much the annual supply of food, it afforded him also the very pleasing reflection that he was year after year providing an enlarging and remunerative source of employment to the intelligent and well-conducted labourers on his property. He took no credit to himself for this, for unless the labour was remunerative, he would have no satisfaction in the expenditure he was making, nor indeed could he or any landlord afford to continue it. But when well directed, he had found his labour-bill one of the best investments of his farming capital. He had great confidence, therefore, in the principle of agricultural improvement, and felt that in the hands of such a tenantry as he had the pleasure of seeing round him, he could safely commit the management of his estate, and, through them, the welfare of all those who were so much bound up in each other's prosperity. (Loud cheering.) In returning home from the

active duties of his profession as a soldier, to which he had been devoted for 35 years, it was his earnest hope that now, as a resident proprietor, he might have more frequent opportunities of personal intercourse with his tenantry, and of co-operating with the gentlemen of the county in the public business of the district. Col. M'Douall concluded by proposing the "Tenantry on his Estates." —Mr. M'Lean, tenant of the farm of Mull of Galloway, in acknowledging the toast, congratulated the gallant colonel on his return to reside among his tenantry, and on the vast improvements which had been made on the Logan estates, and especially on the enterprise and skill employed in the home farm, where the numberless stacks of grain attested the success of the system, and surprised and almost bewildered even extensive farmers. The tenantry were proud to be on an estate which had furnished examples of high farming that had given an impetus to agricultural improvement over the whole country. And if, as he trusted, this country should progress at the same rate for the next quarter of a century as it had done the last, then he would not hesitate to prophesy that Britain would be an exporting instead of an importing agricultural country. This great change had been chiefly, if not altogether, brought about by draining, improved cultivation, and the liberal application of manures. As a practical farmer, he would fearlessly assert that on the great majority of farms in this country no man should talk of impossibilities who did not expend an amount equal to his rent on genuine guano and other fertilising substances. To enable the British farmer to use this valuable manure in greater abundance, the exertions of Mr. James Caird to cheapen the price and procure an ample supply deserved the heartfelt thanks of the agriculturists of the country. With a plentiful supply of cheap manures, the example of the Laird of Logan, and the doings at Auchness before their eyes, the periodical cry of agricultural distress would be got rid of, and the vaunted liberality of some landlords in doling out a return of so much per cent. of rents to their tenantry would no longer be needed. That was necessary only where the tenants were over-rented. It was an indication that the last penny had been so completely screwed out of a tenantry, that they had no margin for casualties. On the Logan estates these paltry deductions, thanks to the enlightened policy of the respected landlord and his doers, were not wanted. Here, he was glad to say, the tenants did not live from hand to mouth. The system was live and let live. *Abridged from the Ayr Observer.*

Miscellaneous.

On the Results of Experiments on the Preservation of Fresh Meat. — This inquiry was undertaken with a view of discovering a method by which beef could be brought in a fresh state from South America. The experiments were made by inclosing pieces of beef in bottles containing one, or a mixture of two or more, of the following gases :— chlorine, hydrogen, nitrogen, ammonia, carbonic acid, carbonic oxide, and binoxide of nitrogen. Of these, the last two only possessed the power of retarding putrefaction. Beef that had been in contact with carbonic oxide for the space of three weeks was found to be perfectly fresh, and of a fine red colour. Binoxide of nitrogen is capable of preserving beef from putrefaction for at least five months, during which time the beef retains its natural colour and consistence. When meat that had been preserved by the last process was cooked by roasting, it was found to possess a disagreeable flavour. If cooked by boiling, the ebullition must be continued for a much greater length of time than is necessary for fresh meat. *Mr. G. Hamilton at the British Association.*

Minasi's Artificial Incubator.—Every one possessed of a knowledge of the circumstances under which the natural hatching of eggs is effected, will be aware that a steady heat of a suitable temperature, maintained for a certain number of days, and a sufficient quantity of fluid to supply the place of the aqueous exhalations which pass off from the egg during incubation, are necessary to the success of any attempt to produce the chick from the egg in a healthy and natural condition. In order to supply these, Mr. Minasi constructs a water-tight case or tray of zinc, of about 1 inch in depth, and fills it with water, which is maintained at such a temperature that a layer of fine sand placed on the upper surface of the case is constantly kept by it at about 107° Fahr. Upon this layer the eggs to be hatched are placed, and covered with a sheet of glass or other suitable substance. In order to furnish the vapour necessary to compensate for the aqueous evaporation from the egg, which, if allowed to proceed to a great extent without any counteracting action, would lead to the destruction of the chick *in ovo*, the inventor arranges in the incubator a number of short tubes, extending from the under side of it to the upper, and reaching above the layer before mentioned, so that atmospheric or other moisture may pass up from beneath and distribute itself over the whole of the surfaces of the eggs. The lamp employed is fitted with certain improvements, also effected by Mr. Minasi, by which naphtha is burned, without the use of a wick, so as to keep up a constant temperature for several weeks without any attention ; and in order to economise the heat obtained from the lamp, the former is made to traverse a spiral flue, to the sides of which a portion of it is continually transferred, a minimum quantity passing off through a pipe opening into the atmosphere. The heat transferred to the flue, as just described, is communicated to the water ; and by the simple expedient of raising one end of the incubator, a continual circulation of the heated water is kept up throughout it. The under side of the zinc case is corrugated, in order that the chicks which are reared in a chamber, of which it forms the upper part, may the better nestle against it. We have seen about 150 chicks, hatched and reared by this apparatus, from two hours to 10 weeks old, which were in an exceedingly good condition. *Mechanics' Magazine.*

Calendar of Operations.

OCTOBER.

Border of the Fens, *Oct.* 16.—We may give every three or four weeks an account of the more important events that occur on the farm as the "seasons" roll on, with such local variations as soil and climate call forth; but how many more incidents might be recorded subordinate to seed-time and harvest in the experience of every farmer, which, if duly noted, would form a series of interesting autobiographies that, truly narrated, would astonish the uninitiated, and surprise even a practical man who had bestowed consideration only on the little circle of his own affairs. How many circumstances, for instance, belonging to an unprecedented dry season, find agriculturists unprepared; their meadow or marsh land fenced by dikes or drains become like any common—open to the incursions of their neighbour's stock; with wells and ponds dry; tun-carts and water casks are barely sufficient to convey water from a distance for all ordinary uses; ploughs cannot penetrate the Clover leas even at the expenditure of a share a day to each plough, except on fen or light soils, where it is so dry and dusty that we must wait for more rain before we commit our Wheat to the earth. Live stock are foddered a month or two earlier than usual; Turnips are mildewed; Coleseed is short and "foxey;" pastures are bare; Linseed-cake, 12*l.* to 13*l.* a ton in October—what will it be at Christmas? These are peculiarities of the season; other cares may occur at any time. I hear of one neighbour losing a colt from cold or inflammation; another losing a valuable mare; here is one of the best cart horses put *hors de combat* from a neglected chafing in the shoulder or a puncture in the foot; one provident friend comes to borrow five or six dozen sheep-trays; another asks the loan of a capital grubber you have just purchased—"he has only got two horses to draw it, and they can't hurt anything;" one man takes a dozen "gates" of water daily from your pump, which you expect to be nearly dry, whilst, by going a couple of hundred yards further off, he might get any quantity from the river. One morning your shepherd finds a sheep too many among 50 lamb hogs ; it turns out to be a scabbed ewe, of which you had no notice, other than discovering it had been "lined," and that there were three or four "knots" of the disease about its shoulders; it had crept through a hedge during the night, you can scarcely tell where or how, and you do not feel very charitably disposed towards the man who has done you this injury. A friend of mine has suffered severely this autumn on this very account; and the worst is that he may yet suffer more, by seeing a valuable stock spoiled, or being compelled to part with them on the worst terms. How many conditions require to be fulfilled in keeping your horses up to the mark ; not only a fair allowance of corn, but sufficient Clover or hay, with no waste, even of chaff; litter also to be provided at proper intervals; young stock to have access to water; sheep require frequent change of pasture, and to be well looked after, lest some of them "scour," or get blown, or "fled," or lame, or otherwise disordered. No general rules will meet the thousand contingencies that may be best surmounted or turned to advantage, or brought to a healthy state and ordered aright only by the daily vigilant inspection of a master. Who else can, at a short notice, when one operation cannot be proceeded with, turn easily all the forces into another channel?—sending some to clear a yard of litter and pulse after threshing, or secure the straw stack, others to cart wood for fencing, fill up ruts or holes in the roadways, clean "Quicks," repair drains, draw Nettles or Thistles, burn rubbish, destroy rats or vermin, some to dress or dispose of "tail" corn, gather and place in order empty sacks and clothes, grease carts and waggons, look over the harness and small tools of all sorts; others to soak grains, or bran, or malt-comb for pigs, wash and boil roots, and sort out Potatoes—so multifarious are the calls upon the one or two men employed in these odd jobs, that in the most orderly homestead there is generally room enough for help when weather or unforeseen accidents throw the hands out of gear. We are now threshing a little corn every week, ploughing when we can, clearing land of weeds as fast as the stubble is cut and carried, and taking up Potatoes, the yield of which is generally about 80 sacks, of 16 stone per acre, nearly all good and serviceable, the diseased not 1 per cent., the small not above 8 per cent.; sold as they are raised, 5*s.* per sack, or picked, at 6*s.* to 7*s.* We are preparing to take up Carrots, which are a good crop, and Mangold Wurzel, which are rather small. Showers are becoming more frequent, so that we may soon expect to get the main part of Wheat seeding done; we do not intend putting so much seed in as heretofore. A sight of Mr. Mechi's crops will testify to what may be done with a less quantity of seed than is customarily used, the chief condition required being land in a good state for the seed, so that it may be sustained, without being stimulated, regularly during each period of growth; we shall, nevertheless, proceed with abundance of caution, diminishing the quantity of seed, but not to the minimum prescribed by amateurs and crack capitalists, whose success may in many things justify imitation or partial adoption of their plans, but be sure to keep on the safe side, and not have to lament at harvest time over the ravages of slugs, crows, or wireworms, which make such inordinate gaps in the expected profits of some of the very oldest-fashioned of farmers. One thing we do not mean to do this year, viz., till fen land for Wheat after seeds; we did it last year, thinking to destroy a few root weeds that bothered us, but the land was thereby rendered unusually light, and, we suppose, made it more accessible to the severe frosts which occurred last spring; at all events, great damage was done by the frost in April to that field, while other pieces of Wheat entirely escaped about which less care was taken. *J. W., Peterborough.*

Notices to Correspondents.

Horse Power: *Alpha.* More power is lost in the endless chain power than in the "sweep" or ordinary "power." As to your other question we simply print it:—"Will you ascertain whether Mr. Dickenson has other plans than those mentioned by you some years ago for obtaining his large crops of Italian Rye-grass?"

Iron Granaries: *C J P* asks whether iron granaries are to be procured in London, and if so whether they have ever been used, and the result, whether satisfactory or not. Also whether an iron granary could be put up, to hold, say 100 sacks, at a lower price than one of brick or wood. Any information on this subject will be thankfully received.

Malt: *J W R.* It is legal, we believe, to sprout Barley for feeding our own cattle. But you had better inform the exciseman in your neighbourhood of your intention.

Profitable Cows: *A Subscriber of many years.* Can the writer, who signs *T G.*, October 7, mention the kind of cow which has been thus unusually profitable?

Erratum: *F G.* Thanks. In p. 669, col. *a*, the £ *s. d.* column from the word Piece-work in the middle of the column down to 0 8 0 ,, 0 12 0 inclusive, has slipped one line downwards, which must be corrected in reading. In p. 667, col. *a*, in line 31 from the bottom read—"but I will state *them*:—When 7 to 10 crops," &c. ("and it shrinks," &c.) "it may be conceived," &c.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water ; Fire Engines, &c.

WEIR'S DRAINING LEVEL, Price 30*s.*

These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.

Edward Weir, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

Messrs. Burgess and Key, as Mr. Parkes Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

HOSE PIPING.—Great Reduction in Price.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.

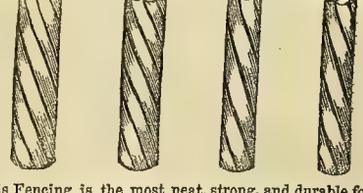
BURGESS and KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, Hydraulic Engineer, 70, Strand, and Bridgefield, Wandsworth.

H. J. MORTON and Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Park and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. Archer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

N.B.—The advantages of these Hand-Glasses are—

1st. *Saving in Packing and Carriage*, being so contrived as to be readily taken to pieces and packed in a small compass.

2d. *Glazing without Putty or Glazier*—the Glass being fixed in grooves in the iron frame.

3d. *Facility for Ventilation*—the two top panes being made to slide up and down at pleasure.

4th. *Durability and Solidity of the Frames*—which are made of wrought iron.

JAMES PHILLIPS and Co., Agents for above, 116, Bishopsgate Street Without.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, 296, Oxford Street, London.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt.

HARTLEY'S PATENT ROUGH PLATE, for Roofing Conservatories, Halls, and Public Buildings.

PLATE, CROWN, and SHEET WINDOW GLASS.

Coloured and Ornamental Glass of every description.

Glass Milk Pans, Pails, Tests, and Measures; Cream Pots and Syphons; Churns, Butter Tests and Slabs; Tiles and Slates; Bee Hives, &c.

Moore's Patent Ventilator and Lockhead's Patent Perforated Glass, for Dairies and Greenhouses.

Aquavivariums, Fern Shades, Propagating Glasses, Fruit Protectors, Preserve Jars, Cucumber Tubes, Hand Lights, Flower Vases, Labels, &c., and all kinds of Agricultural, Horticultural, Architectural, Domestic, Scientific, and Ornamental Glass, British and Foreign, at the lowest prices.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, ENGINEER, Battersea.

E. ELEY'S HOT WATER WORKS, and improved Hot Air Works, opposite the Eagle Tavern, City Road, London. Manufacturers of the various descriptions of HOT WATER APPARATUS for Heating Horticultural Works, Churches, and other Public Buildings, Mansions, Offices, Baths, &c., on the most scientific principles. Manufactories requiring artificial heat fitted up with effective and economical apparatus by contract or otherwise. Old work taken down and remodelled. Architects, Surveyors, and the Trade attended to in any part of town or country.

E. E. being a practical and scientific workman defies competition. Parties by sending a rough sketch of their building can be supplied with the most improved Pipe Boilers, or any other description, with connection and piping fitted and marked with a plan, cement, &c., for joints, so that a gentleman's own tradesman or gardener can fix them.

N.B. Please to observe the Address. No connection with any other House in the Trade.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea.

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHER, Millbank Street, Westminster.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

THE CRYSTAL PALACE FLOWER BASKETS, as exhibited in Nave and Transepts of the Crystal Palace, Sydenham, made to the original and other new elegant designs, by W. RICHARDS, at the Wire Works, 370, Oxford Street, nearly opposite the Princess's Theatre. Conservatories and Aviaries fitted up. Wire work in all its varieties. Game and garden fence—parrot cages and all others. Choice birds kept on sale. Window blinds of every possible description, of the very best materials and workmanship.

N.B. An allowance to nurserymen and the trade.

TEN THOUSAND STOVES.

THE TENTH THOUSAND OF THE PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, AND CO., 46, King William Street, London Bridge; and may be obtained of most Ironmongers.

The IMPROVED PATENT VENTILATING STOVE, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded post free.

FLAVEL'S PRIZE KITCHENER.

THESE RANGES are strongly recommended for their simplicity of construction and their economy and cleanliness in use. The top forms a Hot-plate, and the open fire removes many of the objections which are felt to close Ranges. They are made in all sizes, from 3 feet to 18 feet in width, suitable for large or small establishments. They are admirably adapted for the Cure of Smoky Chimneys.

London agency removed to Wigmore Street, from 92, Jermyn Street, Piccadilly.

BENHAM & SONS, 19, Wigmore Street, London.

And in the Hardware Court of the Crystal Palace, Sydenham.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

PAPIER MACHÉ AND IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

New oval Papier Maché Trays, per set of three	...	...	...	from 20*s.* to 10 guineas.
Ditto, Iron ditto	...	...	...	from 13*s.* to 4 guineas.
Convex shape, ditto.	...	...	...	from 7*s.* 6*d.*

Round and Gothic Waiters. Cake and Bread Baskets equally low

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are now ON SHOW in one of his TEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz. from 12*s.* 6*d.* (two lights) to 16*l.*

LAMPS OF ALL SORTS AND PATTERNS.—The largest, as well as the choicest, assortment in existence of FRENCH and ENGLISH MODERATEUR, PALMER'S, CAMPHINE, ARGAND, SOLAR, and other LAMPS, with all the latest improvements, and of the newest and most *recherché* patterns, in ormolu, Bohemian, and plain glass, or papier-maché, is at WILLIAM S. BURTON'S, and they are arranged in one large room, so that patterns, sizes, and sorts can be instantly selected.

Real French Colza Oil, 4*s.* 6*d.* per gallon.

Palmer's Candles, 9*d.*, 9½*d.*, and 10*d.* per lb.

DISH COVERS AND HOT-WATER DISHES in every material, in great variety, and of the newest and most *recherché* patterns. Tin Dish Covers, 6*s.* 6*d.* the set of six; Block Tin, 12*s.* 3*d.* to 28*s.* 9*d.* the set of six; elegant modern patterns, 34*s.* 0*d.* to 58*s.* 6*d.* the set; Britannia Metal, with or without silver-plated handles, 76*s.* 6*d.* to 110*s.* 6*d.*; the set; Sheffield Plated, 10*l.* to 16*l.* 10*s.* the set; Block Tin Hot-water Dishes, with wells for gravy, 12*s.* to 30*s.*; Britannia Metal, 22*s.* to 77*s.*; Electro-plated, on Nickel, full size, 11*l.* 11*s.*

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

39, OXFORD STREET (corner of Newman Street); Nos. 1, 2, and 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES. — METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, by METCALFE, BINGLEY, & Co.'s only Establishment, 130B and 131, Oxford Street, second and third doors west from Holles Street.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as highly conducive to health and longevity. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTIFRICE, stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, it will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the teeth firmly in their sockets; and from its aromatic influence imparts sweetness and purity to the breath.—Price 2*s.* 9*d.* per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by chemists and perfumers.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

NERVES.

DR. GRANDISON'S PILLS for strengthening the Nerves are sold in London by Mr. RICHARDS, 40, New Bridge Street; Mr. SANGER, 150, Oxford Street, and other respectable Chemists. Boxes can be sent by post.—Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 4*s.* 6*d.* each.

NERVOUSNESS.—A gentleman having come into possession of valuable receipes for the cure of Nervousness, Female Complants, and Consumption, will be happy to forward them gratis on receipt of a directed stamped envelope.—Address, Mr. D. OFFORD, 67A. Great Russell Street, Russell Square, London.

DR. DE JONGH'S

LIGHT BROWN COD-LIVER OIL, PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS, THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM, AND ALL SCROFULOUS DISEASES.

Approved of and recommended by BERZELIUS, LIEBIG, WÖHLER, JONATHAN PEREIRA, FOUQUIER, and numerous other distinguished Scientific Chemists, prescribed by the most eminent Medical Men, and supplied to the leading Hospitals of Europe—effecting a cure or alleviating symptoms much more rapidly than any other kind.

Extract from THE LANCET, *July* 29, 1854.

"After a careful examination of the different kinds of Cod Liver Oil, Dr. de Jongh gives the preference to the Light Brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod Liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. In the preference of the Light Brown over the Pale Oil we fully concur.

"We have carefully tested a specimen of the light brown Cod-liver Oil prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. ANSAR, HARFORD, & Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by

ANSAR, HARFORD, AND CO., 77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and the British Possessions, and may be obtained from respectable Chemists and Druggists in town and country, at the following prices: IMPERIAL MEASURE, half pints, 2*s.* 6*d.*; pints, 4*s* 9*d.*; quarts, 9*s.*

*** Four half-pint bottles forwarded, CARRIAGE PAID, to any part of England on receipt of a remittance of Ten Shillings.

MONMOUTHSHIRE.

TO BE LET, for a term of years, and entered upon at Lady-day next, the FARM of LLANVAIR GRANGE. It consists of 164 acres of rich productive Land, of which 4 acres are in Orchard, 76 in Meadow and Pasture, and 84 are Arable. There is a comfortable Farm-house and Garden, Dairy and Cheeseroom, and ample Farm Buildings on the Farm. It is within a short distance of the Pontypool Iron Works; there is a station on the Newport and Hereford Railway close by. At the Iron Works there is a constant demand for every kind of Farm produce. The proprietor at Llanvair Grange will direct some one to show the Farm; and for particulars apply to Mr. JOHN MORTON, Morningside, Nail-worth, Gloucestershire.

WHITESTONE, DEVON.

VILLA RESIDENCE AND LAND, THREE MILES FROM EXETER, WITH EXCLUSIVE RIGHT OF SHOOTING OVER 500 ACRES.

TO BE LET, with immediate possession, HURSTON HOUSE, standing in an extensive and well-wooded Lawn, with two Entrance Lodges, large Walled Garden, Coach House, and Stabling for six horses. Also for a term of 10 or 14 years, the undermentioned farms, either together or separately:—

HURSTON FARM, containing 120 acres of most productive Orchard, Meadow, and Arable Land.

BARTONS, containing 45 acres of Pasture and Arable Land.

PITT FARM, containing 40 acres of Meadow, Orchard, and Arable Land, with a good Farm House.

KINGWELL, containing 57 acres of Meadow, Orchard, and Arable Land.

DYMONDS, containing 91 acres of Meadow, Orchard, and Arable Land.

The land-tax on all the land is redeemed except Dymonds. All the lands lie nearly within a ring fence, and are in a good state of cultivation, having been farmed by the owner for many years. Tenders in writing, stating a clear rent, to be sent to Mr. LAMBERT on or before Friday, the 27th of October, 1854. The Hind at Hurston will show the premises, and for further particulars apply to Mr. S. DAY, Auctioneer, Culver Farm, near Exeter; or to Mr. LAMBERT, Solicitor and Proctor, Exeter.

CHELMSFORD, ESSEX.

TO BE LET, on Lease, a highly-productive and well-stocked NURSERY GARDEN of about 2 acres, close to the town, with excellent Fruit Walls; Pump, and Reservoir of Water; the erection of a Forcing-house, Pit, and two Sheds. The Nursery Stock now on the ground to be taken by valuation. The rent will be unusually moderate.—Apply to VALPY & STOKES, Auctioneers, Chelmsford, Essex.

TO BE LET, by tender, a FARM on HAFODUNOS ESTATE, North Wales, comprising 328 acres, great portion of which has been thoroughly drained, sub-soiled, and highly improved, and the remainder is now being similarly treated. The House will be altered and additional buildings erected to suit the tenant. Hafodunos is 9 miles from Abergele, 6 from Llanrwst, 10 from Conway, and 13 from Denbigh.—Application to inspect the farm to be made to Mr. SCOON, Bailiff, Hafodunos, by Llanwrst, and further particulars may be obtained from Mr. PALIN, Christleton, near Chester, to whom offers in writing are to be made.

TWO FARMS,

A FEW MILES FROM THE CITY OF CHESTER.

TO BE LET, by Tender, an excellent DAIRY FARM, containing 150a. 2r. 14p., called Rushall Hall, situate in the parish of Tattenhall, in the county of Chester, two miles from Tattenhall Station on the Chester and Crewe Railway, in the occupation of Mr. George Robinson. A great portion of the Farm has been thoroughly drained, and a portion of the Grass Land boned; and it is contemplated to complete the draining and boning of the Farm the ensuing winter. The House is commodious and will be put into thorough repair. The present Farm Buildings will be taken down, and an entire new set of buildings suitable to the Farm erected. Possession of the House on the 12th of May, and of the Lands on the 2d of February next.

Also an excellent DAIRY FARM, containing 156a. 2r. 23p. At present a part of the above Farm is in the occupation of Mr. George Robinson, on which has this year been erected a commodious House, suitable for a highly-respectable family, and the Buildings and Premises arranged with every attention to comfort and convenience. A great portion of the Land has been drained and boned, and the whole that is required will be completed the ensuing winter. Immediate possession may be had of the House, Buildings, and Garden; and of the Land on the 2d of February next.

John Ennion, of Hatton Heath, near to the Turnpike-gate where the road branches to Tattenhall, will show the Farms; and particulars had of Mr. JOHN PALIN, Christleton, near Chester, or at the Office of JOHN PALIN & SON, Westminster Buildings, Newgate Street, Chester, where a Map of the Property may be seen, and offers in writing sent.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

TO BE SOLD CHEAP, STRONG-BUILT GREENHOUSES, 12 feet long 8 feet wide, 15*l.*; 16 by 10, 20*l.*; 18 by 10, 25*l.*; 20 by 12, 35*l.*; 23 by 12 40*l.* Plans and particulars of Mr. SMITH, 1, Lower Road, near Islington Green. Window Blinds, Sashes, Doors, &c., from 6*d.* per foot. Stout Horticultural Glass at 2½*d.* per foot. Orders to all parts.

TO CARDENERS, FLORISTS, AND OTHERS.

TO BE SOLD, a NURSERY and FLORIST'S BUSINESS, with a good connection of Jobbing, &c. The Stock can be reduced to suit the purchaser.—Apply, by letter only, to J. H., 6, Ampthill Square, Hampstead Road.

VALUABLE FREEHOLD NURSERY GROUNDS, ETC., FULFORD ROAD, YORK.

TO BE SOLD, by private contract, the long-established and flourishing NURSERY PREMISES of the late Mr. George Clarkson, situate on the banks of the Ouse, York, comprising about 14 acres of first-rate Nursery Ground, well stocked with Forest and Fruit Trees, Shrubs, &c., and having a substantial DWELLING-HOUSE, SHOPS, and GREENHOUSE, and other requisite Out-buildings attached. The purchaser will have the option of taking the whole or part thereof, and the Stock on liberal terms. Immediate possession can be given, and plans and particulars may be had on application to Mr. LUKE THOMPSON, Solicitor, York.

Sales by Auction.

MR. DOWSETT will Sell by Auction, without reserve, under a Power of Sale on a Mortgage, on TUESDAY, the 24th October next, at the AUCTION MART, London, at 12 o'clock, BINFIELD NURSERY, Binfield Road, Stockwell, Surrey. The Nursery Ground consists of 1¾ acre, walled around; a substantial brick-built Cottage containing five convenient rooms on the ground-floor; and three newly-erected Greenhouses and two Sheds. Held on Lease for the unexpired Term of 80 years, wanting 28 days, from Midsummer last, at a low ground rent of 40 guineas.—Particulars of Mr. THOMPSON, 3, Finsbury Chambers, London; and of the Auctioneer, New Town, Homerton, and Chelmsford

CHOICE AND VALUABLE COLLECTION OF TULIPS.

THE PROPERTY OF THE LATE MR. J. J. JAQUES.

MR. ALEXANDER is instructed by the executors of the late Mr. Jaques, to offer for Sale by Auction at the Mart, Bartholomew Lane, near the Bank of England, on WEDNESDAY, October 25, at 12 o'clock, without the least reserve, the well-known collection of TULIPS, comprising all the leading varieties in cultivation, viz., Pandora, Salvator Rosa, Louis XVI., Thalia, Parmegiano, Democrat, Violet Alexander, Rose Lac, Camuse de Craix, Ponceau Brilliant, Arlette, Jeffrey's Elizabeth, Jenny Lind, Strong's King, Marcellus, Pompe Funèbre, Vivid, Duke of Sussex, &c.—May be viewed on the morning of Sale; Catalogues had at the Mart, of Dawe, Cottrell, and Benham, Seedsmen, Moorgate Street; White Swan, West Ham. Mr. Jaques, King Street, Cambridge Road; also of the Auctioneer, Shacklewell.

NURSERIES, COVENTRY.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. BROWN AND CLARKE will Sell by Auction, on TUESDAY, October 24, and following days, a Valuable NURSERY STOCK, the property of Mr. Ogden, who intends clearing a large portion of the Ground, consisting of about 200 fine specimens of Weeping Trees, large Common and Portugal Laurel, Laurustinus, Arbor vitæ, Box, Purple Beech Yew, Privet Phillyrea, Berberis, Cedars of Lebanon, &c. &c.; Rhododendron, Lilac, Guelder Rose, and other Flowering Shrubs and Trees. The Forest and Fruit Department consists of upwards of 4800 grafted English Elm, 1000 Oak, 220 Birch, 190 Beech, Ash, Chesnut, Poplar, &c.; Apple, Pear, and Cherry, in full and Dwarf Standards; a beautiful plant of Cycas Revoluta; about 100 very large Camellia, Scarlet Rhododendron, Azalea indica, Lilium lancifolium and other Greenhouse Plants, in pots. Sale to commence each day at 11 o'clock. A part of the Greenhouse Plants will be offered in the afternoon of each day's Sale.—Catalogues are now ready, and can be forwarded by Post to address.

ORCHIDS, STOVE, AND GREENHOUSE PLANTS.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 31st October, at 12 for 1 o'clock, a Collection of Orchids, including good Plants of Aerides roseum superbum, A. crispum, A. Odoratum purpureum, Vanda tricolor, Saccolabium retusium, S. Blumei major, Paphinia cristata, Trichopilia suavis, a new Cattleya, &c. Also a parcel from India, including many plants of Vanda Roxburghi; some imported plants from La Guayra, and 50 lots of Stove and Greenhouse Plants, many of which are fine specimens.—May be viewed on the morning of sale, and catalogues had.

RARE AND NEW PLANTS.

MR. J. STEVENS will include in the Sale at his Great Room, 38, King Street, Covent Garden, on TUESDAY, the 31st October, a consignment recently received from Mr. R. W. Plant, including six specimens of the very rare LODOICEA SECHELLAREM, or double Cocoa Nut of the Sechelles, in good condition; 6 specimens of the curious and remarkable plant STANGERIA PARADOXA; 7 specimens of a new species of Ansellia, and some other rare Orchids from the Zulu country, South Africa.—May be viewed on the morning of sale, and Catalogues had.

CAMELLIAS, RHODODENDRONS, AZALEAS, DEUTZIA GRACILIS.

A SECOND CONSIGNMENT FROM MR. J. BAUMAN, OF GHENT, FOR ABSOLUTE SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, 27th October, at 12 for 1 o'clock, 800 Camellias, of good sorts, with flower buds; 100 Yellow Rhododendrons; 100 Ghent Azaleas; 200 Deutzia gracilis; 3 Otaheite Oranges and other Orange Trees; and 1000 Gladioli.—May be viewed on the morning of sale, and catalogues had.

PUTNEY, SURREY.

TO COWKEEPERS AND OTHERS.

MESSRS. PROTHEROE & MORRIS will sell by Auction on the Premises, near the Fox and Hounds, and close to the Railway Station, Putney, on SATURDAY, October 28th, 1854, at 1 o'clock, about 4 acres Yellow Globe Mangold Wurzel, and 10 acres White Round Turnip; also half an acre Mitchell's Albert Rhubarb, the best in cultivation. May be viewed 1 week prior to the Sale. Catalogues may be had on the Premises; at the Fox and Hounds, of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BATTERSEA FIELDS.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by Mr. Fisher, to submit to an unreserved Sale by Auction, on the premises, Claremont Nursery, near the Duchess of York, Battersea Fields (in consequence of the ground being required for the Battersea New Park), the whole of the valuable STOCK of EVERGREENS, comprising very fine Arbor vitæ, Laurustinus, Hollies, Box, Aucubas, Euonymus, Common Laurels, Fine Yews, Rhododendrons, Lilacs, Roses, Daphnes, &c. Also a quantity of Fruit and Forest Trees, with a quantity of Box edging, &c. May be viewed one week prior to the Sale.—Catalogues may be had on the premises, 21, New Street, Battersea Fields; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BLACKHEATH.

TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, on the premises, Westpoint Nursery, Blackheath, on THURSDAY, October 26th, and following day, at 11 o'clock each day, without reserve (by order of Mr. Thompson), in consequence of the ground being taken for building purposes, the whole of the valuable Stock of Evergreens, fine Standard and Dwarf-trained Peaches, Nectarines, Apricots, Cherries, Standard Plums, Pears, Gooseberries, and Currants; about 2000 fine Standard and Dwarf Roses, a quantity of Box Edging, Clematis, Jasmine, &c.; also 200 fine Double Camellias, specimen Azalea indica, Epacris, Acacias, Aphelexis, Ericas, Eutaxia Corræa, &c.; with two capital Iron Rollers, and sundry effects.—May be viewed one week prior to the Sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET GARDENERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the administrators of the late Mr. Joseph Fairbairn to sell by Auction, on the premises, The Retreat, Larkhall Lane, Clapham, on MONDAY, October 23d, and following days, at 11 o'clock each day, the whole of the valuable stock of FRUIT TREES, consisting of Standard, Dwarf, Trained and Untrained Peach, Nectarine, Apricot, Apple, Pear, Plum, Cherry, Gooseberries, and Currants, &c.; also Ornamental Trees, Evergreens and Deciduous shrubs, &c.—May be viewed one week prior to the Sale. Catalogues to be had (6*d.* each, returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

STOKE NEWINGTON.

TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS beg to announce that they have received instructions from the Administrators of the late Mr. W. Watts, of Stoke Newington, to Sell by Auction, without reserve, on the premises, on MONDAY, October 30, and three following days at 11 o'clock each day, the whole of the valuable Nursery Stock, consisting of an immense quantity of American Plants, Ornamental and Fruit Trees, Evergreens, and Deciduous Shrubs, comprising 85,000 Rhododendrons, 5000 Ghent Azaleas, 2000 Limes, 1200 Thorns, 1000 Poplars, Planes, Elms, Laburnums, Chesnuts, &c., Standard and Dwarf Trained Peach, Nectarine, Apricot, Apple, Pear, Plum, Cherry, Gooseberries, and Currants; Standard Damsons; 1200 fine Mulberries, &c.; 5000 Arbor-vitæ, 6000 Hollies, 3 feet; 4000 Box, 7000 Aucubas, 3000 Euonymus, Perpetual and Common Laurels, Lilacs, Roses, Daphnes, Yucca Filamentosa, &c.; also Greenhouse Plants, including 200 fine Double Camellias, 50 very fine specimen Indian Azaleas, Heaths, Epacris, &c.; together with Greenhouses, 2 and 3-light Boxes, Gold and Silver Fish in Ponds, an excellent Horse, two capital Carts, Wheelbarrows, Garden Tools, a quantity of Box-edging, and sundry effects.—May be viewed one week prior to the Sale. Catalogues may be obtained (6*d.* each, returnable to purchasers) on the premises of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT & EXTENSIVE SALE OF NURSERY STOCK.

BROMLEY HILL NURSERY, KENT.

MR. T. BAXTER is directed to Sell by Auction on WEDNESDAY, October 25, and following days, on the premises, comprising several thousands of Laurels, Laurustinuses, common and variegated Hollies and Box, Larches and Firs of sorts, Oaks, Elms, Beech, Spanish and Horse Chesnuts, fine Cedars and Yews, Poplars, Weymouth Pines and Evergreens, and Shrubs of the various sorts. 6000 transplanted quick Fruit Trees of the best sorts, and fine Mulberries, &c. A splendid large, and very fine-grown Purple Beech, and less ditto; well-rooted, young and thriving plants. May be viewed 10 days prior to the Sale, and Catalogues had of Messrs. BECK and ALLEN, Seedsmen, Strand, London; Dover Castle, Deptford; and of the Auctioneer, Bromley, Kent.

BRITISH POMOLOGICAL SOCIETY. — The FIRST EXTRAORDINARY MEETING of the BRITISH POMOLOGICAL SOCIETY will be held on MONDAY, 6th November next, at the Rooms, 20, Bedford Street, Covent Garden, London. The objects of this Meeting are to receive and exhibit Collections of Fruits from different parts of the country, and to ascertain their adaptability to the various soils and climates of Great Britain; to report upon the merits of new varieties; and to furnish the correct names of any varieties which may be submitted for that purpose.

All who are concerned in the cultivation of Fruits are invited to send collections of as many varieties as can be obtained; and to accompany them with a statement as to the soil, exposure, and latitude in which they were grown. All Collections should be forwarded before the 4th of November, addressed to the SECRETARY, 20, Bedford Street, Covent Garden, London.

SCOTTISH GARDENERS' AND LAND-STEWARDS' ASSOCIATION.

ELECTION OF PENSIONERS.— The Annual General Meeting for the Election of Pensioners, and on other business, will be held here on WEDNESDAY, Nov, 8, at Seven o'clock in the evening. By order of the Board, J. H. BALFOUR, Chairman.

Chambers, 6, York Place, Edinburgh.

TO NURSERYMEN, MARKET GARDENERS, & OTHERS.

TO BE SOLD, at very reduced prices, 10,000 very strong 2, 3, and 4-year old GOOSEBERRIES and CURRANTS, of the best sorts.—For further particulars, apply to LAKE & DYER, Nurserymen, Bridgewater.

LARGE CAMELLIAS, AZALEAS, ETC.

TO BE SOLD, Twenty CAMELLIAS, from 3 to 6 feet in height; several AZALEAS, and other GREENHOUSE PLANTS.—For particulars, apply by letter to C. W. M., Post Office, Bushy Heath, Herts.

FINE SPECIMEN PLANTS.

J. AND J. FRASER beg to invite attention to their magnificent Collection of large AZALEAS, HEATHS, and other Plants, which were never in such good condition as at the present time. This is an excellent opportunity for buyers as (on account of not having sufficient room) the plants will be offered at very low prices.

The Nursery, Lea Bridge Road, Essex.—Oct. 28.

VARIEGATED HOLLIES.

THE SUBSCRIBERS having a large stock of Striped and other Worked HOLLIES, recommend this as a favourable time for removal; in considerable quantities they are sold cheap.—WM. URQUHART & SONS, Dundee.

J. SMITH AND SONS, Tansley, near Matlock, begs to offer cheap, an over-stock of one or two years' Seeding OAK, one year's BEECH, and one year's SYCAMORE; also Transplanted Beech, in sizes from 1½ to 5 feet. Price, according to quantity required, on application.

CHARLES DALY AND SON beg to offer the following:—One year Seedling Thorns, at 1*s.* 6*d.* per 1000; Two years Transplanted, 6*s.* do. Laurel, 10*s.* per 1000; Portugal do, 4*s.* per 100, good plants. Irish and Spread Yews. Bushes for hedges, Forest Trees, Seedlings do, and Grass Seeds cheap.

Prices sent free by Post.—Coleraine, Oct. 28.

LARGE EVERGREENS, ETC.

JOHN ADAMS, NURSERYMAN, Park Lane, Brompton, near the "Hoop and Toy," calls the attention of gentlemen and the trade engaged in autumn planting to his extensive stock of LARGE EVERGREENS, comprising Hollies, Yews, Red Cedars, Siberian, China, and American Arbor vitæ, Tree Box, Edging Box, Laurels, Bays, Cedrus deodara, Pinus excelsa, &c., &c., all of which are in a fine condition for moving.

A fine stock of large Fruit Trees for immediate bearing.

FOREST TREES, ETC.

PETER LAWSON & SON, Edinburgh, the QUEEN'S SEEDSMEN, &c., respectfully acquaint their patrons in England and the public, that their PRICED LIST of PLANTS for the season is now ready, and may be had on application, at their Branch Establishment in London.

All orders sent to the London Branch will be immediately executed, and delivered in London free of expense.

27, Great George Street, Westminster, October 28.

TO GENTLEMEN ENGAGED IN PLANTING.

JAMES GRAHAM, Successor to Messrs. Silverlock & Son, respectfully invites attention to his Stock of Hardy Ornamental Trees and Shrubs, fine large Transplanted Forest Trees, Trained Peaches and Nectarines on walls, Apricots, Plums, Apples, Pears, Cherries, &c.; Figs, Gooseberries, Currants, Strawberries, &c.; Grape Vines from Eyes, Archangel Mats, Mushroom Spawn, Dutch Bulbs, &c. SEEDS.—Improved Sion House Cucumber Seed, 2*s.* per packet.

N.B. Gardens and Pleasure Grounds laid out and planted.

North Gate Nursery, Chichester.

TO PLANTERS OF ORNAMENTAL & HARDY CONIFERS & SHRUBS.

YOUELL AND CO. beg respectfully to invite the attention of those Gentlemen who may be engaged in planting the above, to their Advertisement which appeared in the *Gardeners' Chronicle* of October 14.—Royal Nursery, Great Yarmouth.

SECOND IMPORTATION.

FRESH IMPORTED BULBS *bloom much finer than those which have been long exposed to the air before planting.*

JOHN SUTTON AND SONS, Reading, Berks, can supply FINE BULBS, just imported, at low prices; see their Catalogue, which may be had, post free, in return for one penny stamp.

Woking Nursery, 1½ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—Oct. 28.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Pine-apple Place, Edgeware Road, London.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Baghshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

THE PERPETUAL TREE VIOLET, or DOUBLE VIOLA ARBOREA.—The original grower of this, the true variety of the above beautiful Violet, now offers it to the public; it has surpassed all others, and now stands without an equal for its size of flowers, fragrance, and perpetual blooming; and as a plant for the Conservatory or Greenhouse, nothing can equal it. Large plants, 6s. per dozen; smaller ditto, 3s.

DOUBLE WHITE TREE VIOLET.—This is also a fine variety, and resembles the other in many respects, with the exception of its colour. The stock of this is small, in consequence of the great demand for it last season; parties requiring plants should not delay their orders. 6s. per dozen.

THE RUSSIAN SUPERB VIOLET.—One of the finest of single Violets, large blooms, with long stems, and most delightful fragrance; will bloom well through the season if sheltered from the heavy rains and severe frosts during the dead of winter. Plants 3s. per dozen.

A TREATISE on the best and most effectual mode of cultivating the VIOLET, post free for 12 stamps, or sent gratis with all orders above 5s.

GIANT SCARLET BROMPTON STOCK plants are now ready for planting out: the spikes of flower are very large, (measuring from 18 to 24 inches in length, and so fragrant that they are admired by all who have seen them. Fine strong plants, 6d. per dozen, or 4s. per 100.

STRAWBERRY PLANTS.—Good strong plants of the following superb varieties can be supplied:—Nimrod, 10s. per 100; Prince of Wales, 10s. do.; Ajax, 5s. do.; Ruby, 5s.; Myatt's Eleanor, 3s. do.; British Queen (true), 3s. do.; Black Prince, 3s. do.; Cremont's Perpetual, 3s. do.; Victoria, 5s. do.; Surprize, 3s. do.; and a great number of other good old varieties, at 3s. per 100.

POLYANTHUS SEED, saved from the best laced varieties, 1s. per packet.

ANTIRRHINUM SEED, all saved from the best named varieties, 1s. per packet.

EXTRA FINE SWEET WILLIAM SEED, saved from all the best and most beautiful varieties, 1s. per packet.

VERY SUPERIOR WELL RIPENED HOLLYHOCK SEED, 1s. per packet.

LORD KEYNON'S FAVOURITE CUCUMBER is the best and most productive for winter cultivation ever grown, requiring less heat than any other of the kind. It is a very handsome fruit and free setter. Good old seed of the above true variety may be had, price 2s. 6d. per packet.

The Violets and Seeds will be sent postage free, but the Strawberry Plants and Stocks will be sent by hamper, package free.

Any of the above will be forwarded on receipt of Post Office Order, or Penny Postage Stamps, for the amount by

EDWARD TILEY, Nurseryman, Seedsman, & Florist,
14, Abbey Churchyard, Bath, Somersetshire.

BASS AND BROWN *beg to offer the following from their New* CATALOGUE, *just published, which may be had on application for three postage stamps. They have this season a very fine and vigorous stock of Roses, which are offered at very reduced prices.*

Post Office orders payable to BASS & BROWN, *or to* STEPHEN BROWN, *Seed and Horticultural Establishment, Sudbury, Suffolk.*

RARE CONIFERÆ.

ALEX. PONTEY, NURSERYMAN, Plymouth Nursery, Plymouth, begs to inform Gentlemen wishing to add to their Arboretums, that he can supply the following. Most of the kinds are planted in his Arboretum. He can warrant them hardy.

ALEX. PONTEY particularly calls attention to the THUJIOPSIS BOREALIS, which has proved quite hardy, and one of the grandest Coniferæ in cultivation. My specimen plants are now 3 feet high, and show their true character. Lists and prices will be forwarded on application.

N.B. A. P. can offer an extra-sized Libocedrus Chilensis about 6 feet high—splendid specimen.

Plymouth Nursery, October 28.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to recommend to the attention of Gentlemen and others engaged in Planting, the following plants from his general Stock, they are in fine healthy condition. The American Plants annually exhibited at the Royal Botanic Gardens, Regent's Park, are supplied from this establishment.

RHODODENDRONS.—The following is a selection of the most admired scarlet, rose, and high-coloured varieties in cultivation; are perfectly hardy, and bloom for the most part during the month of June.

Blandyanum, fine rosy crimson	5s. to 7s. 6d. each.
Lady Eleanor Cathcart, vermilion rose and dark crimson spots	21s. 0d. "
Lady Wenlock, bright crimson	21s. 0d. "
Atrosanguineum, dark scarlet	10s. 6d. "
Alaric, dark purplish crimson	7s. 6d. "
Omer Pasha, dark crimson, new	10s. 6d. "
Juba, crimson, intensely marked	10s. 6d. "
Lefevreanum, crimson, tinged with purple	10s. 6d. "
Attila, dark crimson	7s. 6d. "
The Grand Arab, fine glowing crimson	7s. 6d. "
Brayanum, crimson	10s. 6d. "
Nobleanum bicolor, crimson, white eye	7s. 6d. "
Vandyke, light crimson	10s. 6d. "
Blatteum, dark purplish red	7s. 6d. "
Rubens, light rose	10s. 6d. "
The Duke of Norfolk, clear rose, fine	10s. 6d. "
Celebrandum, dark crimson purple	10s. 6d. "
Rembrandt, fine crimson	10s. 6d. "
Congestum roseum, fine rose, well marked	21s. 0d. "
Roseum novum, clear rose	10s. 6d. "
Leopardi, rosy purple, and very much marked	5s. 0d. "
Floribundum coccineum, fine	10s. 6d. "
Erectum, good crimson	7s. 6d. "
Towardianum, large rose, fine	10s. 6d. "

For planting extensively, no kinds of Rhododendrons are better calculated for a display than the varieties of the noble Catawbiense; they are all perfectly hardy, producing fine trusses of blooms of various hues—scarlet, rose, purple, white, and spotted white. The list below contains the leading kinds:—

Catawbiense, good bushy plants, 50s. to 63s. per 100.
" larger, 1½ to 2 feet, 12s. to 18s. per doz.
" seedlings, fine bushy plants, 12s., 18s. to 24s. per doz.

Catawbiense bicolor	Gloriosum
" splendens	Sherwoodianum
Album elegans	Bouquet de Flore
" grandiflorum	Melanthauma
Cæleste	Pictum
Cyaneum	Roseum elegans
Candidum	Victoria
Delicatissimum	Maculatum nigrum
Egregium	" purpureum
Everestianum	Macranthum
Fimbriatum	Nivaticum
Mirandum	Perspicuum
Lindsayanum	

Good strong well established bushy plants, 30s. to 42s. per doz. Larger plants can be supplied at a corresponding advance of price.

STANDARD RHODODENDRONS.—Of these, without doubt, we possess the largest stock of really good kinds. Nothing can be more imposing when in bloom than a handsome standard. We have them 3 feet to 5 feet stems, and handsome symmetrical heads. The price of such would range from 42s. to 105s. each.

Rhododendron ponticum, good plants, 10s. 6d. per 100; larger, 1 to 1½ to 2 feet, 12s. 6d., 15s. to 25s. per 100. This is especially worthy the attention of planters; it will thrive in any soil, and in the most severe weather; is never injured by hares or rabbits. Unquestionably it is by far the best shrub for under cover.

KALMIA LATIFOLIA, good bushy plants, 60s. per 100; larger, 12s., 18s. to 24s. per dozen.

HARDY HEATHS, in 20 fine, named, varieties, many of them well suited to form edgings for larger clumps, 35s. to 42s. per 100.

HARDY AZALEAS.—A good assortment, if left to our selection, suitable for extensive planting, 1 to 1½ and 2 feet, 31. 3s. per 100. The very best selected plant and other varieties, 18s. to 30s. per dozen. These produce flowers of all colours—scarlet, rich orange yellow, rose, and white.

STANDARD ROSES, of the most approved Perpetual and Bourbon varieties, 3 to 4½ feet stems, 18s. per dozen.

PINUS Douglasi, handsome seedling plants, 3 to 4 and 6 feet.
" insignis; we strongly recommend our stock of this justly admired Fir, all of which are from seed, 2 to 3, 4, & 5 ft.
" cembra, 3 to 4 and 5 feet.—Pinus excelsa, 3 to 6 feet.
" macrocarpa, 2 to 3 feet.
" Lambertiana, very handsome, 3 to 4 feet.
Araucaria imbricata, splendid formed specimens, 2 to 4 feet.
Cedrus deodara, of all heights, from 1 to 8 feet. We have a large quantity about 4 to 6 feet.
" Africana, 3 to 4 feet.
" Lebanon, handsome grown specimens, 3 to 6 feet.
Cryptomeria japonica, 3 to 12 ft.—Libocedrus chiliensis, 2 to 3 ft.
Fitzroya Patagonica, 2 feet.
Cupressus Goveniana, 3 to 4 feet.
" Lambertiana, 3 to 4 and 5 to 6 feet.
Irish Junipers, 4 to 5 feet.—Irish Yews, 4 to 8 feet.

The above-named Coniferous Plants have been frequently transplanted, are perfect specimens, and have never been grown in pots. Prices will be forwarded on application.

J. W. begs respectfully to solicit an inspection of his stock, from those who are engaged in planting. A Catalogue, containing full descriptions of his celebrated Collection of Rhododendrons, as exhibited by him at the Royal Botanic Gardens, Regents Park, can be obtained by inclosing two Postage Stamps.

WILLIAMS' EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON have been appointed Agents by Mr. Davis, of Malvern, for the sale of the above-named magnificent CLIMBING ROSE. Good established plants, 3s. 6d. each. Usual discount to the trade. For particulars purchasers are referred to their own and Mr. Davis' advertisements in *Gardeners' Chronicle* of October 7, page 643.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

NEW VARIEGATED GERANIUMS.

JOHN AND CHARLES LEE beg to inform the admirers of Variegated GERANIUMS that they have purchased the Stock of two very promising Seedlings, which are decided improvements on those already introduced by them. The first they have named

MRS. LENNOX,

in compliment to the lady of the raiser, Thomas Lennox, Esq., of Stamford Brook Lodge, Hammersmith. The whole aspect of this plant is very striking, the habit being extremely vigorous, with leaves measuring from 4 inches to 6 inches across, and having a broad margin as white as the driven snow. The trusses are very large, of the most intense scarlet, and stand well above the foliage. The other they have named the

SCARLET FLOWER OF THE DAY,

giving an accurate idea of its character and properties. The foliage and habit are precisely the same as in "The Flower of the Day." The truss is larger and bolder, and the pips are well shaped and of great substance. The colour is all that can be wished for, being a fine scarlet, vieing with even the most favourite green-leaf varieties, and is not subject to burn under the hottest sun, either under glass or out of doors. Notice will be given next season, when they are ready to be sent out. This is inserted to prevent other parties from adopting the same names.

Nursery, Hammersmith.

BARCHARD'S SEEDLING APPLE.—This beautiful Apple was raised from seed by Mr. Higgs, upwards of 20 years gardener to Mrs. Barchard, by whose kind permission he now begs to offer it to the Nobility and Gentry. It has been twice shown to Mr. Thompson, and also cut up at the Horticultural Society's Rooms, Regent Street, where it was highly approved of, and considered to be of first-rate quality; in proof of which Mr. Thompson's opinion of it is given:—

"BARCHARD'S SEEDLING.—Fruit received from Joseph Barchard, Esq., in whose garden it was raised, and fruited for the first time in the present season. Fruit middle size, roundish oblong, obtusely angular; eye rather deeply sunken, surrounded with projecting folds; stalk short, not deeply inserted; skin dark shining red next the sun, streaked towards the shaded side, which is of a pale orange tinge; flesh yellowish white, tender, with a rich brisk sugary flavour. This sort is worthy of cultivation.—ROBERT THOMPSON, Sept. 22, 1852."

It is also described as first-rate quality in the Catalogue of New Fruit in the Horticultural Journal of October 1, 1853, vol. viii., where a full description of it is given. The whole of the stock is in the hands of Mr. Dancer, of the Fulham Nursery. Strong one-year old plants, 5s. each; extra strong plants, two years old, 7s. 6d. each.

All Post Office Orders directed to Mr. MATHEW HIGGS, Putney Heath, payable on the Putney Post Office, will be promptly attended to, and good strong plants immediately forwarded.

CHOICE NEW GERANIUMS, &c., AT REDUCED PRICES.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, having a large stock of the following NEW GERANIUMS in 4-inch pots, good, strong, healthy, well-established plants, begs to offer them, at purchaser's selection, 36s. per dozen, viz.—Empress, Leah, Neatness, Picta, Rebecca, Marginata, Eliza, Helen, Glow-worm, Virginia (Hoyles), Attraction, Purple Perfection, Indian Chief, Majestic, Regalia, Governor-General, Carlos, Zeno, Tamberlik, Rosa, Lucy, Duchess of Wellington, and Rhoda. Choice varieties of 1853, strong plants, 15s. per dozen. Fine old show varieties, 6s., 9s., and 12s. per dozen. Fine spotted French varieties, which are very showy and attractive, 2s. 6d. each. Choice fancy varieties, 9s., 12s., and 18s. per dozen.

CINERARIAS, from a collection of more than 100 of the best varieties, new of last season, 18s. per dozen; choice older varieties, 6s., 9s., to 12s. per dozen.

PANSIES, of which H. W. has several thousands of plants of the best in cultivation, 4s. 6d., 6s., 9s., 12s., and 18s. per dozen.

CARNATIONS AND PICOTEES, fine show varieties, 9s., 12s., to 30s. per dozen pairs, or 25 pairs for 21s.

HOLLYHOCKS, including the best varieties cut, 6s., 9s., 12s., to 30s. per dozen.

All the newest and best FUCHSIAS of this season, 1s. 6d. and 2s. each, or 18s. per dozen.

VERBENAS: new varieties of this season, 1s. each, or 9s. per dozen.

PETUNIAS: new varieties of this season, 1s. 6d. each, or 15s. per dozen.

Also a large collection of FERNS AND LYCOPODS at very low prices. Parties intending to make a select collection would do well to inspect H. W.'s catalogue.

Collections of STOVE AND GREENHOUSE PLANTS at reduced prices.

CINERARIA SEED from the best varieties, 1s. 6d., 2s., and 2s. 6d. per packet, post free.

Descriptive Lists of the above now ready, and may be had for one postage stamp. A remittance is respectfully requested from unknown correspondents, made payable at Marsden, Lancashire.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for GERANIUMS (show and fancy), FRENCH GERANIUMS, FUCHSIAS, VERBENAS, FAIRY ROSES, CHRYSANTHEMUMS, HELIOTROPES, CINERARIAS, CALCEOLARIAS, PRIMULAS, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

The stock of show Geraniums exceeds 50,000, and comprises upwards of 750 varieties, amongst which almost every known kind will be found. The newest sorts, such as Carlos, Virginia, Rosa (Foster's), Leah, Picta, Marginata, Empress, Neatness, &c., can be had at 3s. 6d. each, or 40s. per dozen. The older varieties from 9s. to 25s. per dozen.

The selection of FRENCH GERANIUMS consists of 40 distinct sorts (exclusive of those English Geraniums which some class with them), at 2s. 6d. each, or 25s. per dozen.

SEEDLING CINERARIAS (10,000), from seed of first-rate flowers, at 4s. per dozen, in 60-sized pots.

20,000 SEEDLING HERBACEOUS CALCEOLARIAS now on hand at 4s. per dozen in 60-sized pots. These flowers have been raised from the seed of the best of last year's stock, which received general praise.

An immense quantity of good fimbriated PRIMULAS at 4s. per dozen in 60-sized pots, and 6s. per dozen in 48's.

CHRYSANTHEMUMS (Lilliputian and large flowering) at 6s. and 9s. per dozen for plants which will flower this season. Large magnificent plants at 18s. and 15s. per dozen—all the best sorts.

The foregoing have been selected as examples only, it being impossible within the limits of an advertisement to afford particulars of a stock so extensive; Catalogues will, however, be forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, PROPRIETOR.

CHRYSANTHEMUMS.

R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's selection at 9s. per dozen.

CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4s. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9s. per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12s. per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

SUPERB DOUBLE HOLLYHOCKS.

JOSEPH BAXTER, Gardener to R. Hills, Esq., Colne Park, near Halstead, Essex, begs to announce that he has now ready for sending out a large stock of extra strong plants of nearly all the varieties yet sent out; also some superb new varieties of J. B.'s own raising.—Descriptive Catalogues will be sent post free on the receipt of a postage stamp; also Seed saved from J. B.'s superb collection; 150 Seeds mixed for 12 postage stamps. Collections, consisting of well contrasting colours, at 6s., 10s., 15s., and 25s. per dozen; if good double contrasting colours for Borders, not named, 4s. per dozen, left to J. B.'s own selection. A remittance is solicited from unknown correspondents. Post Office orders, payable at Halstead, Essex.

NEW CLIMBING HYBRID PERPETUAL ROSE, THE "DUCHESS OF NORFOLK."—Colour, Vivid Crimson. To be sent out for the first time about the end of October.

WILLIAM WOOD AND SON beg to refer to their advertisement in the *Gardeners' Chronicle* of September 30, page 627. Standards, half-standards, or dwarfs, will be supplied at 10s. 6d. each, with the usual allowance to the trade.

N.B. When six plants or more are ordered by the trade, a very considerable reduction will be made beyond the usual discount, particulars of which may be had on application.

A Drawing of the above may be had for 6 Postage Stamps.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

CHATERS' SEEDLING PANSY, PICOTEE.

J. CHATER AND SON beg to announce that they intend sending out after the 20th October, their SEEDLING PANSY named PICOTEE, in strong plants, 5s. each. Pure white ground, beautifully edged with azure blue; eye large, fine form and substance. The margin of this flower resembles a fine Picotee.

Also Hollyhock Seed, from the best sorts, in packets containing 200 Seeds, 1s. 6d.; 400 Seeds, 2s. 6d.

Fine Plants of splendid Sweetwilliam, 1s. 6d. per dozen; 10s. per 100.

Choice Pansy Seed, 1s. to 2s. 6d. per packet.

A catalogue of the best Hollyhocks, Pansies, Roses, and Pinks, can be had on application to J. CHATER & SON, Nurseries, Haverhill, Suffolk.

CRIMSON PERFECTION RHUBARB.

ROBERT SALT, of Longton, Staffordshire, begs to inform the Gentry and Nurserymen that this splendid variety of Rhubarb is now ready for distribution, and shall feel happy to serve parties who may favour him with their orders.

R. S. begs to state that it is the most splendid, early, and prolific variety ever offered to the public. Orders addressed to ROBERT SALT, Longton; Messrs. Hurst and M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess and Kent, Penkhull; Messrs. Francis and Arthur Dickson, Eastgate Street, Chester; Mr. Wood, Nurseryman, Nottingham, will have immediate attention. Price 7s. 6d. per root, three for one guinea, and six for 2l. A liberal discount allowed to the Trade. A Post-office Order from unknown correspondents.

OMER PACHA STRAWBERRY.

WILLIAM JAMES WARD has still to spare a few more well-rooted plants of the above excellent Strawberry. Testimonials of the highest order. See advertisement in the *Gardeners' Chronicle*, August 26; also in the Descriptive List of New Fruits in the "Florist and Fruitist," Sept. Number, accompanied with a woodcut.

100 Plants ...	... £3 0 0	25 Plants ...	... £1 0 0
50 " ...	... 1 15 0	12 " ...	... 0 12 0

Prospect Hill, Reading, Oct. 28, 1854.

NICHOLSON STRAWBERRIES REDUCED IN PRICE.

WILLIAM NICHOLSON is now sending out strong well-rooted Plants of his four new and distinct Strawberries, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy; RUBY, ditto, a great bearer, and forces well; CAPTAIN COOK, market fruit, large, and a great bearer; FILLBASKET, ditto, 6s. per 100, box included. Most of the old and new sorts can be supplied.

*** See Mr. J. W. KINMONT'S remarks on the above Strawberries, printed in No. 31, 1854, page 501, of this Paper.

Post-office Orders, payable at Yarm, Yorkshire, or a cash remittance required with the order.

Egglescliffe, near Yarm, Oct. 28, 1854.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50s.; 50, 30s.; and 25, 16s. Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5s. per 100.

Manor Farm, Deptford, October 28.

CHARLES TURNER has much pleasure in introducing the NEW RHUBARB—"SCARLET NONPAREIL." This very superior variety was raised by J. Riley, Esq., of Birkbey, near Huddersfield, who has placed the stock in CHARLES TURNER'S hands for sale. It is unquestionably the best and most distinct variety yet introduced, being of a deep rich colour; when cooked, tender, juicy, and remarkably free from acidity. This variety is very strongly recommended by several eminent judges.

Samples have been forwarded to the Editors of the various publications, who have most warmly recommended it above all the existing varieties.

In the May (1854) No. of the "Florist," the Editors remark:—

"RHUBARB.—Mr. Riley, Your 'Scarlet Nonpareil' is in every respect a very desirable variety—tender, juicy, high coloured, and remarkably free from acidity. In tarts it has more the flavour of Apricots than Rhubarb."

In the "Gardeners' Record" of May, 1854, Mr. Neville remarks:—

"J. Riley.—SEEDLING RHUBARB 'SCARLET NONPAREIL.'—This is a superior variety, deep crimson; the juice, when cooked, approaches that of Damsons in colour, and is of a rich and delicious flavour. The stem should not be pared, as is usual with most kinds, as it needs only wiping clean. It is an early variety, and will prove an invaluable acquisition."

Plants now e y t 5s. each.—Royal Nursery, Slough.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.

Seed Establishment, 181, High Holborn, London.

VINES IN POTS,

GROWN UNDER GLASS FROM SINGLE EYES, 4 to 6 feet high.

ALEXANDER PONTEY, NURSERYMAN, Plymouth, begs to offer the following sorts of VINES, warranted true to name. If 12 or more are ordered, they will be delivered free in Bristol or London; price 2s. 6d. to 3s. 6d. each.

VINES.—Alicant, or Black Spanish; Barbarossa; Black Hamburgh; do. Hampton Court; do. Warners; Constantia, black; Eschalota superba; Frontignac, White; do. Grizzly; do. Red; Gromier de Cantab; Joslyn St. Aubyns; Muscat of Alexandria; do. Tottenham Court; do. Lunel; Lees (early); do. Canon Hall; St. Peter's (Oldacres), black; Wilmot's Royal Victoria; Tripoli (Wellbeck's); Sweet Water (White Dutch); do. Grove's End.

Plymouth Nursery.—Oct. 28, 1854.

HOLLYHOCK SEED.

WILLIAM CHATER begs to offer packets of the above Seed, containing twenty sorts, selected from his best show varieties, at 5s.; 12 varieties, do., 2s. 6d.; and from good double border sorts, at 1s.—Also Pansy Seed, from the best flowers, 2s. 6d. per packet.—Strong Plants of the new Double Crimson Rocket, excellent bedding plants for spring flowering, 6s. per dozen, or 2l. per 100; Double French White, 4s. per doz., or 30s. per 100.—Saffron Walden, October 28.

CARNATIONS, PICOTEES, PANSIES, ETC.

JOHN SCHOFIELD AND SON have now ready strong plants of all the approved CARNATIONS, PICOTEES, PINKS, and PANSIES, as follows:—25 pair of Carnations and Picotees, 1l. 1s.; 25 pair of Pinks, 15s.; 25 Pansies, 1l. 1s. A Descriptive Catalogue of the above, &c., is ready; also a few packets of Pansy and Hollyhock Seed carefully selected from the finest sorts, 2s. 6d. per packet.—Knowsthorpe, near Leeds, Yorkshire.

SUPERB SHOW CARNATIONS, PICOTEES, PINKS, PANSIES; &c. &c. &c.

	£	s.	d.
25 pairs Show Carnations (named)	1	0	0

Auriculas, Alpines, Polyanthuses, Primroses, Belgian Daisies, &c. &c.—Priced and descriptive Catalogues now ready for one stamp. Post Office orders payable at Middleton, Lancashire.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

TO SEEDSMEN AND POTATO GROWERS.

JOSEPH WILSON, Seedsman, Ipswich, begs most respectfully to inform the trade and others, that their orders to any extent can be executed for the following early varieties of Seed Potatoes, they are all well known, and require but little to be said in their favour by way of recommendation; but it may be necessary to say, that they are quite free from disease, and that each variety will be guaranteed a "true stock," viz.:—

Jackson's Improved Early Ashleaf, per bushel ...	9s.	0d.
The Short Top ditto	7	6
" Moss Kidney	7	0
" Cambridge	7	0
" Prolific	7	0
" Fisherene	7	0
" British Queen's	7	6

No charge for sacks, and free to London—trade price on application.

JOHN CATTELL, Westerham, Kent, begs to inform the public that his Descriptive Priced CATALOGUES of his extensive collection of NURSERY STOCK for the current season, are now ready, and may be had on application, enclosing a penny stamp for each, excepting Catalogue No. 10, which will require two penny stamps.

CATALOGUE No. 6.—GRAPE VINES, STRAWBERRIES, RASPBERRIES, &c.
" No. 8.—ROSES.
" No. 9.—FRUIT TREES.
" No. 10.—HARDY ORNAMENTAL TREES AND SHRUBS, CONIFERÆ, AMERICAN PLANTS, CLIMBERS, &c.
" No. 11.—FOREST TREES, &c.

BASS AND BROWN'S NEW AUTUMN CATALOGUE, containing the following, is now complete, and supplied free by post for three Penny Stamps.

Dutch and Cape Roots.	Hardy Herbaceous Plants.
Geraniums.	Potentillas.
Cinerarias.	Hollyhocks.
Azalea indica.	Antirrhinums.
Fuchsias, Verbenas, Petunias (best new of 1854.)	Conifers, and other Select Trees and Shrubs.
Stove and Greenhouse Plants.	Hardy Climbers. Roses, Fruits, &c. &c.

Seed and Horticultural Establishment, Sudbury, Suffolk.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 28, 1854.

WE continue to receive valuable information respecting the effects of last winter from various kind correspondents; with all which we shall endeavour to deal as soon as the examination of the Horticultural Society's report shall have been disposed of.

It is not a little remarkable that GARRYA *elliptica*, an Oregon plant, naturally associated with *Berberis Aquifolium*, *Ribes sanguineum*, *Spiræa ariæfolia*, and similar hardy plants should have suffered so generally; for although not killed altogether in any place from which reports were received, yet we know that it scarcely escaped with life in the immediate vicinity of London. Chiswick, Ware, Bromley, Shiffnal, Rolleston, and Nottingham, all speak of the injury it sustained; and it is only from Windermere, Bicton, and Southampton, that reports are uniformly favourable. This circumstance is the more remarkable seeing that *Garrya macrophylla*, a much more southern plant, can scarcely be said to have suffered more. To us the facts connected with *Garrya elliptica* are inexplicable; they, however, serve to swell the evidence that the hardiness of a plant is not to be judged of accurately by considerations derived merely from latitude and elevation above the sea; but that innate constitution must also be inquired into. They also suggest that a northern species of a southern genus is not to be relied upon; although the climate from which it comes would seem to justify the anticipation of its proving hardy.

The New Holland GREVILLEAS, *rosmarinifolia* and *sulphurea*, well as these pretty shrubs suit the south of England, are unmistakeably tender to the north, and away from the sea.

Seeing how much the common HOLLY suffered in many places, it is not a little interesting to observe that other species, natives of better climates than our own, were hardly more affected by the frost. Ilex *perado*, *latifolia*, *dipyrena*, and *opaca*, seem scarcely inferior in hardiness to the common Holly, which is itself a greenhouse plant in central Germany. As for the new Chinese species *furcata*, *cornuta*, and *microcarpa*, the accounts are conflicting, but rather favourable than otherwise.

The Chinese and Indian INDIGOFERAS, very pretty flowering shrubs, will hereafter rank in hardiness with the Fuchsia.

Of the newer JASMINES, *J. nudiflorum* has vindicated its claim to perfect hardiness, as has also FORSYTHIA viridissima, from the same country; they thus form the two brightest gems of our winter; even *J. revolutum*, *affine*, and *Wallichianum*, although killed to the ground, have perfectly recovered.

The Californian SWEET BAY, *Laurus regalis*, seems as hardy as the common species, if not more so. But it is as yet too rare to enable us to form a fixed opinion. The Californian GALE, *Myrica californica*, is, we hope, perfectly robust, and thus makes a really good addition to evergreen shrubs; a death is reported from Alton, but it may have been accidental. None of the Asiatic *Ligustrums* seem fit for the open ground north of London, unless it be *L. ovalifolium*.

The OLIVE TREE of Nikita, in the Crimea, a variety more hardy than the common kind, lost its young branches, but recovered. This gives us a measure of the hardiness of the Crimean shrubs from the warm sheltered nooks in the south of the peninsula. Nikita, the station of the rich Russian Botanic Garden, is near Yalta, and in the same latitude as Sebastopol. Its climate must be much finer than that of the high land at its back.

The Californian Horse Chesnut, *Pavia californica*, seems to be hardy; and even that from Nepal, *Pavia indica*, promises well. No doubt both will bear our cold whenever they can ripen their wood. PHOTINIAS must now be placed permanently among evergreens unsuitable for a vigorous climate, for even *P. arbutifolia*, once thought the hardiest of all, perished at Chiswick; there, however, *P. glabra*, a fine standard, sheltered by a wall, went through the winter pretty well. London seems to be the northern limit of this genus. PISTACIAS are spoken ill of, even at Bicton; yet we have this morning seen a good bush of *P. mutica*, the Crimean species, which has lived unsheltered for these 10 years past in a very cold garden, among rockwork, facing the south, and it has never suffered in the smallest degree. Certainly it is the hardiest of its race.

As to OAKS, there seems no hope of cultivating the Mexican species in the open ground. Some Himalayan kinds, such as Quercus *dealbata* and *glabra*, may prove as hardy as the Ilex. The Kurdistan forms, especially *Q. Branti*, disregard cold, but do not like such frosts as that of April 24, which are in fact too much for any trees whatever in young leaf.

RHODODENDRONS of very recent introduction have as yet had no sufficient trial. It is, however, certain that *R. ciliatum* is hardy, and it is probable that *Thomsoni*, *fulgens*, *niveum*, *glaucum*, *Falconeri*, *cinnabarinum*, *Campbelliæ*, *æruginosum* will also succeed without protection; but the woolly *Rh. Edgworthi* is undoubtedly tender. It also appears from the observations of Mr. MASTERS, of Canterbury, that they all resist the cold badly if planted in loam, while in peat those just enumerated survived well.

No SPIRÆAS seem to have sustained material injury. The new Evergreen shrub SWAMMERDAMIA *antennaria*, notwithstanding its Australian origin, proves as hardy as a common Laurel; nor is the *Pittosporum bicolor*, from the same country, much more tender. In speaking of *Eucalyptus*, we have already pointed out how much there is to hope from experiments with Van Diemen's Land shrubs, and these cases materially strengthen the probability. We may take this opportunity of adding that the Eucalyptus called *montana*, which has proved so hardy in the south of England, is not *coccifera*, as we suspected, but is the Van Diemen's Land *radiata*, as we have learned from specimens communicated by Mr. LUSCOMBE of Combe Royal.

Lastly we have to record the unexpected fact that

the Assam Tea plant is hardy. Several small plants in the garden of the Horticultural Society survived without the smallest protection; and, what is still more curious, a young plant in incipient leaf was very little damaged by the frost of April 24, which killed all the young wood of the Walnut trees. This may be taken as a further illustration of what we have said while speaking of *Garrya elliptica*, showing how impossible it sometimes is to judge *à priori* whether a new plant is hardy or not. It shows that the question is one that can only be answered by direct experiment.

If we turn to a map of the New World, and cast our eyes to the north of the United States, a vast tract of land will be seen stretching north to the regions of perpetual ice and snow, and east and west across the whole of the immense continent of America. This huge territory contains more than four millions of square miles, more than 2630 millions of acres, and is equal to about one-ninth of the whole terrestrial surface of the globe. Nay more, it owns the supremacy of our own Sovereign Lady Queen Victoria, and *the British possessions in North America* are open to the enterprise and energy of Englishmen. If we examine a little more closely the south-eastern portion of the district in question, we shall find in Upper and Lower Canada a country with a healthy climate and immense resources, highly prosperous and rapidly increasing in population and importance. *The census of the Canadas*, published last year in Quebec, furnishes the materials from which we select the following facts in support of this statement. We confine ourselves more particularly to such details as bear upon agriculture and gardening.

The two Canadas consist together of an area of 242,482 square miles and 155,188,425 acres; of these last 7,300,839 are occupied and cultivated. The population is 1,842,265; so that there are, or rather were in 1852, four cultivated acres to each inhabitant; 164,488 persons, or a little more than one-eleventh of the whole population, are returned as farmers, whilst only 141,949 are returned as labourers; so that, even supposing that by labourer is always meant an agricultural labourer, there are actually 22,539 farmers more than there are labourers. This is in striking contrast with the condition of our own country. England and Wales, as appears from the census of 1851,* contain an area of 58,320 square miles and 37,324,915 statute acres. The population is 17,927,609; so that upon the whole there were, in 1851, little more than 2 acres to a person, or half the quantity which exists in Canada; indeed, even less than that, for the acreage of England and Wales, as given above, includes the uncultivated as well as the cultivated land. With respect, again, to our agricultural population, it appears there are in England and Wales 225,318 farmers, who employ 665,651 labourers, so that, instead of there being, as in Canada, fewer agricultural labourers than farmers, there are nearly three times as many of the former as of the latter. But from the list of occupations in the English census, out of the entire population of Great Britain, amounting to nearly 21 millions of persons, one million are set down as agricultural out-door labourers; so that although as compared with the farmers the number of labourers in England and Wales is much greater than in Canada, still, as compared with the whole population, the reverse is the case, for here only one person in 21 is an agricultural labourer, whilst there one person in every 13 is so. We confess that we should have thought that there had been more than three agricultural labourers for every farmer in England and Wales; but from a table in the English census it appears that as many as 91,698 persons returned themselves as farmers employing no labourers, and more than 33,000 as employing only one; these large numbers of course materially affect the average.

Leaving agriculture for the present, and turning our attention to horticulture, we find that in Canada (Upper and Lower) there are only 421 gardeners and 42 horticulturists, florists, nursery and seedsmen taken altogether. In Lower Canada there are fewer persons of this description than in Upper Canada, and it seems somewhat surprising that except in Montreal and Quebec there should not be a single nursery or seedsman throughout the whole of the former province, and that for the same district only one person should be returned as a horticulturist, and absolutely none as a florist. When it is remembered that the area of Lower Canada is nearly 210,000 square miles, and that its population is 890,000 persons, it does seem strange that only 149, or 1 in a little less than 6000, should be found making gardening and horticulture the business of their lives. Compare this with great Britain. The population may be taken at 21 millions, and of this number 80,946 (we may say 81,000) are returned as gardeners, exclusive of 5000 who are also domestic servants, and exclusive of 2675 nurserymen and of 1156 seedsmen. In England, Wales, and Scotland, therefore, there is one non-domestic gardener to every 260 inhabitants; or, in proportion to the population, 23 times as many as in Lower Canada. In Upper Canada there are both absolutely and relatively more gardeners, &c., than in the lower province; in the former, with a population of 952,000, there are 314 gardeners, florists, &c.; that is to say, there is one to every 3000 inhabitants; or, in proportion to the population, twice as many as in Lower Canada. Canada is not the place for luxuries; in the upper province there are only 94 barbers and hair dressers, or one to every 10,000 persons; and in the lower province there are only 30, or one to every 26,000; on the other hand, if we turn to the useful and necessary branches of industry we find 10,268 carpenters, 7075 blacksmiths, and 8967 boot and shoe makers.

The Canada census contains some very interesting returns relative to the agricultural produce of the country. From them it appears that in both provinces together there are 1,136,311 acres of Wheat, yielding in Upper Canada 16, and in Lower Canada 9 bushels per acre, and 13 and 3 bushels per individual respectively. There are nearly 78,000 acres of Rye, yielding on an average 11 bushels per acre; 329,755 acres of Peas, yielding in Upper Canada 14, and in Lower Canada 9 bushels per acre; 913,356 acres of Oats, yielding as before 26 and 20 bushels per acre; and 65,650 acres of Barley yielding on an average 21 bushels per acre. Barley is the only crop which it appears from the returns is yielded in greater quantities per acre in Lower than in Upper Canada. Wheat is in the tables valued at 4*s.* the bushel; Rye at 2*s.* 6*d.*; Barley at 3*s.*; Oats at 1*s.*; and hay at 40*s.* per ton. Horses are estimated at 12*l.* 10*s.*; milch cows at 3*l.* 15*s.*; oxen at 6*l.*; sheep at 7*s.* 6*d.*; and swine at 1*l.*

A rapidly increasing population is always admitted to be a sure sign of prosperity, and we cannot conclude the present article better than by the following facts relating to this subject. In the 10 years ending in 1851 the population of Great Britain increased more than 13 per cent., that of the United States more than 35 per cent., and that of Upper Canada more than 104 per cent. In the far west of Canada, the counties of Huron, Perth, and Bruce increased from 5600 in 1841 to 37,580 in 1851, being upwards of 571 per cent. in 10 years—an increase almost beyond comprehension. England has in the average 332 persons to a square mile; Wales, 136; Scotland, only 92; whilst Upper Canada has 29; Lower Canada, 4; and the United States, 16; so that the land even now occupied in Upper Canada would hold more than 11 times its present population, say 11,000,000 inhabitants, to be as densely peopled as England. In fact, about two-thirds of the population of London alone may be taken to represent the number of persons in all Canada.

In a late Number of the *Gardeners' Chronicle* (June 3, 1854) we ventured to say "that no part of the world now presents such undoubted opportunities of acquiring rapid independence as the British possessions in North America, and more especially Canada;" that opinion was founded more particularly on a pamphlet* then referred to, and is amply warranted by the official returns contained in the report from which the above details have been taken.

We would draw attention to some objects of great interest announced for sale by Mr. Stevens, next Tuesday. They consist of six of the famous double Cocoa Nuts of the Seychelle Islands, in a state of germination; some specimens, with male and female fructification, of the singular and extremely rare Stangeria paradoxa, a Cycadaceous plant, at first supposed to be a Fern; and what is said to be a new Ansellia, from the Zulu country. It is very seldom that plants of such importance are brought to the hammer.

VEGETABLE PATHOLOGY.—No. XLIII.†

190. A sufficient supply of the necessary elements having been secured, the next step is the employment of these for the exigencies of the plant. And this is effected under the agency of light by the fixation of carbon and the elimination of oxygen. Plants, in consequence, when exposed to light give out oxygen, while the carbon which was combined with the oxygen is fixed in the cellular matter of which the plant is composed, in the amylaceous and other substances which are destined for its nutriment, or secretions whose use in vegetable economy is not yet ascertained. But this is not all; there is a further liberation of oxygen in the more complex processes of vegetation. "In every part of the vegetable process, in the formation of every form of vegetable products of acids, neutral bodies, fats, oils, resins, basic and sanguinigenous matters, one character universally prevails, that namely of deoxydation of the materials and liberation of the oxygen.

"When we deoxydate any substance in the laboratory, we do it by causing the oxygen to combine with another body; but vegetables, while they produce all matters essential to their own development, give out, in doing so, the oxygen which is removed, and thus plants cannot grow without, as a necessity of their life, restoring to the air the oxygen withdrawn from it by the life of animals."* A constant balance is thus kept up, the animal world living entirely on vegetable products, and the vegetable virtually on mineral.

It may be well to give a few examples in a tabular form of different non-nitrogenous substances, whether acids, indifferent neutral compounds, other neutral bodies, oxygenated volatile oils, volatile oily acids, resins and camphors, or carbohydrogens.

		Carb. Acid.	Water.	Oxygen set free.
Dry oxalic acid.	C_2HO_4	$=(C_2O_4)-O$	$+HO$	O_1
Cellulose	$C_{12}H_{10}O_{10}$	$=(C_{12}O_{24})-O_{24}$	$+H_{10}O_{10}$	O_{24}
Mannite	$C_6H_7O_6$	$=(C_6O_{12})-O_{12}$	$+(H_7O_7)-O$	O_{13}
Oil of bitter Almonds	$C_{14}H_6O_2$	$=(C_{14}O_{28})-O_{28}$	$+(H_6O_6)-O_4$	O_{32}
Formic Acid	$C_2H_2O_4$	$=(C_2O_4)-O_4$	$+(H_2O_2)$	$+O_2O_2$
Resin	$C_{10}H_7O$	$=(C_{10}O_{20})-O_{20}$	$+(H_7O_7)-O_6$	O_{26}
Oil of Lemons	C_5H_4	$=(C_5O_{10})-O_{10}$	$+(H_4O_4)-O_4$	O_{14}

These examples are taken from Gregory, but given in a rather different form. Similar examples might be presented of more complicated substances, showing that oxygen is uniformly set free. One only shall be given, of a body which is copiously formed even in the absence of light in certain blanched stems.

Asparagine

$$C_8N_2H_{10}O_8=\left((C_8O_{16})+(H_4O_4)+(N_2H_6)\right)-O_{12}.$$

That is 12 equivalents of oxygen are set free.

191. Even in germination which normally takes place in the absence of light, substances are formed in which deoxydation occurs. Oxygen acts upon the albuminous matter contained in the cells, setting up fermentation, which induces the dissolution of the starch and other matters, rendering them capable of nourishing the plant: and as no growth in phœnogams can take place without the formation of new cells, and the outer membrane of these consists of cellulose, in the formation of which from carbonic acid and water, 24 equivalents of water are separated, so far as it may be supposed to arise in that manner and not from a mere modification of starch, oxygen must be given out. The true vital power of the cell is, however, fully exercised so soon as the cotyledons or plumule extend beyond the surface, even supposing it unequal to effect this end in the absence of light, which is beyond the power of human art to imitate, and the carbon is then fixed, and oxygen given out, while the other elemental bodies, as hydrogen from the water, and nitrogen and hydrogen from ammonia, with sulphates, phosphates, and a variety of other matters, combine to form the various compounds which are due to vegetation.

192. Phosphates and sulphates exist in greater or less quantity in most soils naturally, and form an ingredient in the water of many streams. Where these do not exist, or in very minute quantities only, the soil is barren and incapable of maintaining anything like luxuriant vegetation. The addition, however, of bone manure, or gypsum, or animal excrement, whether in the form of farm-yard dung or guano, provided there be a sufficient quantity of moisture to render them soluble, will at once produce a strikingly beneficial influence, and a few years of culture and continued care, will ensure success, wherever the outlay of manure does not exceed the probable return. The water which percolates the soil, being charged with carbonic acid, will gradually dissolve many substances, which by itself it could not affect; and in every case a portion of the carbonic acid contained in the water, whether derived from above, from deep-seated springs, or from the decomposition of manure, will be employed in this necessary process. It is thus that bones and shells gradually part with all their animal matter, though even in a fossil state they retain a portion of their phosphates. Fluoride of calcium, being much less soluble, forms a large portion of the residuum; but the phosphates often remain in such quantities as to make fossil remains a useful manure. Coprolites, which contain much bony matter, are in consequence collected in those countries where they abound, and are duly appreciated by many agriculturists.

193. It is most important in all these cases that artificial manure be not supplied at hazard, for not only may the expense be useless, but a larger quantity of some particular matter may be stored up in the soil than is requisite; and if it is in a condition to be rapidly soluble, the plants may suffer from too large a supply, which is sure to induce diseased action. The contents of the cells, which in all probability are, in almost every case, the fruitful cause of disease, being in an abnormal state, and one tending to change, fermentation takes

* The Census of Great Britain in 1851; Longman, 1854. By authority of the Registrar-General.

* Canada; its present Condition, Prospects, and Resources. Stanford, Charing Cross.

† There are some typographical errors under paragraphs 180, 181, and 189, which require correction. In 180, line 11, for "this" read "the residuum;" in 181, the word "acid" should be erased; and in the appended note, "combine with" substituted for "contain." In 189, line three, read "crenic and apocrenic." There are other less important errors in XLII, in consequence of an accident happening to the proof.

* Gregory, p. 475, Ed. 3, 1852.

place, and the cell walls themselves suffer, vital action ceases, and decay and death rapidly follow.

194. Merely chemical action will not account for all that takes place in the vegetable world. There is some law, whatever it may be, which produces effects which we cannot imitate; and it matters little what this law depends on, provided it be allowed that it is distinct. Vital action may be a series of effects due to some unknown cause; and whether that be designated by the term life, or by any other term, is matter of indifference. Certain it is that when vital action ceases in a single cell, chemical effects ensue in the normal way, precisely as they would in non-organised bodies; and the causes which derange such vital action are those which produce disease terminating in death, or in more partial disorganisation, according to their intensity. Were it not for this marvellous and mysterious property, there is no reason why we should not be able to produce, artificially, organisms such as are presented by the lower tribes of the vegetable world; and if a single living cell were once produced, there is perhaps no sufficient reason why we should not advance to higher organisms, as the steps by which they rise in the scale are so gradual. The breath of life, however, whether in a lower or higher sense, is something which must be breathed into inorganic matter by an intelligence superior to that of man; and unless we choose to cast off faith altogether, and to reduce ourselves to the condition of mere heathen philosophers, we may be content to wonder reverently at what, with our present limited capacities, we shall never fully understand. *M. J. B.*

COMBRETUM PURPUREUM.

Where space in a warm house can be commanded, this forms a most useful subject, producing its large feathery like panicles of bright crimson flowers, which last long in beauty, very freely. It is useless, however, to hope to do any good with it except where room can be at command to grow large specimens; for the flowers are seldom borne freely only upon the lateral, or second growths, and to have these strong and short-jointed, which should be the case, it is necessary to train the principal shoots thinly, and the plant being a free grower, a large sized trellis is indispensable.

This Combretum is generally found by amateurs to be rather difficult to propagate, but this is, doubtless, the result of not selecting fit pieces for cuttings; for short-jointed firm bits of young wood treated in the ordinary manner, root very freely, and these are easily obtained from pot-bound specimens. The cuttings should be potted singly in small pots as soon as they are sufficiently rooted, plunging the pots in a brisk bottom-heat, in a warm moist situation. When well established shift into pots about two sizes larger, and during the growing season afford the young plants a bottom-heat of 85° or 90°, with a warm moist atmosphere and all the light possible, merely shading them from direct sunshine on the forenoons of bright warm days. Endeavour, however, to get the cuttings rooted early in the season so as to have them well established and some size before winter, for it is not desirable to keep them growing after the beginning of November, for after that they should be treated with a view to getting the wood well ripened, placing them in an airy part of the stove and keeping them rather dry at the root. And it may be observed, that in the case of either young or old plants, it is necessary, in order to secure strong growth the following season, to thoroughly ripen the wood and afford the plants a period of rest, placing them while in a dormant state where a temperature of about 55° may be maintained by means of fire heat. As early in spring as circumstances will permit, cut the back wood to prominent eyes, and train the shoots nicely, keeping the points rather low; and remove the plants to a warm growing temperature, placing them near the glass, and giving sufficient water to the soil to bring this into a healthy moist state. Syringe over head on the afternoons of bright days, and if convenient to plunge the pots in a mild bottom heat this will greatly assist in getting the buds to break thickly. In the case of young plants, a small shift should be given as soon as the roots become active, and old specimens, to which it may not be convenient to afford larger pots, may have the ball reduced sufficiently to allow of using a little fresh soil, repotting in the same sized pots. And with the assistance of a little manure water, and slightly reducing the ball every season, specimens will do very well for years in the same sized pots, and will flower more freely than if a luxuriant habit of growth were encouraged by giving large shifts annually. Young plants should, however, be shifted into the pots in which they are to be bloomed, as soon as this may be considered safe, in order to allow of training the shoots to the trellis on which they are to flower. Attend carefully to the wants of the plants during the growing season, keeping them near the glass, and properly supplied with water at the root; and when the weather becomes hot protect them from the mid-day sun by a thin shade. When large well-furnished specimens are obtained, if they do not seem inclined to bloom freely they should be kept rather dry at the root for a few weeks, using the syringe only to prevent red spider gaining a footing on the foliage. This will check over-luxuriant growth, and greatly assist in promoting a flowering habit; but it will hardly be necessary to resort to any particular treatment in order to get well-grown specimens to bloom freely. While in flower the specimens should occupy a cool airy part of the stove, where the flowers will be safe from damp, and not exposed to bright sunshine. Or if desirable to remove them to the conservatory, this may be done, provided they are gradually prepared for the change of temperature, and can be placed in a close warm part of the house. For soil use equal parts of good rich fibry peat and light turfy loam, adding plenty of silver sand to keep the compost porous after the decay of the fibre.

Fine as this Combretum is as a pot specimen when well done, it may be had in larger masses, forming more striking objects, where it can be planted out in the border of the stove and trained to the rafters, where it will bloom profusely for months in succession. It is, however, well known to be one of the very best of stove climbers. *Alpha.*

SOME PRINCIPLES OF VEGETABLE PHYSIOLOGY,

BEARING ON THE CULTURE OF PLANTS.

By Professor W. H. de Vriese, of the University of Leyden.

(Translated from the Dutch.—Concluded from p. 645.)

The sleep of plants is that state of which we said a few words in the beginning, and in which we see the parts of flowers or leaves, which are at other times expanded, contract or fall together, because they lose their natural elasticity and turgescence, which is occasioned by the action of the sun's rays. The sleep of plants is in no respect to be compared with that of animals.

The barometer indicates the changes of weather, even before they are perceptible to our senses. We say that it forebodes them. In that respect also do certain plants. Not only do many flowers close up when it rains, but there are many plants which forebode rain, in the same sense as the barometer forebodes the changes of weather. Calendula pluvialis closes its flowers, and Porliera hygrometrica its leaves, when rain is about to fall. Warmth and dry air are necessary, which cause them to expand and evaporate strongly, to retain their natural size. Thed ampness of a cloudy or misty atmosphere, which precedes rain, causes the parts to fall together; this and the sleep of plants are, therefore, called hygrometric phenomena.

When the evaporation is disturbed, the plant becomes sick, notwithstanding the supply of nutritious particles by the root; this has appeared from observation and experiment. If the leaves are smeared with varnish, or any other glutinous matter which hinders the evaporation, then the plant dies, for the surface can no longer be active.

In July, 1845, there appeared, to an alarming degree, in one of the plants most generally used for food (the Potato) a disease probably not unknown formerly. Fields, which till lately had grown luxuriantly, showed only death and decomposition; the hope of the farmer on a large crop disappeared. Many people foreboded bad harvests for following years, and advised a change in the plan of agriculture. An extraordinarily hot summer weather preceded, followed by a sudden falling of the thermometer, heavy showers, and cold days. The plant, which had grown too luxuriantly, was at once disturbed in its growth and in its evaporation. The liquids were forced to remain in the plant; they had no means of escape, the tubercle was not ripe—the fæcula not yet formed, but, floating in an over-abundant water, stood still of necessity, and soon rotted; the leaves and stem withered and became rotten. That is, it appears to me, the simple, primary cause, and the course of a sickness which was a national calamity here and elsewhere, and the sad consequences of which we see more or less every year. The leaves are to be compared to the lungs and skins of animals; they remove from the body substances which could not, without damage to the organism, remain in the mass. But while they draw the saps upwards, they are nourished by them, and borrow from the fluids raised the substances necessary for their own development. At first white, thin, membranous, and tender in their construction, afterwards they become gradually thicker, more fibrous, sometimes hard as leather, dark green, and shining. Such is their state in the middle of summer; afterwards we see them lose their green colour, become yellow, and hang loosely down. Others become red; they acquire the particular colours that we call autumnal, and which impart to the woods and pleasure-grounds such a peculiar charm as to make us loath to exchange the woods and fields for the turmoil of the town. The Oak becomes brown, the black Beech whitens, the Ash loses its green colour, the Maple becomes yellow and black, the wild Vine of a purple colour, and the Cornel tree red and yellow; the whole presents a peculiar variegated mixture of the finest diversity of tints; but all this beauty is only the precursor—yea, it is even the beginning of an approaching dissolution and instant death. The leaves die—their whole relation to the atmosphere is changed, or even seems to cease. The upper layer, by the quantity of fluid which soaks through it, and of which some substances fasten on it, or affect the surface, changes, thickens—but in all is at last unfit for evaporation, and shut out from the air. Those regular successions in change of substances which we have noticed as the cause of growth, as such take place no more; another series of changes, in which the growth has no part, nor is even the consequence, takes place instead; external influences become, as it were, master of the body, which is now without the circle of life. The leaf, which is unable to discharge any more substances outwardly, can take up no more, becomes a useless appendage; it soon falls from the organ of which the life is not disturbed. The fall of the leaf, then, is not the consequence of the change of the seasons, for in tropical countries, also, this phenomenon takes place; it is the consequence of a changed state of life itself, of the disturbed connection between evaporation and absorption. In the month of August it was necessary, for local reasons, to strip two Linden trees of all their branches. They made new leaves, and they stand now (24th November) still green and fresh, although covered with snow, and lately there have been some severe night frosts. The cause of the fall of the leaves is not to be sought for originally in the atmosphere, but in the construction of those organs themselves. The increased action of life is the cause of death, on account of the change it brings upon the tissues, without which the leaves would not fall off, and the plants we call annual (that is, those which, within the circle of a year, develop themselves and bring forth seed) would not in so short a time die off, but, like shrubs and trees, would have an indefinite term of life.

Where should we end, if we wished to continue to enumerate examples of all that is to be ascribed to evaporation and its connection with absorption?—therefore we limit ourselves, and we repeat only this, that plants also take moisture from the air; that not only do the roots absorb fluids from the ground, but that the leaves inhale other substances which circulate in the air in the form of gas; that evaporation and absorption by green parts depend on the moisture of the atmosphere, on that of the plant, and on that of the ground; that the nature of plants is by these circumstances remarkably modified, and that on them depend the forms and properties which plants present to us in different latitudes, and in their various positions.

The knowledge of what we have now treated is not without practical utility. A good watering or draining of the ground is not of less importance for the cultivator than a good manuring. The water that a plant evaporates must also be brought into its roots. Where would be the limit of our treatise if we wished to try to make known all the great phenomena which vegetation by means of evaporation brings about in all Nature? Always, where there are woods, the state of the atmosphere is damp, and the ground for the most part fertile. The great streams of the earth have their origin generally in wooded mountains, and empty themselves at a great distance from them into the seas. Population settles on their fertile borders—culture, well-being, and civilisation keep pace. Where no vegetation is, there is the soil barren, the state of the atmosphere always dry; it seldom rains there. Men and animals flee from those withered and unfruitful regions. Wide districts of South America, where it never rains, and where there is no vegetation, may be cited as examples.

Home Correspondence.

Covering for Frames.—I notice that some of your correspondents are desirous of ascertaining what will make a good substitute for matting or other extensive materials for covering frames and pits. The general faults with all substitutes recommended are, weight, clumsiness, and their easy destruction. I beg to suggest the use of galvanised iron netting, and straw; the straw being placed between two pieces of netting, as thickly as desired, and the whole united at different points by wire, both to keep an uniform flat surface, and to prevent the straw escaping at the edges. A stout lath might be fastened at each end, whereby strength and a better holding upon removal would be gained. The iron wire is advertised at a low price, and most folks can find some spare straw. *C. F. Palmer, Southsea, Hants, Oct.* 21.

Anacharis alsinastrum.—I am sorry to inform you that we have found this plant here. I first noticed it last June, in a small stream, which runs past my nursery. It took possession of a small pool, formed by a bend in the stream, and though I was surprised at the sudden increase of weed, I did not pay it any particular notice when giving orders to have the place cleaned out. Being absent for six weeks, I was astonished, on my return, to find the entire surface of the place covered, a thing quite unusual; and, on examination, I saw plainly (from the description given in the *Chronicle*) that it was our new enemy. On looking up the stream, I find a small patch of it at a little distance, in a sheltered corner. This stream is a tributary to the river Lea, and the spot where the weed is growing is distant from it about 400 yards. From the place where the stream meets the Lea, to the timber-yards at Cork, is about one mile; and though there are many obstructions to the water, such as weirs, mills, &c., yet the tides out-top all. *H. Haycroft, Cork, October* 21.

Nimrod Strawberry.—About the end of last March I obtained six pots of this Strawberry from Mr. Pince, of the Exeter Nurseries. I planted them in a line, 3 feet, plant from plant. When the blooms had well appeared, I reduced them to three on each stem, and fearing the drought, I poured around each plant two quarts of pond water. The extremely dry weather still continuing, when the fruit began to colour, I repeated the water, and placed a narrow net over them to keep away the birds. When ripe and gathered, 15 of the fruit made a magnificent dishfull; 9 measured from 8½ to 10 inches each in circumference; 4 from 7¼ to 8 inches, and 2 measured 7 inches each, in circumference. The fruit is large, of a glowing scarlet, and well flavoured, strongly resembling the Elton Pine when eaten with some sugar, and well deserving a place in every garden. *P. Exeter, Oct.* 24.

Fertilising Ovules.—I was not a little interested in the account given by Dr. Hooker in your columns of experiments made by him, to ascertain the possibility of

fertilising the ovules in the seed vessels of phænogamous plants, by allowing the direct contact of pollen, independently of the stigmas. Dr. Hooker's experiments are certainly very extraordinary, and his results appear so satisfactory as scarcely to require to be tested by further experiments, or the testimony of others on the same subject. As, however, he calls for any further evidence that others may have to offer on the same or similar attempts, I cannot resist the invitation to mention my own humble efforts to accomplish a similar result to that which he has achieved. Some years ago, in 1850 or 1851, I cultivated pretty extensively the Calceolaria tribe; I sowed no seed but such as I had produced by cross impregnation. As the rage was then, as it still is too much, to appreciate no flower unless it was large, my effort for years had been to secure size as much as form. After many years, I did succeed in working up a thing which, for size, would have certainly satisfied the most fastidious gardener; it was the size of an ordinary Pippin, but in form it was just what a Pippin would appear if cut through the middle—flat on one side and convex on the other. The colour pleased me well, and the size was monstrous. Well, I thought I will make something out of this. Having plenty of others of the approved form to cross it with, I fell to work—fertilised every blossom as they developed—but, by and bye, I was vexed and annoyed to find that though I had wrought with bloom taken off many separate plants, in no one instance had the cross taken. In a word, I had discovered that I had crossed and crossed till fertilisation could no longer be effected. Yet I was loath to be baffled. I examined the stigma; it seemed unnatural; and it occurred to me that it was in fault. The idea suggested itself that the tubes by which the pollen is supposed to be carried down to the ovary were closed up or too delicate to admit the passage of the pollen dust. It then struck me to remove the stigma, which I did with a sharp penknife at various distances from the ovary, and immediately applied the pollen, just as I would have done to the stigma. But the result was unfortunate; none took. I did not, so far as I can charge my memory, try as Dr. Hooker did, cutting over the pistil at the ovary, so as directly to apply the pollen to the ovules, or leaving that to be done as nature might direct—by winds or insects. You will at once see that my failure does not in the slightest affect the success of Dr. Hooker's experiments. I wrought with a stubborn mule (I speak literally), the result of many crossings in an in, a thing utterly barren in its natural unimpaired condition. Dr. Hooker, again, wrought with fertile plants, and his experiments were different. If I am spared to another year I may next summer profit by the hints which the Doctor's most interesting trials have suggested. If others should try such experiments they should perhaps follow nature, and apply the pollen with an insect's wing, the gossamer of a spider's web, or the most delicate tissue. Much depends on this. I will be glad to communicate through your columns the results of my own humble trials, as I trust others will, on this most interesting investigation, so successfully begun by Dr. Hooker, which I trust he will himself pursue still further. *Isaac Anderson, Maryfield, Edinburgh.*

Chick Peas.—I have sent you some portion of a quantity of Barbary Peas which I bought lately in Liverpool, I paid 38s. per quarter of 504 lbs. for them; and I find them excellent food for horses and pigs, and, indeed, they make excellent soup for the table; but I scarcely think they are Peas. I enclose you some of the pods I found amongst them. Would you kindly say what they are? I understand they can be shipped in large quantities if required. *Julius.* [They are Chick Peas, the produce of Cicer arietinum, and have a great reputation, when split, as the best kind of Pulse for making soup.]

Barking Oak Trees.—I am glad to see a discussion on this subject opened in your Paper of October 12; I hope it will continue, and be extended from barking to other branches of arboriculture. The system of felling Oak trees before they are peeled is bad, and attended with disadvantages, some of which I will endeavour to point out. In the first place, when a large tree is fallen without first being divested of its boughs, the timber is very often split and broken so as to deteriorate its value very much: arms suitable for boat-knees, and valuable for other purposes, are often rendered good for nothing but the cordwood rank; and the bole of the tree is not unfrequently shaken and split nearly to the centre by the strongest heavy-topped boughs separating themselves from the parent stem when the tree falls. Secondly, not only is the fallen tree injured, but its surrounding neighbours often feel the weight of its large head making its way to the ground. Many fine thriving trees, which were intended to grow for 20, 30, or 40 years longer, get so much mutilated as to render it necessary to have sentence of death passed against them in the prime of life and vigour. Even if they are left standing, if only injured by the falling tree to a small extent, of course their growth is more or less retarded for a number of years to come. Thirdly, the cost of peeling the trees after they are fallen is not less, but considerably more. The same rate per ton is paid in this neighbourhood for peeling either way; but about double the number of men must be employed to peel the same quantity of bark when the timber has to be fallen at the same time, not only because the falling occupies as much time as the peeling, but when a large tree is fallen before it is peeled it requires turning over, an operation which must have the aid of the united strength of all the hands present. Again, when trees are down, carts cannot so conveniently get to the bark, so that extra men must be employed to carry it to the carts, independent of those who work by contract. In a general way, two men will peel the bole of a tree in as little time as six men will peel the branches. When the trees are left standing, the man who ascends to peel the bole begins his work by lopping off the branches, which are still peeled on the ground. He then begins to strip the bole, which an expert workman will accomplish in as short a time as three others will strip the branches below and set or bed the bark to dry. Woodmen who are accustomed to the work always prefer to peel standing when the bark runs well. It is a matter of importance to get as much bark off as possible in little time, the peeling season is always limited, and some years of very short duration, whilst falling may be proceeded with at convenience. *G. Buchan, Bakewell, Oct.* 23.

Orchis variegata.—I recently purchased some tubers under this name. They are entire heart-shaped roots, not palmate; and are not, or ought not to be, mascula—inasmuch as both that and O. morio were sold at the same place under their own names. It must, I think, be the synonym for some better known name; can you tell me for what? There was also something called Orchis pallens; can you tell me what that means? *A. H.* [Orchis variegata is a common species in the south and east of Europe; there is plenty of it in the Crimea. There is a bad figure in the "Botanical Register," t. 367; the tubers are oblong and undivided. Orchis pallens is a pale yellow species, figured in the "Botanical Magazine," t. 2569, under the name of O. sulphurea.]

Potatoes from Cuttings.—We have forwarded you a few samples of Potatoes, all grown on strongly manured land. We have dug all up except No. 8. None were planted until after the 20th of May last, and none of the sorts will be good for eating, as not less than 20 tons of manure were put to the acre. No. 8 is a fair sample as taken up with from 9 to 12 inches of the haulm nearest the roots, quite sound, although the tops appear blighted. We have found ever since we commenced growing Potatoes from cuttings that the haulm is more wiry and hard than in those grown from tubers. No. 1, Early American Potato, from tubers first year, from Drummond's stock; 20 in the bushel diseased; produce, 240 bushels per acre. 2. Cuttings from the above; 6 in the bushel diseased; produce, 320 bushels per acre. 3. Early Oxford Potato, from tubers, fourth year from cuttings; no disease; 160 bushels per acre. 4. Ditto, from Cuttings, fifth year; no disease; produce, 200 bushels per acre. 5. York Regent, from tubers first year; 25 in the bushel diseased; produce, 240 bushels per acre. 6. Ditto, from the above, first year; 12 in the bushel diseased; produce, 200 bushels per acre. 7. Ditto, from tubers, fourth year from cuttings; no disease; produce, 320 bushels per acre, 8. Ditto, from cuttings, fifth year; no disease; produce, 240 bushels per acre. *Hay, Sangster, and Co.*, 18 *and* 19, *Cumberland Place, Newington Butts, Sept.* 28. [After a careful examination of these samples we are at a loss to know what they show, except it be that a great quantity of tubers may be had from cuttings. The specimens were generally small or coarse and bad; most of them merely "chats." Among Nos. 7 and 4 we found diseased Potatoes.]

Hardiness of Plants.—As you still invite contributions relative to the effects of the past winter on our Pinetums and gardens, I beg to furnish you with a few facts from this place; and, as we have planted our Pinuses "sectionally," or according to the number of leaves generally found in a sheath, I have made out my report in accordance with that arrangement. Those marked with an * had caps formed of Furze branches placed over them; this precaution we generally adopt with little known species whilst the plants are small, and also with such as we find rather tender, or apt to suffer from unusual severity of weather and late frosts. We entertain the idea that they are less liable to injury as they grow in height, the air being drier than upon the surface of the ground, consequently the wood gets better ripened. Commencing with the "*Binæ*," or two-leaved section, halepensis has been very slightly injured—Carica has been more hurt than halepensis; japonica,* muricata, and padufiana* are uninjured. In the "*Ternatæ*," or three-leaved section, Teocote, patula,* and palustris* have been slightly injured; Benthamiana (which promises soon to make a magnificent tree) insignis, tuberculata, Cembroides, Bungeana,* and Llaveana are not injured: the last-named will, I think, make a beautiful tree, although short-leaved, and of slow growth. "*Quinæ*," or five-leaved section:—Macrophylla, of this species we had two most beautiful specimens, one upon an eminence, where it caught the early morning sun whilst in a frozen state, during the severe late spring frosts, has been killed; the other specimen, not fifty yards distant, but sheltered from the early sun, is not injured; Hartwegi* has been killed; Russelliana, Montezumæ, occidentalis, apulcensis, Skinneri,* Ayacahuite, and Lindleyi, are uninjured. Of Devoniana* the foliage is much hurt. Of Abies and Piceas I would remark that the early spring growing kinds have suffered much the same here as at other places. A. Smithiana and Morinda have grown beautifully, but are much disfigured by the late frosts this spring. Brunoniana* is making a handsome plant, though injured severely. The early growth of Picea cephalonica, Pichta, and Webbiana was also injured by late frosts; religiosa* escaped injury; Cunninghamia lanceolata is hardy here; Cupressus sempervirens, lusitanica,* thurifera, and Mexicana have been slightly injured; macrocarpa, torulosa, majestica (a variety of torulosa), Goveniana, funebris,* dicœcia, Corneyana, and Knightiana* are uninjured; australis, juniperoides, pendula, and Uhdeana have been killed; Knightiana was killed half-way down by the winter of 1852-53; it made a vigorous growth last summer, and has wholly escaped this winter. Sequoia sempervirens is perfectly hardy, and grows magnificently in a red marl. Taxodium Horsfalliæ is also hardy, in a sheltered situation. Juniperis bacciformis, dahurica, oblonga and oblonga pendula, hibernica, cracovia, Wittmaniana, Bedfordiana, Sabina and its varieties; Virginiana and its varieties (including Chamberlaini), phœnicea, Lycia, thurifera, excelsa, squamata, recurva, and recurva-densa (a charming, compact, bushy variety), canescens, serillocarpus, chinensis, and c. fœmina, Gossainthania,* flagelliformis, fragrans,* sphærica,* and alba; none of these were injured during the past winter, although a plant of Gossainthania was killed by that of 1849-50; drupacea,* flaccida, occidentalis, and canariensis,* have been severely injured; neoboriensis,* tetragona,* Bermudiana,* have been killed; Torreya nucifera was planted in 1849, and has never received any injury—it is perfectly hardy. Our reports of the Cephalotaxus agree with yours, viz., that it is hardy. Fitz-Roya* is not visibly injured, but it has not grown this season. Saxe-Gothæa is hardy. Of Dracæna indivisa, one plant is killed; another, in a higher and drier situation, has had its top killed, but has grown vigorously from the root. Berberis macrophylla is killed; B. nepalensis has had its top killed, but has grown vigorously from the roots; Fortuni is uninjured. Escallonia macrantha has been killed to the ground; the roots, however, have thrown up strong shoots. Arbutus Unedo, Andrachne, and procera, have all endured the winter with very trifling injury. Pistacia mutica,* Edwardsia microphylla,* Ligustrum japonicum, laurifolium, and Viburnum japonicum, against a south wall, have endured the frost with but little injury. Yucca aloefolia and aloefolia variegata are killed.—*C. E. Wells, gardener to T. Gambier Parry, Esq., Highnam Court, Gloucester.*

Benthamia fragifera.—This stood the winter well at this place, which is on the north side of the Southdown hills. It has blossomed, and I expect it to ripen fruit if the weather keeps favourable, as there are several dozens on the plant. *J. Gadd, Bignor Park.*

New Plants.

97. Salvia porphyrantha. *Decaisne in Revue Horticole, 4 ser.*, vol. iii., *p.* 301, *fig.* 16.

Under this name has been published a very pretty plant, the origin of which is unknown, but which is kept in the greenhouse in winter and used for bedding out in summer, for which the facility with which it strikes from cuttings renders it particularly well suited. In appearance it is much like the beautiful *Scutellaria cordifolia*, alias *splendens*, each branch terminating in an erect raceme of brilliant scarlet flowers, not inferior in intensity to those of Lobelia fulgens. The leaves, which are small, roundish, heart-shaped, and very much wrinkled, stand upon a slender purple stem, and have nothing coarse or weedy in their nature. It is not stated whether or not this species casts its flowers as easily as is the case generally with Salvias; if not it will well deserve trial in this country; at present we only know it from the account published in Paris.

98. Pitcairnia echinata. *Hooker.*

"This species is figured and described in the 'Botanical Magazine' (t. 4709), from a specimen sent by us to Kew; it is also noticed in the 'Flore des Serres' (viii. 257): but in neither of these publications is any mention made of its general appearance, for which it is as remarkable as for its muricated flowers. The stem is erect, covered with black scales, 4 feet high, and is terminated by a crown of denticulated ensiform leaves 2 or 3 feet long, and at a distance giving to the plant the appearance of a Yucca or *Pincinectitia* (*sic.*) Two varieties were found in the forests of the province of Soto (New Grenada), between Matanzas and Bucaramanga; both are terrestrial, but the flowers of one are sulphur coloured and red at the base, whilst those of the other are of a beautiful red salmon colour. Both varieties are equally interesting, and may be recommended as well for their flowers as for their ornamental character." *Linden's Catalogue.*

Garden Memoranda.

S. Rucker's Esq., West Hill, Wandsworth.—The magnificent collection of Orchids, for which this place is so justly celebrated, is at present in as fine condition as ever we remember to have seen it; and the plants have this year made unusually strong growth, which owing to the bright weather we have lately experienced, has got well ripened. An extraordinary display of flower may therefore be expected. Most of the Dendrobes have finished growing, and have been put to rest for the winter, as are also the Cattleyas, among which are some remarkably fine specimens. The heat and moisture in the house in which they are now kept, and in which they delight so much while growing, have, as a matter of course, been greatly diminished, in order to harden the more tender shoots and fit them the better to withstand the dull weather of winter.

Among plants at present in bloom in the principal Orchid-house, we observed the singular-looking Catasetum saccatum; a purple variety of the bearded Lady's Slipper; a pendulous variety of Cycnoches barbatum; Angræcum bilobum; the ever flowering White Butterfly plant (Phalænopsis amabilis), Vanda tricolor and insignis, the somewhat scarce Chysis aurea,

with two long shoots, each terminating in clusters of orange and white blossoms; beautiful specimens of Dendrobium formosum, than which what plant can be handsomer, its clusters of numerous large white blossoms stained with yellow being extremely cheerful and showy at this season. Associated with the above were also the delicate little Burlingtonia decora, with purple-spotted flowers and white lip; the slender variety of Oncidium Papilio called pulchellum; and the charming little Sophronitis grandiflora. Among remarkable plants not in flower were some enormous Aerides, and a huge mass of the spotted Saccolabe in a wire basket upwards of 3 feet in diameter; also Vanda Batemanni, which had made very strong growth, and Cattleya superba, one of the very best of the Cattleyas; the latter promised soon to be a mass of blossoms. A specimen of Dendrobium densiflorum, which had had 70 noble racemes of yellow blossoms on it last year, looks as if it would be even finer next year. On the tops of many of the pots were Lettuce leaves, placed there for decoys for slugs, which, when they come out in the evening to feed are caught and destroyed.

In one of the stoves Calanthe vestita, the red-eyed variety, was just opening its blossoms. This, we need scarcely say, is greatly superior to the white kind, which is sometimes sold for it; but which is not half so handsome. Odontoglossum grande, Barkeria Skinneri, some Ixoras and Amaryllises were also in bloom here, as was also a plant of Stephanotis floribunda, trained along the roof. Pomegranates, in pots, had just been brought into this house for the purpose of gently forcing them into flower.

In a division of the Cattleya house, which is now comparatively cool and dry, was a charming boxful of the different kinds of Anæctochilus and Physurus, whose gold and silver veined foliage is so interesting at all seasons, but more especially now when there is little else to attract attention. The pots have been plunged in potsherds and charcoal (which act efficiently as drainage) and surfaced with sphagnum. This box has a glazed top to it, hinged at back, to allow it to be lifted up when wanted; and managed in this way the plants appear to thrive uncommonly well. Opposite them, on the other side of the pathway, was a very fine collection of Pitcher plants, which are grown on and prepared here for the larger houses. Though the plants were comparatively small, yet they were well furnished with pitchers, the handsomest of which were those of N. sanguinea, though a few very fine ones might be obsmaller ones on N. lanata, a rare addition to this singular tribe of plants. In a cool corner were various Sarracenias, the handsomest of which was S. Drummondi, the top of whose long green tubes or trumpets assumes a delicate white colour embroidered all over with a beautiful red network. There was likewise here a fine plant of the dwarf S. purpurea splendens, and we observed a capital specimen of Cephalotus follicularis with not fewer than 40 pitchers on it, large and finely marked. The interest which belongs to so rich a collection of such plants may therefore be more easily conceived than described. Of Lycopods there were likewise some pretty kinds, one of the best of which was a circular mass of L. rigidum, which measured more than 18 inches in diameter, though in some places we have heard it cannot be made to grow. The pretty little Cœlogyne Wallichi was just opening its flowers, which will remain in beauty for many weeks to come; and along with it we observed the somewhat scarce C. laginaria. These are useful winter plants, which are not so much grown as they deserve to be.

The water-house or aquarium is now, as it always is, an extremely interesting place, on account of the variety of objects which it contains. In the water are various Nymphæas, among which dentata is now in bloom, as are also the two red kinds, Devoniana and Ortgiesi, a sort like Devoniana, but paler and perhaps a trifle larger. Over the tank are suspended Orchids in baskets, and some beautiful specimens of Ferns. Among the latter a fine plant of the oak-leaved Drynaria was especially remarkable, its handsome fronds measuring quite 3 feet in length, and nearly surrounding the earthenware basket in which it was growing. This is truly a fine species for this kind of decoration. Placed round the water were many other rare and handsome Ferns, among which were examples of Adiantum Fovеanum, Asplenium Belangeri, a charming species; together with Nephrolepis davallioides, Davallia pulchella, Platycerium crinitum, and the more common Platycerium grande, &c. Pitcher plants in great variety also grow, and form pitchers here in the greatest possible perfection. Those on Rafflesiana were unusually large and fine; and it may be interesting to observe that those near the base of the plant were of the ordinary form, while those farther up the stems were so very much longer, and altogether so different in shape as to be easily mistaken for pitchers belonging to another species. Of plants remarkable for fine foliage in this house, there were some Palms, the orange-veined Cossignia borbonica, Cissus discolor scrambling along the roof, the silver-striped Maranta vittata, and M. Warszewiczi, a handsome new variety in the way of zebrina; but more beautifully marked, and the purple on the undersides of the leaves deeper coloured than in that kind.

The principal show house is divided into greenhouse and stove, or cool and warm compartments, by means of a corridor running through its centre. The stage of the cool side is now filled chiefly with Camellias, which are well furnished with bloom buds, and round the shelves were such winter flowering plants as Erica caffra nana, and hiemalis, Ageratums, Tree Carnations, Æschynanthus speciosus, Croweas, a noble specimen of Statice Holfordi, with three magnificent spikes of bloom, and little standard Laurustinus. The last are plants well worth growing for many kinds of indoor winter decoration. We also observed here a specimen of Lucuma deliciosum, which appeared to be doing well in the cool temperature of this house. In the warm compartment the plants were in the most luxuriant health, and although, as might be expected at this season, there was little in bloom beyond Epiphyllums, Gesneras, and Ixoras, there was enough to interest in the shape of plants with fine foliage. Among the latter we remarked Coleus Blumei, Croton pictum, Dracæna ferrea, a very fine specimen; Jacarandas, Marantas, Musas, and the large-leaved Coccoloba guatemalensis.

In the corridor just mentioned a specimen of Littæa geminiflora is about to blossom; it has thrown up a flower stem which is already some 7 or 8 feet in height; but it will doubtless be higher, as the flowers have not yet shown signs of opening.

In front of this range of houses were beautiful pyramidal and standard Bay trees in boxes. When set on the side of a broad gravel walk, near a building, as these were, such plants have a unique and imposing appearance.

In a span-roofed promenade some 80 feet in length, several fine plants of Witsenia corymbosa were in bloom, and Plumbago capensis was also one mass of blue flowers. In the borders of this house were many rare Conifers, among which we noticed fine specimens of Dacrydium Franklini, Thuja Doniana, and Biota glauca. There were also Chrysanthemums and other plants calculated to keep the place gay in winter. While speaking of Chrysanthemums, we should not forget to mention that one of the greenhouses is at present entirely filled with them, in the shape of beautiful plants that must, when fully in bloom, produce a most striking effect.

We need hardly add that out of doors as well as under glass everything was in the best of keeping, the majority of the scarlet Geraniums and other bedding plants still retaining much of their gaiety. Heliotropes, however, although covered at night, have suffered from the late frosts.

FLORICULTURE.

Fuchsias.—The time is approaching when these must be started into growth. By February the young plants should be well established in 3 or 5-inch pots, and the old ones ready to receive their second shift. At this time the plants should be stout, thrifty fellows, with clean bright transparent stems and foliage, and young lively roots protruding all over the surface of the soil; and if in this state, they may, by proper treatment, be grown to any size. A good single-stem specimen of Exoniensis, when well grown, should be six feet in height, with branches drooping in regular succession from the pot upwards, and it should be a perfect mass of foliage and flowers; and other kinds, according to their habits of growth, ought to be equally perfect. To return, however, to the plants, we must now prepare for the second shift, and for this purpose a compost consisting of two parts turfy loam, one part sandy peat, one part half-decomposed leaf-mould, with a handful of small charcoal, and a liberal supply of coarse sand, must be thrown together and thoroughly incorporated, taking care to break it as little as possible. At each subsequent shifting of the plants, excepting the last, the same compost must be used, but at the final potting it will be as well to substitute equal portions of strong loam, and three-years-old cow-dung, for the one part of peat before used; as this will make the compost of a more adhesive character, the plants will consequently not require so much water during the hot weather. In shifting the plants, take care to drain the pots properly, by using five or six oyster-shells, and some rough charcoal, placing some of the roughest of the compost over the drainage. Remove the plants at each shift into pots at least three sizes larger, for though it may not at all times be convenient to adopt the one-shift system, I believe there are now no good cultivators who think of practising the old small-shift system. It is impossible to say how frequently the plants will require shifting, but if they are growing vigorously, they will never go more than six weeks from the time they are first potted until they show bloom, without requiring a larger pot. The best situation for the plants during the first part of their growth will be a low hot-water pit, where they can be kept near the glass, giving them plenty of air both night and day, and abundance of atmospheric moisture, but taking care to shade them thinly during bright sunshine, as the foliage is very liable to burn. As the plants progress in growth and get too tall for the pit, remove them to a house kept at a temperature of from 55° to 65° or 70°; place them near the glass, give plenty of air and moisture, occasionally moistening the paths, walls, and stages with clean manure water, and dew the plants over both morning and evening with clean tepid water. If these directions are attended to and carried out, there need be no fear of the red spider attacking the plants; but should that pest make its appearance, lay the plant down on its side and syringe with clean soot-water until every insect is washed clean away. Throughout the whole season it will be advisable to water the plants twice or thrice a week with manure-water, formed by mixing one bushel of sheep's dung, one peck of soot, half a peck of guano, and half a peck of lime; put the soot and manures together and mix them into a puddle with boiling water, and then throw in 50 or 60 gallons of soft water and the lime; stir the water frequently, and after it is quite clear, add two gallons of clean water to every gallon of the manure used, and apply it in a tepid state. It is astonishing what vigour this water imparts to the plants; indeed, all other things being suitable, they seem to revel in it with that luxuriance that makes them really delightful to look upon. So far my directions have been addressed to the productions of fine exhibition specimens, but now we will consider the management of the tribe where there is only a greenhouse to grow them in. Here then, if very large plants are required, it will only be necessary to spur the young shoots in, retaining the old wood or stem; but if dwarf plants are preferred, cut the old plants down to the pot in autumn, reduce the roots, and repot in smaller sized pots, using the same compost as before. These plants may be placed under the greenhouse stage during the winter, and be kept tolerably dry, and by this time in the new year they will be pushing young shoots. Remove them to the warmest corner of the greenhouse, and expose them to light, and as they progress in growth repot them as frequently as they seem to require room. They will not be in bloom so early as better grown ones, but will make very nice plants for the autumn decoration of the greenhouse. Young plants struck in March and April, if properly encouraged by the necessary pot room and liquid manure, will also make very useful stuff; for the autumn plants, so managed, are generally the best for setting about in the flower garden or vases, as, being less brittle, they are not so liable to be broken by the wind as more luxuriantly grown specimens. In the flower garden, the management of Fuchsias consists in planting them in good, well trenched ground, of manuring them annually with a good dressing of leaf-mould, which also serves as a protection during winter, and also of soaking the ground occasionally, during their growing season, with liquid manure. It is not advisable to cut them down in the autumn, but to leave the old stems standing until the young shoots break up in the spring. Old plants which have been grown in pots are the best for planting out, but where it is necessary to plant young ones they should always be propagated the autumn prior to planting out. Some of the old species and varieties, such as F. coccinea, virgata, conica, Riccartoni, and formosa elegans are best for planting out, and F. fulgens also makes a fine bed. Single specimens of Fuchsias are also fine objects, on lawns especially; when they get large in such situations they should always be guarded by baskets to prevent them from being injured in mowing. *S.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Let whatever watering may be necesary here be done early in the day, in order to allow of getting the superfluous moisture dispelled before night; for there is more danger from damp among plants in flower at this season, than from a comparatively low temperature. Therefore, if necessary to secure a dry state of the atmosphere before night, use a little fire-heat with air during the day. Advantage should be taken of unfavourable weather for out-door operations, to get the foliage of such things as Camellias, Oranges, &c., well cleaned. This is a practice which is not nearly so general as it should be, for it is hardly less essential to the health of such plants that their foliage be kept clean and active, than it is that their roots should be in a healthy state. It is unfortunately a somewhat tedious operation to wash the leaves of a large specimen singly by hand; but this will seldom be necessary, as most plants may be cleaned effectually at this season by laying them on their side and well washing the foliage with water at 130° or 140°, and if it is used 10° or 15° warmer it will do no injury, applying it with the syringe or engine. But any specimen that may be very badly affected by scale, should be gone over with a dry brush first, as it is nearly impossible to clean such by means of hot water only, without injuring the foliage. Timely and frequent applications of hot water, will, nevertheless, do much towards preventing the necessity for resorting to the tedious operation of cleaning by means of a brush or sponge, and if this is used there will be comparatively little difficulty in keeping the foliage clean, and the plants will always have that healthy appearance which is so desirable. Cinerarias for early flowering should now have their final shift; and if the pots can be placed on a spent bed, where they will receive a little bottom heat, this will greatly assist in securing active growth. The atmosphere must, however, be kept cool and airy, to prevent mildew, and if this pest is perceived apply sulphur at once. Late Chrysanthemums should be placed under glass, or where they can be protected from frost, for they cannot be safely trusted to the mercies of the weather after this season. Give them plenty of manure water, and afford them all the light and air possible, in order to keep the foliage, &c., vigorous, and prevent mildew. Stove.—A separation of the usual inmates of this house is absolutely necessary at this season in order to do justice to all, for things being grown for blooming in winter will be benefited by a moist rather warm temperature, while others which are in a dormant state, or should be so, ought to be afforded a dry atmosphere, and be kept comparatively cool, and this is difficult to effect in one house. It is, therefore, advisable, where circumstances permit, to remove such

things as have made their season's growth, and require a period of rest, and such as are being rested after flowering, to a house where the night temperature can be kept at about 50° or 55°, with a dry atmosphere. If a gentle bottom-heat can be afforded to the Begonias and other winter-flowering stock without placing them at a distance from the glass, this will be of much service in promoting active vigorous growth, and manure water should also be used, especially for specimens that are rather under-potted, giving it in a clear weak state, and cautiously at first.

FORCING DEPARTMENT.

PINERIES.—Fruit approaching maturity and expected to be of moderately good quality, must not be kept in a damp stagnant atmosphere, neither should it be rendered excessively dry by the moderate use of fire-heat. The fires should be kept going briskly during the day in cloudy weather, giving a little air; discontinuing, or nearly so, the use of the tanks or evaporating pans as may be necessary to preserve the atmosphere in a healthy state. Aim, however, at securing a rather high temperature, say 65° to 70° at night and 10° higher by day with the aid of the sun. If these conditions can be complied with, and if all is right at the roots, there will be no danger of the fruit being stringy or flavourless, which is often the case with Pines ripened in November and December. Plants showing fruit must be carefully guarded from damp until they are fairly out of bloom, otherwise the pips may set badly, which would cause the fruit to be ill-formed. Unfavourable as the present season is for ripening fruit we have nothing to expect for some months to come but a gradual decrease of light, &c., and where it is not of importance to have the fruit ripe at a particular time, every advantage should be taken of bright days to maintain a high temperature and get the fruit ripe as soon as possible. Pay attention to the state of the soil as to moisture, and give as much tepid manure-water as can be done without getting the soil too wet.

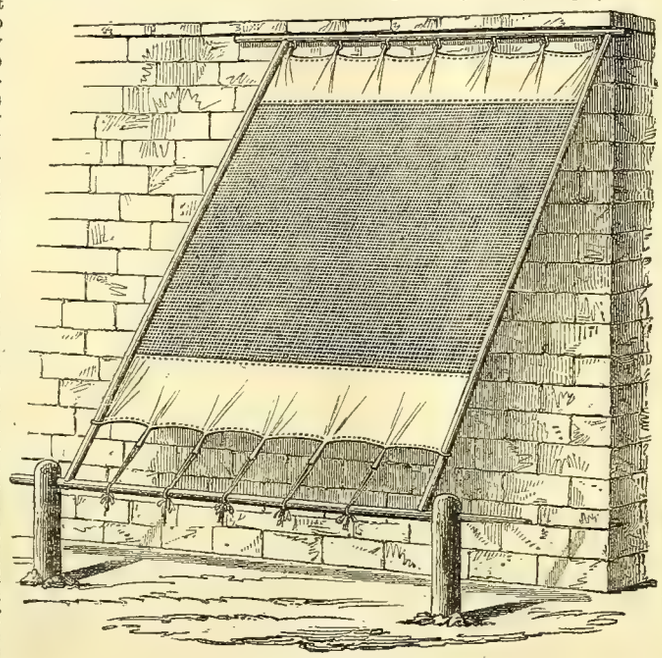
VINERIES.—Ripe fruit must be frequently looked over, cutting out any decaying berries, and if the bunches have not been well thinned, the inner berries must be carefully examined. Avoid, if possible, having any pot plants in houses where the fruit is intended to hang for any length of time, and keep the temperature as low as may consist with a dry state of the atmosphere. Wherever the fruit is cut and the wood ripe get the Vines pruned at once, in order to allow time for the wounds healing, and to avoid bleeding.

FLOWER GARDEN AND SHRUBBERIES.

Let us once more remind those whom it may concern of the advantage of using every possible expedition with new work or alterations, particularly in cases where large shrubs and trees are to be transplanted. This kind of work cannot be done too soon after this season, as, if delayed much longer, the plants will have but little chance of making fresh roots before winter, and will consequently be much more liable to suffer from the March winds, and will also require watering, &c., next spring; whereas, plants lifted last, or the beginning of this month, will require but little attention in spring. In our own opinion the best season for removing large plants is past; but the longer it is delayed after this the greater will be the risk of their not succeeding. And it is moreover advisable to get new work out of hand as soon as possible, as it can be done much more comfortably and cheaply now than after the days get short and the weather unfavourable. Late rooted cuttings not yet established after potting off should be kept rather warm and moist, to encourage a little growth, and if they can be placed where there is a gentle bottom-heat, this will greatly facilitate the succession of roots, and also allow of giving air to keep the plants from making weak growth, which they are very apt to do when placed in a warm close atmosphere after this season. Plants that are fairly established in their winter pots or pans should be freely exposed to the air on every favourable occasion.

HARDY FRUIT AND KITCHEN GARDEN.

Any fruit remaining on the trees may now be gathered except Pears, being left to retard their season of ripening, for there will be little gained by allowing them to remain longer on the trees, and there will be much risk of their being blown down and bruised. Keep the fruit-room cool and airy; but Pears approaching maturity will be improved in flavour by removing them to a warm dry room a few days before they are wanted for use. Proceed with the transplanting or root-pruning of trees that are not of a fruitful habit of growth, as soon as they are cleared of the fruit; also see to getting ground prepared for fresh plantations, for the remarks above with regard to planting evergreens, &c., at once, are also applicable to fruit trees. Wall trees will soon begin to demand attention, and now is as good a time as any to discuss the subject of spring protection. We learn from the "Journal of the Horticultural Society," that the following method of protecting this wall fruit from spring frost has been practised for several years, with great success, by John Harrison, Esq., F.H.S., of Snelstone Hall, near Ashbourne, in Derbyshire. A rod is placed horizontally beneath the coping of the wall. Another horizontal rod is fixed upon posts 3 feet from the bottom of the wall, and 18 inches from the ground; the two horizontal rods are connected at intervals by slight braces or rods, as is shown in the annexed woodcut. A covering, prepared by sowing woollen netting, on its upper and lower edges, to coarse calico, is then attached to the upper rod by loops and to the lower by pieces of tape; when the protection is complete. Mr. Harrison states that the cost of the worsted net (which is 2 yards wide), is 1*s.* 8*d.* per yard running. The calico 1 yard wide is 2*d.* or 2½*d.* according to quality, and when used is slit down the middle, and one half being sewn to the top, and the other to the bottom of the net, the covering becomes 3 yards wide. The tape and making up he finds of small cost, while of poles he has abundance of no value. The whole together in London, where every article has to be purchased, ought to be under 2*s.* a yard running, including making and putting up. The



walls at Snelstone are brick, 11 feet high, with stone coping which projects about 2 inches on each side. The trees are unnailed before winter, and fastened loosely to the wall, to prevent their being broken by the wind. In this state they are kept until they are ready to burst into flower, the object being to retard vegetation at that season as much as possible. They are dressed with the following composition, namely:—Take equal quantities of sulphur vivum, scotch snuff, and unslaked lime, the lime to be sifted through a fine sieve. Then add half quantities of lamp-black, and mix the whole with urine and soft soap-suds to the consistency of thick paint. The old and young wood is dressed with this with a painter's brush, after the trees are pruned, after which they are nailed all from the upper side of the leading branches. Mr. Harrison's walls are flued, but the fire is used only to ripen the fruit in succession if required, and in a very wet season to ripen the wood after the fruit is gathered. The flues are never used in the spring. The advantages of this netting are very great. The walls at Snelston contain eight Peach and eight Nectarine trees. The netting is fixed up and taken down in two or three hours, is set up when the blossom cannot longer be kept back, and remains permanently fixed, until taken down about the latter end of May, when all danger from frost is over. The gardener can walk and work under it, to nail or disbud the trees; there are no blistered leaves, and the first shoots always ripen their wood, insuring fruit for the following year. Last year, upon these eight Peach and eight Nectarine trees, there were ripened upwards of a thousand dozen of fruit (at a small estimate), and there has not been less in any year since the present mode of netting was used. In the present year there is quite as good a crop, and the trees are perfectly clean and healthy. The fruit underwent its first thinning in the beginning of June, when, of full sized young fruit, besides many not so large, there were taken off 300 dozen Nectarines, and 954 dozen Peaches; and a further thinning will be requisite after stoning.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, for the week ending Oct. 26, 1854, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 29th and 30th, 1833—therm. 67 deg.; and the lowest on the 3d, 1845—therm. 20 deg.

Notices to Correspondents.

AMARYLLIS: *G B E.* If you do not wish to have your Amaryllises in flower early, you cannot do better than leave them undisturbed and dry till spring, when they should be "shaken out," repotted in fresh loamy soil, and placed in bottom-heat in a pit or bark bed. When their flowers are nearly expanded they may be removed to the greenhouse or conservatory.‡

APPLES: *Tyro.* The Ingestrie Pippin does not deserve a wall; better substitute the Ribston Pippin, and, if you have space, the Scarlet Nonpareil and Boston Russet may be added to the others you propose.‖

BOOKS: *Donton.* M'Intosh's "Book of the Garden."—*G M. and Co.* Sowerby's "English Botany," in about 40 volumes 8vo.

BRUSSELS SPROUTS: *Sub.* Your mode of culture is correct. The small green heads like little Cabbages that are formed on the stem, are what are used. They are peculiarly rich and sweet, and are stripped off all through the winter as they are wanted. When they are done the plants are of no further use.‡

GOURDS: *H L.* The sort to which you refer was, we presume, the Great Spanish Potiron, or some similar variety; it frequently weighs more than 100 lbs. No such sort is known as "the "Saccharine Pumpkin." The seed of the Spanish Potiron can be had of any of the great London seedsmen.

GREENHOUSE: *H T.* Your letter has been forwarded to Messrs. Gray and Ormson.‡

HOLLIES: *B B.* There is no Holly which bears a white berry; what is called the white-berried Holly has yellow fruit. We never recommend dealers.‡

INSECTS: *T P.* The fly which has attacked your Grapes is the common blue-bottle fly, which does so every year. You may prevent it by bagging the Grapes, or covering them with a sheet of gauze. *W.*

MATERIALS FOR PAPER: *J N.* We have nothing to do with the advertisement of 1000*l.* reward; but we believe it to proceed from persons of the highest respectability. One of your specimens of home-made paper is worthless, on account of its rottenness, as well as bad colour; the other is strong and good, but very coarse, and not white enough for printing purposes. The fibre itself, if it can be bleached easily, seems well suited for paper-making, but it is too weak to be taken on a sheet.‡

MONEY INVESTMENT. If a *Young Gardener* goes to the nearest country banker, he will find no difficulty in having his 100*l.* invested in the funds, or placed at interest in some bank of deposit, the credit of which is unquestionable. This transaction may be effected any day, and at once.

NAMES OF FRUITS: *Const. Reader.* 1, Wormsley Pippin; 2, Norfolk Beefin; 3, Court of Wick; 4, Beurré Diel; 5, Passe Colmar; 6, Beauty of Kent; 7, 8, Brown Beurré; 9, Beurré Rance.—*P Y C.* 1, Bishop's Thumb; 2, Easter Beurré; 3, Swan's Egg; 4, 8, Passe Colmar; 5, Catillac; 6, Duchesse d'Angoulême; 10, Marie Louise; 11, Uvedale's St. Germain; 12, Napoleon; 13, 17, 20, 24, 26, Beurré Diel; 14, Beurré Rance; 16, Doyenné Gris; 18, Louise Bonne (of Jersey); 19, Chaumontel; 22, Beurré Rance; 23, Flemish Beauty; 27, Seckel.‖

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* 1043, Ulmus montana; 1042, U. campestris, or some state of U. pumila.—*Topsy.* Ipomopsis elegans, a plant from the southern United States, and little better than an annual; it is a Polemoniaceous plant, very near Gilia.—*E D B.* We believe the fragment belongs to some Enhydra; but among 10,000 species, of which the very difficult order of Composites consists, it is no easy matter to determine a plant, even when complete in all its parts, in good condition and in fruit. We know of no such plant as Œnothera rigida.—*L W H.* 1, Orobus lathyroides; 2, Colutea arborescens; 3, Asclepias curassavica.—*Stephen Perry.* 1, Aster amellus; 2, A. pendulus; 3, A. parviflorus; 4, Galatella punctata.—*Erzeroum* 1047. Rhamnus frangula.—*J A.* One is Cattleya luteola; the other, of which you send a single flower, is Cœlogyne fuscescens.—*J R M.*—If you will refer to our Number for October 14, p. 664, you will find your plant named under the signature "Devonian." If that was not the name assumed by you, then your enquiry never reached us.

PEACH TREES: *P S.* They appear to be literally overrun with scale. You had better wait till the leaves begin to ripen, and then strip them off and *burn them*, which will prevent the insects dropping about the trees. When the leaves are off wash the trees well with water, heated to the temperature of between 150° and 160°. That will have the effect of destroying the scale without injuring the trees.‡

PEARS: *R Smith.* Your seedling Pear—small, obovate, with a wide, open, shallow eye and small stalk; skin brownish, flesh yellowish, buttery, and melting, with a rich, honied, somewhat perfumed flavour, is worthy of cultivation.‖

ROSE CUTTINGS: *A Lady.* As they are hardy sorts, we would advise you to winter them where they are, and if you have a spare hand-glass to put over them all the better; you must, however, take care that they have plenty of air at all times when the weather is fine. They may be taken up and potted in spring, and placed in a cold frame for a time, in order to encourage them to make roots and get established in their pots.‡

SPRING PROTECTION: *Zeta.* Fine netting used in the way you mention will, we fear, be of little service. Had you not better try the plan adopted by Mr. Rivers, and described in our vol. for 1849, p. 133.‡

WHEAT: *H R.* There is no question about the exactness of Fabre's statements. We do not believe the tales about Wheat, Barley, and Rye on the same stalk; they are most certainly either mere invention or cases of imposition insufficiently inquired into. Anacharis alsinastrum came to us from the River St. Lawrence; it is supposed with Canadian timber. It is very dangerous in tranquil streams. If the seeds you ask about are procurable at all, you can hear of them through any of the great English nurserymen.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6l. per ton, free to Railway.
They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.
Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.
It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

THE FOLLOWING ARE COPIES OF TESTIMONIALS IN FAVOUR OF JACKSON'S PREPARATION FOR PRESERVING POTATOES, SEEDS, &c.

"Belmont Farm, Eltham, Kent, August 28th, 1854.
"Sir,—I am now about to perform my promise, to let you know how your prepared Potatoes have turned out here. As a practical farmer of some experience I had despaired of finding any remedy for the disease; but I must confess that a stronger not have presented itself than I have now to relate. One of the fields of this farm, the property of Mrs. Stanbury, was planted with Regent's Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the smut. Any person may see the difference of the prepared and unprepared Potatoes at a glance. You are at liberty to make any use you please of this letter, and I remain, Sir, your obedient Servant,
"G. B. BAXTER.
"To Mr. Jackson, 18, Cannon Street, London Bridge."

"Sir,—I am very much pleased with the result of the experiments I have made with your prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease and in a very fine condition; while those of the same sort unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms. The Potatoes from the Prepared Seed were so remarkably good, that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others,—or about 25 per cent. in favour of your preparation. I need not say that this is quite satisfactory to me, and it is of so much importance to the public, that it ought to be generally known.—I am, Sir, your obedient Servant,
"T. AUSTIN, Nurseryman and Seedsman, Blackheath, Kent.
"To Mr. Jackson, 18, Cannon Street, London Bridge."

"Hythe End Farm, Wraysbury, Staines, Sept. 5, 1854.
"Sir,—I have very great pleasure in informing you of the result of the experiment made with your Patent Preparation, for preserving Potatoes from disease. I am not yet able to give you a report of the whole crop, as I planted very late in the season, and the Potatoes are still growing; but so far as I have ascertained the result fully bears out the statement made by you, as to the complete efficiency of your process in preventing disease. I had the prepared and unprepared planted in adjoining plots, among the unprepared I find the disease in the same form it has assumed during the past few years, while in the plot adjoining, and which were prepared by you, there is not to be found the slightest appearance of disease.—I am, &c., THOMAS BUCKLAND.
"To Mr. Jackson, 18, Cannon Street, London Bridge."

"Stone Grove, Edgeware, 15th Sept., 1854.
"Sir,—You will be glad to hear that your prepared sets of Potatoes have turned out very well here, both as to quantity and quality, while those in the adjoining ground, which were planted with unprepared sets, have the disease as badly as ever. The agriculturists are much indebted to you for discovering so valuable a remedy for the Potato blight, Mr. Wylde is as perfectly satisfied as I am with the success of your patent for preserving the Potatoes from the disease; and there is no doubt the same preparation would preserve Wheat from the Smut, and every description of corn and vegetable from the blight to which they are subject.—I am, THOMAS PRIEST, Bailiff to H. Wylde, Esq.
"To Mr. Jackson, 18, Cannon Street, London Bridge."

"To Admiral Sir JAMES A. GORDON, K.C.B., Marlee House, near Blairgowrie.
"Sir,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. Jackson, were planted in a piece of new ground; and according to the directions sent by him along with them as to distance between the plants, &c. They came up well; the tops showed some appearance of disease about the middle of August. I have dug up a few stems to see the state of the Potatoes, and there is not the slightest appearance of any disease; they are very large and very prolific; they are quite ripe, fit for taking up. There were long black Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased.—I am, Sir, your most obedient Servant, (Signed) JOHN SHANKS.
"Kildrummy Castle, Aberdeenshire, 25th Sept., 1854."

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

SAMUELSON'S PATENT PRIZE FORKING MACHINE (Silver Medal from the Royal Agricultural Society of England, Prize from the Yorkshire Agricultural Society, Prize from the Cleveland Agricultural Society, and Prize from the Worcestershire Agricultural Society) is now proved by experience to be an invaluable implement for deep tillage, and equally effective as an extractor of Couch Grass and other Weeds, in testimony of which, numerous reports from farmers using it in every part of the kingdom may be had on application. Various imitations have failed, through the absence of its essential feature—the Patent Fork. The amount of horse power is less in proportion to the surface deeply pulverised than that required in the ordinary shallow ploughing. The application of steam power to tillage is still a problem to be solved, and it is not necessary to defer deep cultivation until its solution be accomplished.

SAMUELSON'S IMPROVED GARDNERS' TURNIP CUTTER (Prize for the ninth time, at the Royal Agricultural Society's Meeting, Lincoln, 1854). The improvement is a rasping plate for loosening and voiding dirt from the roots, whilst being cut, whereby the scouring tendency of root feeding is diminished.
B. SAMUELSON (Successor to late Mr. Gardner), Britannia Works, Banbury.

LAND DRAINAGE.
MR. JOHNSON begs to inform Landowners, Agents, &c., that he is prepared to undertake the Drainage of any description of Land, either by contract, or by a small charge per acre for planning and setting out the drains, taking levels, and superintending the work. Numerous satisfactory references can be given by Mr. J., who has been for several years in constant practice as a Draining Engineer.—Address 12, Abingdon Street, Westminster.

THE BIRMINGHAM POULTRY SHOW, 1854.
The SIXTH GREAT ANNUAL EXHIBITION OF DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of December next. Copies of the Prize Lists and Certificates of entry may be had on application to the Secretary.
In addition to the prizes announced in the list dated the 23d have resolved to offer First Prizes of 2l., and Second Prizes of 1l., for Single Cock Birds of any age, of all the following varieties, viz.: Dorking, Spanish, Cochin China, Bramah Pootra, Pencilled Hamburgh, Spangled Hamburgh, Game, and Polish; and that the same shall be entered under Letters A to H on the ordinary certificates, and exhibited separately.
Seven Silver Vases, of the value of six guineas each, will also be awarded, instead of money prizes, for the best pen of Pencilled Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, and Game Fowls.
First, Second, and Third Prizes of 3l., 2l., and 1l. respectively, are offered in all the Classes for Fowls, as well as for Turkeys, Ducks, and Geese. Liberal Prizes will also be awarded to good specimens shown by Cottagers, whose entries must be made on a form of certificate different from that used for the general classes.
The ENTRIES CLOSE on SATURDAY, the 11th of November.
JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham, Oct. 28, 1854.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of December next. The PRIZE LISTS and Certificates of Entry may be obtained on application to the Secretary. The Entries close on Saturday, November 11. JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham.

SUSSEX, KENT, AND SURREY POULTRY EXHIBITION.—The ANNUAL SHOW of the REIGATE POULTRY SOCIETY, open to the above three Counties, will be held at the PAVILION, BRIGHTON, on the 21st, 22d, and 23d of November.—For particulars apply to Mr. JAMES FISHER, Reigate, Mr. GEORGE K. KING, 155, North Street, Brighton, E. N. HARPER, Esq., Reigate, and CHARLES HART, Esq., Dorking, Honorary Secretaries.

SMITHFIELD CLUB, 1854.
CHRISTMAS FAT CATTLE SHOW.—The Annual Show of Fat Cattle, Sheep, and Pigs, will take place on the 5th, 6th, 7th, and 8th of December, 1854, at the Carriage Bazaar, King Street, Portman Square, London.
All Certificates must be returned to the Honorary Secretary on or before SATURDAY, the 4th November, 1854.
Prize Sheets, and the necessary Printed Forms of Certificates, are now ready, and can be obtained on application to
B. T. BRANDRETH GIBBS, Hon. Sec.
Corner of Half-Moon Street, Piccadilly, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 28, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, Nov. 2—Agricultural Imp. Society of Ireland.

WE have no wish to continue a discussion which is made a personal rather than an agricultural affair. The professional interests of our readers are, if not more important in themselves, at least more interesting to us than either the truthfulness of individuals or the trustworthiness of *journals*—which appear to be all that the *Mark Lane Express* can see involved in the differences between us: and to the way in which the evidence given in our last two Numbers affects these we shall at once confine ourselves. Let us, however, add, in reference to the latest remarks of our contemporary on this subject—on which, according to their own confession, certainly no "over refinement" has been wasted,—that we are very willing to accept the division of agricultural intelligence which he proposes;* and while all the safe and stale, the well-known old-fashioned information goes to him, let all the *extra*-ordinary events of the day, the evidence of progress and "news" of real agricultural advancement come to the *Agricultural Gazette*. We have no wish for correspondents who are carried forward against their will and with their eyes and minds the other way. We can strike our agricultural averages without their assistance, and need no one to tell us how low they are, whatever be the department of farm practice to which they refer. It is the history of experiences, showing how these averages may be raised, that we desire; and we hope that all who have any such experience to relate will take the hint given in the foot-note below, and learn from it where they are most likely to meet with sympathy and thanks.

It is to the account of such an experience that we now beg the attention of our readers. We will avoid all reference to hearsay evidence and reports of unpremeditated speeches, and confine ourselves to the documents before us. We have first the letter of Mr. KENNEDY, of Myremill, to Mr. MECHI, and read by that gentleman in the Clover field at Tiptree, saying that he had, during the last month, kept on 33 Scotch acres of Italian Rye-grass "250 large cattle, 465 sheep, 200 pigs, and 25 cart horses." Then there is the letter of Mr. TELFER, of Cumming Park, in which he states that his cuttings of Italian Rye-grass will this year "much exceed" 65 tons per acre. In the third place we have a letter from Mr. DICKENSON giving his equally extraordinary experience on the subject, stating among other things that four horses, receiving nothing else, cleared only 38 square yards of this same crop per day. And lastly we have a letter from a known correspondent in the county of Ayr, saying that 50 cows could not consume 7 Scotch acres of Italian Rye-grass at Myremill, and that 70 sheep per acre are kept there on that crop.

The witnesses are men of character, and their evidence, though coming from so many quarters, is wonderfully consistent. Our Ayrshire correspondent, writing with the facts under his eye, speaks of the "pig-headed" incredulity with which the account is received. We have not the facts themselves before us, nor have we anything in our own experience at all to compare with them; but we must be entirely deaf to the force of testimony, and blind to the laws by which its value is determined, if, on receiving genuine documents, attested by four good witnesses in three different localities, and describing these facts—which, however different they may be from anything yet known, are at least consistent among themselves—we should join in the thoughtless laughter with which such testimony has been received. And we have no hesitation whatever in adding that the agricultural journalist who can receive such intelligence as this, and find nothing in it but an opportunity to pick holes in the public and professional character of a political opponent, either wonderfully degrades that position as an "agricultural leader," which Mr. BEALE BROWNE accords him, or *does not hold it*.

It matters very little whether any of this Italian Rye-grass was made into hay, or how much hay it made. We know of but one instance where so much as 9 tons of Clover hay has been made off 3 acres of ground, and then it was not made *on* the extent from which it was cut. Whether either Mr. TELFER or Mr. KENNEDY may have tested the hay-producing capabilities of their crops and of their climate, we cannot now declare, since the statement on that point which we heard at Tiptree has been denied. Those who are curious on the possibilities of this subject will find the fullest account of the relations between Grass and hay in Dr. THOMSON'S little book on the "Food of Animals" (Longman). The main point, as we have said, is the enormous yield of green food which, under proper culture, Italian Rye-grass will produce per acre—the enormous quantity of stock which it will maintain. Mr. KENNEDY'S statement, putting one horse as equal in its power of consumption to eight, and one of the "large cattle" to six sheep or pigs, amounts to this—that 72 sheep per acre had been kept during that month—that is, we suppose, on one cutting of Italian Rye-grass. A sheep of ordinary size will eat at least 7 cwt. of green food out of doors in a month; and here, then, is a produce of 25 tons of green food per acre at one cutting! Wonderfully consistent with the statement made by Mr. TELFER. In Mr. DICKENSON'S case, while the four

* "Whenever a sailor attempts to spin his messmates rather too tough a yarn, he is politely requested to 'tell that to the marines.' For the future, whenever we hear anything overmarvellous about agriculture, we may save ourselves a deal of trouble by requesting they will 'tell *that* to the *Gardeners' Chronicle!*'"—*Mark Lane Express, Oct.* 23, *p.* 8.

horses clearing only 38 square yards of Sainfoin in a day is even a more extraordinary statement, his further account of 5 acres keeping "70 to 100 horses in rackmeat during the spring and summer months—some of them eating four feeds of Oats per day, and some no Oats at all," will be found very fairly to corroborate the Scottish statement.

What, then, is the use to be made of the facts—for such we must believe them to be—which are thus alleged? Shall we urge every one at once to commence laying down subterranean systems of pipes in connection with tanks and force-pumps? This is neither possible nor desirable. The "agriculturist," on whose testimony our contemporary relies, is no sounder in his logic than he is in his geography, when he would insinuate Mr. Caird's untrustworthiness as an agricultural teacher, because, with all his commendations of his "*neighbour*," Mr. Telfer, he had himself done nothing in imitation of him. We do not know whether he has or not: it is not such details as this, nor is it to the pages of "High-farming Harrowed,"* that any reasonable person will look for the real agricultural status of a public man. We cannot all be mounted targets with feathers in our caps, but more than one well-contested field has proved the usefulness of such leaders. And all that we desire to do at present is to assert the real position of these men as our leaders, assured that if that be generally acknowledged, the ordinary rank and file of the agricultural array will gradually advance upon their steps, so that the strongest positions which prejudice at present holds, however recklessly defended, must yield at length.

There are contrasts in all ranks: among landlords or among farmers. And there is no wider interval in point of agricultural practice between Mr. Kennedy, of Myremill, with his 70 tons of Rye-grass per acre, and many a cultivator who is satisfied with seven—than there is in point of agricultural sentiment between Colonel McDougall, of Logan, whose address we gave last week, and Mr. Colvile, M.P., who lately spoke at a meeting of the Sparkenhoe Farmers' Club, in Derbyshire. The former congratulates his tenantry, and prides himself upon their success and their high standing in the agricultural world. He refers to his own farm practice, and the satisfaction with which he could so largely embark in it, seeing that his expenditure was not only beneficial to others, but justifiable, because profitable, in itself. He takes his position in the assemblage as one amongst friends with whom he could enjoy intercourse on equal terms. And his friends—his tenantry—were well represented in the reply to their landlord's speech. Mr. McLean congratulates the gallant Colonel on his return to his estates; acknowledges with pride and satisfaction the vast improvements which have been made upon the property; speaks fearlessly of the scanty use which alone is justifiable of the word "impossibility" in agriculture; refers gratefully to the exertions of Mr. Caird, of Baldoon, to procure the cheapening of guano; and concludes with a picture of the contrast between the prosperous condition of the Logan estates and that of others where the vaunted liberality of landlords in doling out a return of so much per cent. of rents to their tenantry was but an indication that the last penny had already been so completely screwed out of the farmer that he had no margin for casualties. "On the Logan estates these paltry deductions, thanks to the enlightened policy of the respected landlord, were not wanted. The system there was—live and let live."

Now for the contrast to all this:—At the meeting the other day at Ashby-de-la-Zouch, Mr. Colvile gets up and expresses the opinion that farmers' wives are too proud for their work—that if they would have good dairies they would have little time to play the piano—and so forth! Of course there was not a farm-tenant in the room who did not feel it all to be simply gratuitous impertinence, and "a perfect tornado of indignation, hisses, groans, and cries of down—down," very properly arose; until the speaker, having at length concluded his remarks, was answered by Mr. Campion, amid the overwhelming applause of the meeting. And we are sure that there is not a tenant farmer out of doors who has read the account of this meeting, who does not feel that with landowners so ill-advised as Mr. Colvile in this instance proved himself to be, the payment of rent might very well be considered, not merely as the entire cancelling of obligation, but as the only occasion for intercourse between landlord and tenant.

We commend the opinions of our friend and correspondent "J. W.," of Peterborough, given in another column, to all who think that, as landlords, they have any business to interfere in the family arrangements or recreations of a rent-paying tenant. And we imagine that the more intelligent among them will agree with us that, even in the case of tenantry whose means but reach from hand to mouth, improvement will more probably be derived from encouragement given in the field, than from prying into what goes on at the fireside.

* A sarcastic criticism of Mr. Caird's celebrated pamphlet, published in Blackwood's Magazine, 1850; of course, as clever and unfair as on such a subject in such a periodical it was likely to be.

NOTES ON EXPERIMENTS IN THE GARDEN OF THE ROYAL AGRICULTURAL COLLEGE.

By Professor James Buckman.—No. VII.

(*Continued from p.* 620.)

6. *Avena fatua* (Wild Oat).—This is a Grass belonging to the true Oats, and not to the Trisetum forms. It grows as tall, if not taller, than the cultivated varieties of Oat; but is readily distinguished from them by an abundance of stiff hairs attached to the base of the corolla glumes; however, in this respect, it is approached by occasional starved or seeded specimens of the field Oat, in which hairs are not unfrequent on the corolla—a circumstance which gives some countenance to the belief so general among the farmers of the heavy lias clays in the Vale of Gloucester, namely, that it is unsafe for them to cultivate Oats, because they leave behind a degenerate race of wild Oats. However, be this as it may, it will be found to be a most troublesome weed, especially on stiff sterile lands, where it most commonly makes head among the Wheat and Beans, when, from the similarity of its growth to Wheat, it cannot readily be distinguished, and, consequently, much is left behind after hoeing; it, however, mostly overtops the Wheat—thus, by its large flags, and more vigorous growth, keeping away light and air from the desired crop; and as its seeds ripen before the crop, their self-sowing ensures a continuance of the evil. The best method of getting rid of the pest would appear to be careful weeding with crops of Turnips and Beans; indeed so much of it would not be seen annually in the soil indicated, only that it is held as unfit for Turnip cultivation on the one hand, whilst on the other, the poor farmers on stiff intractable land seldom care enough for the weeding of Beans, which, without so doing, become a more prolific nursery for every species of weed than is presented in any other crop; this we hold, in any soil, to be a shortsighted policy, as nothing can be more prejudicial to a Bean crop than a rank undergrowth of weeds, many of which, as the Convolvulus arvensis, Polygonum Convolvulus, Ervum hirsutum, Galium aparine, and the like, twine and entwine themselves with the stems and foliage of the crop, as totally to prevent its growing; besides such a host of company can only be maintained at the price of its well-being, and ultimately at the farmer's cost, so much so indeed that any farmer will find that it is much cheaper to be hospitable to friends than indulgent to weeds. With Beans, too, a rank growth of weeds would appear, if not to cause, at least to aid the extension of the Puccinia fabæ, a fungus disease, to which they are exceedingly liable, and which is highly prejudicial to the crop. In concluding my notes upon this Grass, it may be well to remark that my plot of this year is from seed that had been cultivated in the garden the previous year, and there is a perceptible difference in the size of the grain.

7, 8. *Arrhenatherum avenaceum* (Oat-like Grass).—Little need be noted upon this Grass, only that it grows a large quantity of herbage, equally on poor clays or light sands; for the latter position it seems to be fitted by a tendency to increase the size of the underground nodes, giving the lower part of the plant the appearance of strings of small Onions. This is the variety called A. bulbosum (Onion couch), which is such a pest on such lands as are frequently to be met with in some parts of Worcestershire, which is mostly made up of the disintegrated slabs of new red sandstone, or again at Cheltenham, where are thick beds of ancient marine sands filling up hollows in the lias. In the latter, which is much used as garden ground, for which it is peculiarly adapted, the Onion couch has to be picked out in digging, with great care, otherwise the evil is continued, as the smallest portions left behind will grow with great rapidity. As a pasture Grass, though the yield is great of both varieties, it must take but a low place, as cattle of all kinds seem to have a disrelish for it, which is perhaps accounted for by its exceedingly bitter and disagreeable flavour.

9. *Holcus lanatus* (Soft Grass).—Is a Grass of little consequence, as when abundant in a pasture it is an evidence of poverty of soil; it is universally refused by cattle, and hence, from the quantity of light-coloured flowers that may be seen of it in sterile pastures in the months of August, September, and October, it has received in some counties the name of "Fog." This species is usually mistaken for H. mollis, to which specific name its greater softness would seem to entitle it; the H. mollis, however, of Linnæus is much less hairy in all its parts.

10. *Dactylis glomerata* (Cocksfoot Grass).—My example of this Grass was planted in drills of about 6 inches apart, in which position it soon attained to a vigorous state of growth, each root however increasing greatly in size and the amount of its herbage year by year. It is a highly-valuable Grass, and may be cultivated in almost any soil; it bears cutting well, and rapidly shoots up a quantity of sweet herbage of nearly twice the height, in a given time, of the surrounding species; and its appreciation by cattle may at once be seen by whoever will observe what takes place when they are turned to depasture upon the lattermath, as the tufts of Cocksfoot will be the first to engage their attention. The culms, however, are large and coarse on which account it does not make the finest hay; at the same time the quantity of its yield, and its well-known nutritive properties (as shown not only by observation, but from chemical analysis), should give this Grass a high place in the esteem of the agriculturist. If we compare the result of the analysis of this Grass with those of two other species, well known for their value as pasture Grasses, we shall see not only that it does not suffer in the comparison, but it will afford us good evidence of the value of chemistry in inquiries connected with the value of Grasses:—

Analysis of three Good Grasses, by Professor T. Way.

In 100 parts of the Grass, dried at 212° Fahr.	Albuminous, or flesh-forming principles.	Fatty Matters.	Heat-producing principles Starch, Gum, Sugar, &c.	Woody Fibre.	Mineral Matter, or Ash.
Alopecurus pratensis (Meadow Fox-tail)	12·32	2·92	43·12	33·83	7·81
Lolium perenne (Perennial Rye-grass)	11·85	3·17	42·24	35·20	7·54
Dactylis glomerata (Cock's-foot Grass)	13·53	3·14	44·32	33·70	5·31

That the Dactylis glomerata is capable of growing a large crop my experiments fully prove, not only of culms but of aftermath; the culms, however, are somewhat coarse, but with their nutritive qualities must be valuable, especially in chaff. I am not aware of its having been tried as a self-crop, but there can be but little doubt that if examples be so tried different from those generally employed, this Grass has much to recommend it.

11. *Poa pratensis* (Meadow Grass).—This Grass, though it by no means yields the crops of the preceding, is still one of great importance, especially in natural pastures, as by its slightly creeping habit it tends to the keeping up that matted form of growth, without which turf must always be inferior; this circumstance added also to the fineness of its leafage renders it one of the most valuable species for lawns, but though this latter property does not add to its value in aftermath, yet its fine culms and its property of well doing in almost any soil, must give smooth meadow Grass a high character as a valuable adjunct to the hay field.

a general rule may be considered as inferior to the P. pratensis, a fact which is also confirmed by analysis. 100 parts of each of these dried at 212° giving to Professor Way the following results:—

	Poa pratensis.	Poa trivialis.
Albuminous or flesh-forcing principles	10·35	9·80
Fatty matters	2·63	3·67
Heat-producing principles—Starch, Gum, and Sugar	43·06	40·17
Woody fibre	38·02	38·03
Mineral matter or ash	5·94	8·33

At the same time, we must bear in mind that the former is better adapted for uplands or dry soils, the latter for lowlands; indeed a large quantity of it in other than irrigated meadows will at all times be a good indication of want of drainage. In irrigated meadows, especially those that have not been a long time in operation, the P. trivialis forms a great part of the bulk of the pasture, in which it is said to yield far larger proportionals, especially of fat-forming principles, than is usually the case; but even here if the plans have been in complete operation for a few years, and the drainage tolerably perfect, it gives way before the Lolium perenne, Poa pratensis, and others usually of better quality.

13. *Poa nemoralis* (Wood Meadow Grass).—Of this species few trials have been made, probably from the fact that its wild habitat in woods, and on the glacis of limestone rocks, would promise but a poor result; but unpromising as it might appear, this Grass nevertheless grows well in open situations, yielding a quantity of delicate herbage; its culms, however, growing later than most other species, usually appearing in the lattermath, on which account this might possibly become a valuable Grass, where second crops are obtained (a vicious practice, by the way, by no means commendable), its tender culms in late depasturing are by no means objected to by cattle; but it may be much doubted whether the smallness of its yield does not render it of little value as a pasture species. *Cirencester, Oct. 3.*

(*To be continued.*)

GLOUCESTER CHEESE-MAKING.

[The following is taken from the published report in the *North British Agriculturist* of a deputation from Ayrshire, which lately visited the dairy districts of the south of England.]

Few if any of the Gloucester cheese are what we would call *full-milk* cheese. It is a common practice in the vale of Berkeley to take the cream from a considerable proportion of the milk. In the dairy at Water End very little cream is taken off; and this, together with the general carefulness of the management, accounts for the superiority of Mr. Leonard's cheese. He has 36 cows this summer; and previous to our visit 8 lbs. to 9 lbs. of milk butter, in addition to the cheese, were weekly made. As cheese is made twice a day, the hours for milking are early. In the morning it is commenced a little before 5 o'clock, and in the afternoon at 3. As the milk is brought in it is put into the cheese tub,

and great care is taken to free it from impurities. A cloth is thrown over the tub, and above it is placed the ladder with the hair sieve through which the milk is poured. A table spoonful of nitre is put over the cloth, and is left to mix with the milk as it flows through into the tub. The colouring matter, composed of a solution of annatto, and the rennet are then added, and stirred carefully through the milk.

The thermometer is not used in Mr. Leonard's dairy, and on that account we cannot speak precisely as to temperature. During the time of milking there is, of course, a considerable loss of heat; and as the small quantity of skimmed milk is added in summer without being heated, the temperature of the whole, we would suppose, may be from 85 to 90 degrees when the rennet is added.

About an hour is allowed for coagulation. The time for breaking is judged by the touch of the finger. By allowing the curd to become pretty firm the whey comes off purer than it would do if the curd were earlier broken. Breaking the curd is an operation that must be carefully performed. The dairy superintendent, or in her absence a trustworthy person, must do this part of the work. The hands are put gradually down to the bottom of the tub, and are brought slowly to the surface with the palm upwards, and the fingers extended. This is done repeatedly; and care is taken to avoid pressing or squeezing the curd, as a very slight pressure would cause the whey to come off white. After the hands have been passed through the whole mass in this manner, a circular wooden breaker, formed like a net, is used to complete the operation of breaking. It is moved slowly and steadily until the whole of the curd is made very fine. The breaking usually occupies from 20 to 30 minutes. The curd is then left about 20 minutes, to allow it to settle to the bottom of the tub. It is next drawn gently by the hands to one side of the tub to admit of the whey being taken from the other side. The whey is lifted in a wooden bowl, and poured through a hair sieve into the leaden vessels, which are placed at the side of the dairy. The sieve retains any small portions of the curd that have been lifted in the bowl. When the greater part of the whey has been taken off, the curd is heaped on one side of the tub; it is cut in different directions, to allow the remaining whey to run out, and is gently pressed by the hands to accelerate the separation. The whey, as it flows from the curd, is lifted from time to time and put through the sieve into the whey leads. The curd is then put into vats with thin cheese-cloths, locally called whey-cloths, over them; and the vats are placed in the press, one above the other, for about 20 minutes.

When taken from the press, the curd is cut into squares, and broken by the hand somewhat finely into the tub. A little heated whey is poured over it; the whey and the curd are well stirred together; the curd is drawn slowly to one side of the tub, and the whey is taken out as before.* After the whey has been taken off, the curd is again broken down by the hands into the vats. It is easily broken, as it has not attained a firm state of cohesion. As the vats are filled, the curd is pressed into them with the hand, and they are piled one above the other in the cheese-tub. At this stage the curd is in a pasty state, and the fragments combine very easily; the pressure from the weight of the vats brings the contents of each vat into a mass. When the vats are all filled, they are reversed, and the bottom ones placed uppermost. The top cheese is taken and a triangular paring, about an inch broad at the base, is cut off round the edge. It is then turned into a whey cloth, the vat is rinsed with a little whey, and the cheese is put into it with the cloth under. The edge that is now uppermost is pared round as the other had been, and a portion of curd, in the form of an inverted cone, is cut out of the centre of the cheese. This is called "cutting out the witch," and we have been informed that the practice is seldom omitted by a Berkeley dairymaid. Along with an old horse-shoe over the door it forms a perfectly sufficient safeguard against witchcraft. The "witch" is broken down by the hand, the paring from the edge is placed round the opening made by "cutting out the witch;" as much more curd is put in as suffices to make the vat full enough; the cheese is covered over with the cloth, and is put into the press. The other vats are treated in the same manner, and are then put into the press.

After being pressed an hour or an hour and a half, the cheeses are put into dry whey-cloths, and returned to the press till the evening. They are then rubbed over with refined salt, and put into thicker cloths, called "salting cloths." In the morning the cheese is again rubbed with salt, and returned to the press in the same cloth. Next morning it is rubbed a third time with salt, and the salting-cloth is put over it another day. On the fourth morning the cheese is put into the vat without a cloth, for the purpose of being made smooth. It is reversed in the vat on the fifth morning, and again on the sixth, and on the seventh morning it is laid on the shelf. The frequent rubbing of so many cheese with salt has a very severe effect upon the hands of the dairymaid.

It may be stated as a fair average of the amount of whey butter in Mr. Leonard's dairy, that one pound is made weekly from the produce of each cow during summer. The cheeses are turned daily in the cheese room until they become firm, and afterwards they are turned about twice a week. Before being sold they are painted with colouring matter composed of Venetian red and water. There is no particular age of the cheese at which the painting should take place. They are painted just long enough before being sold to allow the peculiar bluish colour, which indicates a true Gloucester cheese, to show itself. This may be at the age of three or four or six months. In painting, the dairymaid sits on a low stool, takes the cheese in her lap and scrapes it carefully. She then stains it over with a woollen cloth dipped in the paint. In some cheese-rooms, after the cheese is painted, a Cabbage-leaf is placed upon it, to assist in imparting the desired colour. The leaf is kept on a week, first on the one side and then on the other. A longer time of it would injure the colour.

The single Gloucester cheese, which is generally made in Berkeley, is 15½ inches in diameter, and from 2¼ to 2½ inches in depth. This gives about eight cheeses to the cwt. The quality of the double Gloucester is originally the same, but it is made of double thickness, and is usually kept to a greater age, which accounts for the higher price at which it is sold. The large leaden vessels and some of the other utensils in the Berkeley dairies are excellent. The cheese-tubs, like most of our own, are of wood; but the vats or chessels are much superior to ours. They are made of Elm, and are turned out of a single piece of wood. Their surface is remarkably smooth; and as they are hooped with wood there is nothing about them to corrode. With ordinary care, therefore, they last a long time. The wooden presses, though they have a clumsy and old-fashioned appearance, seem to work well. We counted 15 cheeses piled upon each other in one of them. They have no advantage over good lever presses, and in some respects are not so convenient.

THE PRODUCTIVENESS OF CORN CROPS.

The reply of a friend of Mr. Smith's to an exposition of his plan was, "I would rather have my 6 quarters than your 4 quarters and 2 bushels;" and he was right, if he could ensure, with equal certainty, his 6 quarters with intermediate crops as remunerative as Mr. Smith's 4 quarters and 2 bushels; 6 quarters, however, are rather the exception than the rule of our present systems, yet I see not, under Mr. Smith's indications, with some modification of his plan, but that 6 quarters may become the rule. To confirm this rule, it is true, we shall require something from science and more from experiment; and, when the bread of the people is the question, it is surely worth while to try what we can do. Mr. Smith himself, strenuously as he may enjoin a strict adherence to his directions, will, in the benevolent spirit which moves him, rejoice to find, in a departure from them, so beneficial a result.

Mr. Smith, in proper Wheat soils, depends solely on mechanical operations to give activity and efficiency to natural causes, and these are sufficient to produce, little more or less, 34 bushels to the acre. It remains to be proved, and he has not tried it, whether by using some artificial aids, these 34 bushels may not be brought up to 48 bushels. Even in the best constituted Wheat soils there exists a very great difference between their component parts and the composition of the Wheat plant at all periods of its growth; we cannot doubt that this must militate against the perfect development of the plant. It is impossible that it can make that full, perfect, and rapid development which it would do were its food directly proportioned to its requirements. It must lose time in getting rid of surplus elements, and must be retarded in waiting for a sufficient supply of the deficient ones. We are here supposing the roots to possess no elective power, but to take up everything which is offered to them in a soluble state, and that it is the property of the plant internally to divide, separate, and throw off such matters as it does not assimilate. Did the roots possess this elective power still the plant would suffer from the short-coming of some of its requisite elements, for it must wait till a due proportion of each were offered to the roots to enable the work of assimilation to go on. It is not that the composition of the soil be strictly homogeneous with the Wheat plant, but that the parts of it which can be acted on so as to become soluble should be in relative proportion to their solubility and the demands of the plant. Hence it were absurd to expect any immediate effect from the application of specific manures in such quantities as the crop is supposed to remove from the soil, for it can only take up so much of them as bear a proportion to other matters in the soil in a state of solution.

It may not be possible to render a soil on a general scale so strictly proportioned to the constitution of the Wheat plant, but something may be done towards it, and possibly a sufficient extent of land might be rendered so for the production of seed. But there may be plans of tillage more within the common reach, that will bring up the produce to the proposed amount; the stimulating, by specifics, of the first growth of the plant, as, in the application of bone-dust to Turnips, there can be no doubt that much of the future growth depends on the health, strength, and perfect and full development of the first leaves and rootlets; most certainly very much depends in the vegetable, as well as in the animal, on a full and proper supply of food at the weaning time, and this, I would say, in plants, is at the period when, having consumed all the food contained in the seed, they begin to draw their future nourishment from the earth and air.

Though from the rankness of Mr. Smith's Wheat any application of manure may seem superfluous, yet, as he has never reached the extreme of productiveness, there must be a something wanting to give us the 6 quarters. It is sheer nonsense to talk of its being only half a crop, it enjoys the natural appliances of the whole acre; it is, in effect, a full crop. The fallow intervals, I am satisfied, entail no shortcoming of crop, indeed, in small experiments, I have seen the largest products at wider distances.

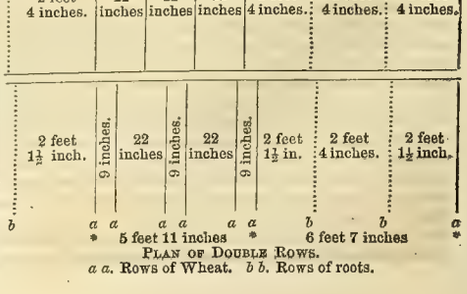
It has been proved beyond question that the alternating in rows of different families of plants, give a greater acreable produce than do their separate production. Perhaps the growing of corn in strips of land alternating with manured green or root crops, each crop being continually cultivated in the same strips, the strips being of sufficient breadth to allow for carting on manure, say 6 feet wide,* will be found a most productive plan, and is, indeed, a mere modification of Mr. Smith's plan of cultivating grain and green crops in separate fields. The advantages of this mode, that I reckon on, are, that the strips are not so wide but that the different plants in them may take up by leaf and root the matters mutually refused or discharged; and, that while the green crops receive the full benefit of all the manure of the farm continually deposited on the same ground, the corn crops are nourished by the underground currents flowing from these manured strips in the ultimate stages of decomposition, in which state manure seems to act most favourably on our cereals. This plan may be tested by the corn and green crops changing ground every alternate year, the strips this year in corn being next year in green crop.

In sowings of single seeds at regular distances of 1 foot each way, the Hardys obtain far higher returns than Mr. Smith. The Rev. Mr. Wilkins considers 2 square feet requisite for the full produce of the Mummy Wheat, and I am not sure but he holds the same space in other Wheats. His returns are also superior to Mr. Smith's; as for the Hardys, they have challenged all England—no, the United Kingdom—to produce so good a crop as theirs. All these gentlemen ascribe the superiority of their crops to arise chiefly from the very thin sowing, the isolation of their seed at such wide distances. As far as my very humble experiments enable me to ascertain, the thick or thin sowing of seed (of course, not in excess), have little effect on the produce. I rather see in this a wise dispensation of Providence, that the bread of man may not depend on, in ordinary tillage, a casual effect; the tillering of plants seems a wise provision to supply the deficiencies in thin sown spots, which may, however, be wisely turned to account in saving seed. Were Mr. Smith's seed dropped 7½ inches apart in the rows, there would be a plant for every square foot in the acre; surely 7½ inches by 12 inches in the centre rows, and 7½ inches by 2 feet in the outsides ought to give space enough for a full development. Will any one imagine this thinness of sowing will bring up his produce to 6 or 8 quarters? If so, let him try. I am an advocate for thin sowing, yet I verily believe it would not. *J. M. Goodiff, Granard.*

Home Correspondence.

Moral and Intellectual Improvement in Rural Districts.—Country villages should have each a resident clergyman, whose co-operation would be very desirable if he did not attempt to control too much the inclinations of the members of such associations as might be formed for the purpose of mutual improvement; one or more intelligent farmers might also be requested to give aid by their counsel as well as by their subscriptions; farmers' sons might be tempted to join as well as the village schoolmaster, land surveyor, parish clerk, baker, grocer, butcher, smith, shoemaker, or tailor. From such persons might be chosen a chairman and a secretary, with, perchance, a librarian or even a lecturer. The size of the village would in some measure determine the

* I look upon 12 feet 6 inches as being a convenient breadth for the double strips of corn and root crop; this will allow of four rows of corn at 22 inches apart, occupying a breadth of 5 feet 6 inches, leaving intervals for green cropping of 7 feet, which will admit of two drills at 2 feet 4 inches apart. From the upright growth of the corn, I consider 22 inches will give as free working room as 2 feet 4 inches will for the more spreading green crop. As the green cropped intervals will not, on this plan, be convertible into corn strips, it is necessary that these latter should constitute a fallow in themselves. It may be found more productive, and it will certainly meet more the general view, to have three double rows of Wheat instead of four single ones; by adding 5 inches to the strips of 5 feet 6 inches, sufficient breadth will be afforded for the same working spaces of 22 inches between the double rows, and allow them to stand 9 inches apart, and the row reduced intervals of 6 feet 7 inches will give equally proportioned working room for the green crop, for while it will allow the 2 feet 4 inches for the centre space, it will also afford to the spaces next the corn a medium (2 feet 1½ inch) between those of the corn and the green crop. In the same breadth of ground (12 feet 9 inches), Mr. Smith would have 7½ rows, but I would expect from these three double rows a produce at least equal to that which his 7½ rows would give; while, in the intervals, I should have in addition half an average green crop. Perhaps the following diagram will more intelligibly express my meaning.



character of the society. As nearly every village can now furnish a cricket club and the elements of a band of music, so might reading and drawing be added to the list of recreations, and a hundred books of an entertaining and instructive character may be readily procured at a small cost from the "Railway Library," "Traveller's Library," "Chambers' Course," and other series of educational and amusing works, with one or two periodicals. I should be disposed to recommend "Constance" to look to the young people of the village rather than the more advanced in life for supporters of her project; and probably every place containing 50 inhabitants and upwards would produce two or three persons having an aptitude for establishing a literary society; and if they could afford to "take in" a daily paper one or two days after publication, the older inhabitants might be won to contribute their mite, whether of money or mind. Whatever is done by "benevolent" people should be in unison with the wishes, and, as much as possible, introductory to the free and unbiassed exertions of the individuals themselves for whose benefit the undertaking is presumed to be planned and executed; and if the effort is made by one village, or by two or three conjointly under the patronage or cognisance of "Constance," I hope she will in return let us know the results of her kind disposition to promote the happiness of her neighbours, after having summoned a meeting of the friends of progress within her circle, to frame a few simple rules, hire a room, choose a few books, and organise a committee that will direct the young society to a prosperous and useful career. *J. W., Peterborough.*

Anbury.—The lower greensand in Oxfordshire is subject to anbury in the Turnip crop, with the exception of those spots covered by the calcareous gravel of that district. The mere application of this gravel in a raw state has been known to cure the disease; the application of the scrapings of roads made with this material is an unfailing remedy. It is impossible to doubt Mr. Paine's assertion when he attributes the disease entirely to the condition of the soil. Surely this question is settled. *J. C. C.*

Seed Growers' Society.—At page 667 of the *Gardeners' Chronicle* is to be found a brief notice of a society of seed growers, who wish to emancipate themselves from the shackles in which they have been held by a few persons in the London seed trade. In attempting to accomplish this object I wish them every success, and also every fair remuneration for their labour and capital expended; but the public have yet to learn, through the columns of the *Gardeners' Chronicle*, whether they are still further to be inundated with a spurious supply of garden seeds, or that an improved system is likely to be introduced and pursued by the Seed Growers' Society in producing quality in opposition to quantity. Of the quality hitherto produced the British public have already had *quantum suff.* In the same number of the *Chronicle* we are told "that the market price of everything depends on the fineness of the sample." Now, it is impossible for us to judge of the quality of garden seeds by the sample produced; for it is very well known that the finest sample of seed is frequently obtained from, and produces, the most worthless crop. What have we then to fall back on? Assuredly nothing but the character of the grower, concerning which the said society holds out no expectation or promise; and without this guarantee of attention to the production of quality, no such society, with the intentions of the above-mentioned, can expect to secure the reliance and confidence of the gardeners of the United Kingdom. *Robert Jones, Battersea, Oct.* 19.

Potato Crop in Ireland.—Our Potato crops in general are turning out much better than was expected. The farmers mostly are satisfied with them. Our grain crops good and beyond average. Very little Wheat here; but what there is, free from mildew (red). I have a small plot, one-tenth of an acre, under White Wheat (Red Chaff White), the leaves of which were so mildewed that I expected the grain would have been destroyed; it has not, however, suffered. I never saw leaves with more rust on them. In hoeing the rows shortly before blossoming I was covered with it. I was quite an Orangeman. In the same ground last year the same Wheat scarcely showed so much rust in the leaves, and yet I think I may say two-thirds of the grain were mildewed. In both cases the seed was sown in the latter part of the month of March. *J. M. Goodiff.*

On Premiums to Farmers.—In your Paper of Oct. 21, "J. M." assumes that farmers are merely the recipients of rewards provided by other people, whereas the greater part of such premiums are subscribed by the farmers themselves. "J. M." says there have been no premiums held out to manufacturers. Under what category, I would ask, does he rank industrial exhibitions, now so common in the provinces, after the great exhibition of 1851? "J. M." says "the agriculture of the country has benefited very little by the continued succession of premiums to farmers during this century." He is in error! Agriculture has made great advances, and those advances may be traced in a great measure to the operations of agricultural societies. The exhibition of good live stock tends to a rivalry in the possession of well bred animals; and the introduction of a fine bull into a neighbourhood by the inducement of a premium is followed by an immediate improvement in the young stock produced in that locality; prizes are not usually awarded for a dozen, but for a piece of Turnips not less than a certain number of acres. The relation of landlord and tenant is more open to objection, although it is not uncommon that the tenant is as much to blame as the landlord. There should undoubtedly be more certainty about occupation than can belong to a yearly tenancy; the system of leases, if simplified, would be eminently beneficial to the country, due care being exercised that at the close of a lease land is maintained in good heart, clean, and fertile. Some landlords are too willing to take advantage of a tenant; some tenants set law and custom at defiance in the management of their land. Now, in proportion as farmers' wives are at liberty to dress, and play the piano, and speak Italian (if they can afford it), and in proportion as farmers themselves are permitted to walk out of leading strings, and have opinions of their own on local and political questions, so in all probability by the elevation of the class will farmers select their stock, till their land, use good implements, and pay rent and wages at an exemplary rate and in first-rate style. Talk of no improvement in agriculture! Go to any well-frequented market, and look at the samples of corn; see the manner of doing business both by buyers and sellers; every transaction tells powerfully in favour of the "diffusion of knowledge," and increase of the independence as well as the integrity and intelligence of the farmers, who may have been a while ago the victims of prejudice, but I firmly believe that there is at the present time far more prejudice nurtured and retained against farmers than can be proved now to exist amongst them. *J. W.*

Pigs and Box Feeding.—I noticed, in No. 35, for September 2, page 570, it is said in a note "Pigs ought not to be bedded on the box-feeding principle at all." May I ask, is this a well-established fact? I have known instances in which they have been so kept, and have done extremely well. I remember one summer as soon as the cows were turned out to Grass from four boxes, the partition rails were removed, and about 30 pigs put in to fatten. I never saw pigs do better or fatten quicker; they had a small quantity of fresh litter added every day, and the quality of the manure by autumn was first-rate. Last autumn I kept one pig on the same system, bedding him with stable dung, and did not remove it until the pig was killed; the pig was perfectly healthy, and fatted well; the court of the sty is not under cover. In both these instances I believe the noses of the pigs were "rung" to prevent their turning the manure up after it had been levelled. I should much like to hear the other side of the question, as I can find no objection to the box for pigs. *F. G.*
[The other side of the question is that from the rooting about of which a pig is always guilty, the litter under it is not trampled and hardened as it is under other animals, and fermentation sets in, so as to render its lair pestiferous, instead of sweet and cleanly as it is under the ox.]

Extraordinary Cow.—In your last Number, "A Subscriber of Many Years" asks if I can mention the breed of cow which gave 30 quarts of milk per day, and 16 lbs. of butter per week. I cannot, for she was bought from a small farmer in the neighbourhood, who had kept the sort for 30 years for their excellent milking qualities; she has, however, very much the appearance of a cross between the Ayrshire and the shorthorn. She is neither a large nor a handsome cow; the propensity to deep milking keeps her very lean, however good her pasture. She has had four calves; and now at the end of 20 weeks after calving is still milking very well; at the twentieth week from her calving her milk was again kept separate from the rest, and it was found that she gave 15 quarts of milk per day, and 11¼ lbs. of butter per week, or 1¾ oz. per quart; whereas, when she gave 30 quarts per day, the yield of butter was barely 1¼ oz. per quart of milk; but the weather was then cold and wet, whilst during the other experiment it was warm and dry, which I think was quite sufficient to account for the difference in the proportion of butter. It may be that in the milk of a newly-calved cow there is less butter and more casein, but there is no doubt that dry warm weather increases the quantity of cream. In all the three experiments the cow was kept in the field, and, in all, the milk was only allowed to stand 24 hours before skimming off the cream. Your correspondent "Y." tells me that his milk yields on the average 1½ oz. of butter per quart; but his land is better than mine, and he is a very scientific manager—keeping his milk-bowls standing in water, which he keeps as nearly as possible at one temperature (I think 55° Fahr.), and this enables him to keep his milk longer before skimming, which of course increases his quantity of butter. I hope he will be induced to give us some papers in the *Agricultural Gazette* on the management of milch cows and the dairy; he is quite as competent to treat on this as on stall-feeding. I do not need to say more. I have procured Kiall's translation of Guenon's "Traité des Vaches Laitières," and, with it in my hand, have endeavoured to ascertain how far the known qualities of my own herd of milch cows (22) agree with his "signs," and I find that so far as I can make them out they correspond very closely. I must admit, however, that although in many instances these signs are very clearly defined, yet in others they are so vague and indistinct that I am in doubt about them. Has this treatise of Guenon's had much attention paid to it in England? and is it worthy of attention? If I recollect aright, Mr. Pusey spoke favourably of it, but elsewhere it has apparently attracted little attention, as I do not remember to have seen it alluded to in your columns more than once or twice. Yet if these signs are to be depended on, it is well deserving of notice. [The subject is fully discussed in the little book published by Messrs. Blackie, "How to choose a good Milch Cow."] I scarcely think dairy matters are sufficiently discussed in your paper; yet to me they seem very important. Your correspondent "Y." says (Oct. 7, p. 652), "A comparison of the two processes of producing milk and fattening shows the remarkable result that by the former, though at a somewhat greater expense of food, you may provide three times the amount of nutriment fitted for the use of man as by the latter, as flesh contains fully three-fourths of water in its composition; if you carry out the like proportion in the increase by each process, the result by fattening would show a gain of 9 lbs. per day or 63 lbs. per week, an amount it seems impossible to attain." If, as I believe, the keeping of dairy cows is much more profitable than feeding, when new milk is sold at 2*d.* per quart, skimmed milk at half that price, and butter at 1*s.* per lb., whilst beef sells at 6*d.*, it is surely desirable to cultivate those breeds of cattle which are suited to the dairy rather than those which give little milk, whatever may be their tendency to fatten, and therefore I conclude by reiterating the advice of an acquaintance of mine, notwithstanding its apparently ludicrous absurdity—"put your cow to a bull that is a good milker." *T. G., Clitheroe.*

Agricultural Teaching in Ireland.—"We were ignorant because education was denied us," writes Sir Robert Kane, in his inimitable work, "Industrial Resources of Ireland;" and nothing could be more true as regards Ireland generally, but as regards agriculture more especially, till within a late period, when the Government, through the Board of National Education in Ireland, has to some considerable extent contrived to relieve themselves of so disgraceful a reproach in as far as the humbler and smaller classes of farmers are concerned. If any one doubts the truth of this he has but to visit the Albert Training Institution at Glasnevin, near Dublin, and if an unprejudiced observer he must return with his doubts fully removed. For a long time, and indeed until lately, I was one of the many who felt prejudiced against this institution whilst it was called "a model farm." The case is quite different, for although not such a model as all, perhaps very many Irish, or even Scotch or English farmers would call a model within their reach of imitation, it is truly a model to all her Majesty's dominions as an agricultural educational establishment. I have said, that until lately I had strong prejudices against this establishment, and I cannot say they are all removed yet, because I believe that all the wants of such an institution are not filled up; yet it would be an injustice, which I would be amongst the last to attempt to inflict on the institution, or on any one of those connected with its government or management, did I hesitate to express my belief in the anxious desire of those concerned in its management, to remove any objection that can be raised against it, by supplying everything in justice which the most fastidious could reasonably desire. On last Thursday there was a "gathering" there of some of those most competent to judge of the value of such an education, and the best modes of conveying it, and to hear the opening lecture of Dr. Hodges, of Belfast, on veterinary surgery, being a part of our agricultural education of which we stand in such need in Ireland. All were sadly disappointed at the learned gentleman's unavoidable absence, caused as it was by the sudden death of a near friend. But his absence was to some extent compensated for by the delivery of a lecture of another kind on a matter of not less importance, by no less a personage than Professor Playfair, of London. But more important still in my mind, as I have reason to believe in the minds of most, if not of all present, was the display made by the pupils in answering practically and scientifically in the different classes of the educational courses taught by the respective professors, showing thereby the great facility exercised in teaching by these professors, and the great aptitude of the pupils to imbibe and retain practically as well as theoretically the philosophic principles there enunciated. Where there appeared so much perfection it would be difficult to make special selections; one case out of the many which all observed may suffice for this purpose:—Mr. Baldwin, the mathematical professor, singled out one whom I believe to be among the youngest boys, as well as one of the latest who entered that establishment, and had him, I know from my own knowledge, without any formal or extraordinary preparation, to adjust and explain the construction and application of some of the most difficult as well as of the most valuable of the mathematical instruments used in agricultural and general engineering, and prove the practical application of them to the general purposes to which they are applicable, on purely mathematical and scientific principles. In doing so, Mr. Baldwin stated what I know to be a fact, that the boy, when he entered that institution, knew scarcely anything whatever of mathematics, his early education having been of a different character to what is required for agricultural pursuits. To some it may appear strange that these answerings should excite any, even the least surprise, on reflecting on the fact of this boy's having been fully six months in this institution. The case is differently felt by those who are acquainted with the very short time devoted there to literary and mathematical studies—a time hitherto far too short, but which is, I am proud to say, now more prolonged by some late salutary arrangements in the school hours. We have no manufactures in Ireland but those of food, a matter of no slight moment now-a-days; that being the case, too much cannot be said or done by and for us to enable us to do so with the greatest advantage to the consumer as well as to the producer, and this can only be done through the agency of education, now no

longer denied those who can benefit by such an institution as that at Glasnevin. Still those classes are only a portion of the Irish people, and certainly not those now most in need of it compared to the classes above them, to whom my next letter will refer, if this be found worthy of a place in your agricultural pages. *Veritas, Dublin, Oct. 9.*

Farmers' Clubs.

PROBUS, *Sep. 30 : The Climate of the West of England.*—Mr. Whitley said :—The effect of climate on the corn crops of the west is most obvious, from the results produced in the past two years. In 1853 we had a remarkably dry spring, followed by a very wet summer, which continued up to the time of a deficient harvest ; the sickly and diseased Wheat plant yielded a very thin head and defective grain. The spring of 1854 was of a similarly dry character; the east wind blew continuously for more than a month, covering this land with the dry air of the continent ; the rain set in just at the same period as in the previous year, and continued through the summer with a remarkably low temperature, until the crops, abundant in straw, began to quail under its influence; but, when the prospects looked the most gloomy, in opposition to our fears—contrary to the course which nature had taken in the previous year, the sun dispelled the clouds, suddenly raised the summer temperature far above the average, and drew forth from the half fainting plant a healthy well-filled ear. It would be difficult to estimate the average loss in the Wheat crop from the defects of our climate, but it is not perhaps too strong a statement, that if the same skilful husbandry were bestowed on the same soil when the climate is all that can be desired to bring the Wheat to perfection, at least one-third more in produce would reward the cultivator. But if there are some defects in our climate injurious to cereal crops, it is on the whole highly favourable to the production of a large amount of human food. The seasons are free from great extremes of temperature. In central Europe the heat, radiated from a large continent, becomes extreme in summer, and the cold of winter is equally intense. In North America the winter snows cover the ground for months, till, on the return of spring, vegetation rushes into renewed life ; the sun, having obtained the mastery, appears to glory in his might, and a tropical temperature is felt, where shortly before an active winter reigned. But with us the summer's sun often leaves the unripe Grapes to perish on the vine, and the skater finds no field for his favourite sport. We have also a comparatively slight difference between the temperature of night and day. On the hills of Syria the prophet shepherd said, "the frost consumed me by night, and the drought by day ;" but on our coast lands, the air from the sea preserves a uniform temperature. The water of the sea seldom sinks in the depth of winter below 46°, so that frost can rarely touch the plants on the shore. From this cause the neighbourhood of Penzance, and more particularly the Scilly Isles, are well adapted to the growth of the early Potato ; and no doubt the same root might be grown at the south-western extremity of Ireland with equal success. Ours is a country diversified by hill and dale. Not like the marshes of the Danube, where the marsh poison lies on the swampy surface ; not like the plains of India, where you must sleep above the fever line or perish ; nor like the sandy plains of Africa—the ovens of Nature—or the parched lands of Arabia : these are countries where (in the language of the East) the earth is fire and the wind is flame ; where the sun is the monarch of the day, and vegetation droops and animated nature moans beneath his influence. The Affghans have a saying—"Great God, why hast thou made hell, since there is Ghizni ?" But from our green hills the minor impurities sink nightly into the valleys below, and leave on the grassy slopes a dry and healthy atmosphere. Gardens and orchards on low ground become filled with cold air, throwing out fog, and so producing Moss ; gendering hoar-frost, and so cutting off the blossoms. Fruit trees should be on a southern slope, with a hoe ditch on the lower side ; and cattle yards and our own dwellings should be placed above the cold night air of the valleys. Humidity is another characteristic of our climate, resulting from the great evaporation arising from the warm surrounding sea. At this time of the year the struggle between the sea-fog and the warm air on the land may often be observed ; the air absorbs the fog, until, in the cool of the evening, it obtains the mastery, and envelopes the land. On the return of day the rising temperature drives it again to sea, when it hangs about the horizon to return at night. The surfaces of trees also condense the vapour, producing Moss and Fern on the limbs ; and the leaves drop water into the cattle ponds, though no rain is falling. The rain-clouds often pass over the coast lands before they deposit their moisture, and the western inland slopes receive the largest quantity. In 1853 some good Wheat was grown on the north coast, whilst it struggled on to a half crop inland. The effects of climate are seen in the little Pimpernel, which closes its leaves and hangs it head to avoid the storm ; in the Sunflower, which lifts its petals to receive the rays of light and heat ; in the winter coats of the cat, the horse, and the sheep ; in the migration of animals and birds ; in the noble horse of Arabia, compared with the Shetland dwarf ; in the winter torpidity of some animals, and the summer activity of others ; and it becomes us to study the causes which produce such effects, and to adapt our culture, our plants, and our animals, to the climatic influences they must encounter.

Miscellaneous.

On the Sewerage of Manufacturing Towns.—The analysis, made by Dr. Wrightson, of a natural deposit from the sewerage of Birmingham, formed near the embouchure of several sewers opening into the Rea, showed the absence of all ammoniacal salts and the scarcity of phosphates, particularly alkaline phosphates, and, at the same time, the presence of a large quantity of protoxide of iron, also of zinc, copper, and other metals in the state of oxides and sulphurets. These metallic salts, in the sewers, absorb the sulphuretted hydrogen and ammonia generated by decaying vegetable and animal matter, and, doubtless, contribute to promote the health of the town. The deposit contained when dried only 1·4 per cent. of nitrogen (not as ammonia) and 3·5 of earthy phosphates ; but about 11·7 of protoxide of iron, besides zinc, copper, and other metals to the extent of two or three per cent. The author hoped these facts would not be lost sight of by corporations and other bodies interested in economising town sewerage. *Dr. Wrightson, at the British Association.*

Agricultural Statistics.—A circular has been addressed by the Poor Law Board to the officials of the Unions in the several counties where the collection of facts relating to agricultural statistics is proposed to be made for the present year, and we make the following extracts :

"The experiment for 1854 will embrace the whole of Scotland and the following counties of England and Wales—viz., Norfolk, Suffolk, Southampton, Wilts, Leicester, Berks, Worcester, Salop, West Riding of York Brecon, and Denbigh. In Scotland the proceedings will be conducted, as in 1853, under the auspices of the Highland Society. In England and Wales it is intended to put in motion the machinery which worked, upon the whole, so satisfactorily in Norfolk and Hampshire. In Norfolk and Hampshire it was found that this object was best promoted by the formation and co-operation, in every union, of a joint committee of owners and occupiers called 'the Statistical Committee,' with the chairman of the union for its chairman, and by employing, with the concurrence of the guardians, the clerk of the union as classifier, and the relieving officers as enumerators. The countenance and support which a committee so constituted affords, by the mere fact of its existence, as well as by the employment of the union officers under its directions, go far to insure success, and I trust you will find no difficulty in organising such a committee among the leading agriculturists of your union. The duties of the committee are not of a nature to subject its members to much personal trouble. All, or nearly all, they have to do may be summed up under the two following heads:—To induce, by their example and influence, their neighbours to fill up their schedules before September 30. To superintend the labours of the officers engaged in the inquiry, and to examine and verify the results. The results of the experimental proceedings in Norfolk and Hampshire, which were unavoidably prolonged through a severe winter, seem to prove that the relieving officers may, without detriment to the administration of relief, properly be intrusted with this employment. Still, the Poor Law Board are very far from wishing to restrict boards of guardians to the employment of their officers, whenever they see occasion to apprehend that it will be productive of inconvenience or mischief."

Notices to Correspondents.

BREWING : *S S.* As to porter the following quantities divided by seven will make the quantity you want :—"For making porter, three kinds of malt are necessary—the pale malt, the brown malt, and the patent black malt. For making ahogshea d without table-beer, 4 bushels of pale, 2 bushels of brown, and 14 lbs. of patent black malt are employed. The malt having been crushed or ground 48 hours previously, 60 gallons of boiling water are run into the mash-tun, and when reduced with cold water to the temperature of 180° or 182°, the malt is put in, in a similar manner as for the ale. It is mashed for 20 minutes or more, until it is brought to an equal consistency. The cover is then put on, the malt sacks and the blanket placed on the top of it, to keep the wort as warm as possible. In the meantime the copper having been re-filled, the water is preparing for the second extraction. The mash stands thus covered for an hour and a half, the tap is partially turned, the first running received in a pail until it appears clear ; when the contents of the pail are returned into the mash-tun, and the extract allowed to run into the underback. When 35 gallons have been run off, the tap is turned, 35 gallons of water, at a temperature of 190°, are strewed over the bed of the grains, in like manner as described for the ale, and allowed to remain covered up for one quarter of an hour, then run off into the underback in the same way as the first extraction, leaving the grains perfectly dry. The copper being empty and the fire damped, the wort, which should measure 74 gallons, is put in as quickly as possible, with 4 lbs. of the best East Kent Hops, and boiled briskly for 30 or 40 minutes. The remaining 4 lbs. of Hops are then added, and the whole is boiled an additional 25 minutes. A portion may be taken from the copper and examined : and should the operator not find it so brown as he wishes, he may put in 10 oz., or 1 lb., of the best Italian juice, broken, that it may dissolve. In fact, this juice should be put into the copper with the first quantity of Hops. The wort is then run through a sieve into the cooler ; the farther process is the same as the ale." That is to say 4 lbs. or 5 lbs. of yeast are mixed with a gallon of the wort at the temperature of 85°. "When fermentation has commenced in this portion, another gallon of wort is added to it; and just before the worts are cooled down to the proper temperature, 67° in moderate weather, and 73° in winter, these 2 gallons containing the yeast, which will not be in a state of fermentation, are strewed or spread over the fermenting tun, and the worts let down upon them." In a couple of days the liquor may be casked. The above directions are taken from "Roberts' British Wine Maker."

DRAINS : *A B.* puts a question one part of which we do not understand and the other does not admit of an answer. How "far" will a 2½-inch pipe carry off the water, &c.? It would be possible to say how much water such a pipe under a given pressure would deliver, but as to the distance, whether from the field or from itself in the field, we cannot say. If the latter is meant, that depends not only on the depth (four feet) which is given, but on the texture of the soil and subsoil, which words cannot definitely describe. It is quite possible that 4 feet drains, 50 feet apart, may be an efficient drainage of the land ; and as to the number of acres from which a 6-inch pipe will carry off the water, that depends on the rain fall of the year—on the liability to great rain falls at particular times—on the slope of the drain—and on the existence or non-existence of springs within the area.

MICROSCOPIC OBJECTS : *A Medical Subscriber.* We doubt if such "slides" are to be obtained. Apply to Carpenter and Westley, Regent Street. We cannot answer your question about Life Assurance ; but we imagine it needs a Royal charter to insure limited liability.

SMALL FARM : *Youngster.* Perhaps we may be able to draw up a complete scheme for you soon ; in the meantime it is plain your chief object should be to provide winter green food fit for dairy cows, such as Rape, Mangold Wurzel, Parsnips, and perhaps Cabbage.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

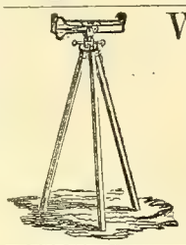
JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water ; Fire Engines, &c.

WEIR'S DRAINING LEVEL,

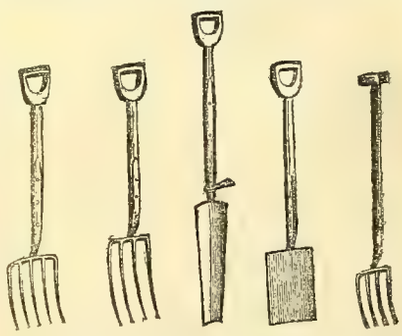
PRICE 30*s.*



These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback ; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

PRIZE MEDAL—1851.

AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON AND BUILDER, PIMLICO MARBLE AND STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

Squares	6 by 4 and 6½ by 4½	...	...	... 13	6
"	7 by 5 and 7½ by 5½

2, Talbot Court, Gracechurch Street, London.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

E. ELEY'S HOT WATER WORKS, and improved Hot Air Works, opposite the Eagle Tavern, City Road, London. Manufacturers of the various descriptions of HOT WATER APPARATUS for Heating Horticultural Works, Churches, and other Public Buildings, Mansions, Offices, Baths, &c., on the most scientific principles. Manufactories requiring artificial heat fitted up with effective and economical apparatus by contract or otherwise. Old work taken down and remodelled. Architects, Surveyors, and the Trade attended to in any part of town or country.

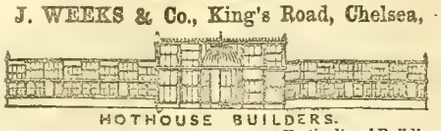
E. E. being a practical and scientific workman defies competition. Parties by sending a rough sketch of their building can be supplied with the most improved Pipe Boilers, or any other description, with connection and piping fitted and marked with a plan, cement, &c., for joints, so that a gentleman's own tradesman or gardener can fix them.

N.B. Please to observe the Address. No connection with any other House in the Trade.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, ENGINEER, Battersea.

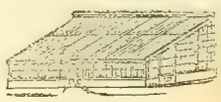
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

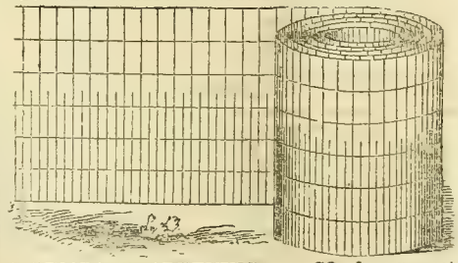
BY HER MAJESTY'S ROYAL LETTERS PATENT.



MESSRS. B. GREENING AND CO. beg respectfully to call attention to their superior WIRE FENCES, of which the following are the principal varieties:—Portable Horse and Cattle Fencing (Economical variety of ditto), Portable Sheep and Lamb, Proof Fencing, Poultry Fence, Portable Hare and Rabbit-proof Fencing, Ornamental Garden Fences, Export varieties, Poultry and Chicken-proof Fencing. Light and cheap kinds of most of the above. Trainers for Peas, &c., Garden Bordering, Tree Protectors, Hen Houses, Poultry and other Aviaries, &c.

Messrs. B. G. & Co. being the sole patentees for the machinery for manufacturing these Fences, will forward engraved sheets of Patterns, Prize Lists, Prospectuses, &c., gratis, on application to their establishments, 1 and 3, Church Gates or 2 and 2 A, Cateaton Street, Manchester.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

WIRE FENCING, 6¾*d.* per square yard, in various widths, from 6 feet to 15 inches, mesh less than 2 inches. An effectual fence against Hares, Rabbits, Sheep, Deer, &c., and for the enclosure of Poultry, Pheasants, &c. 4-inch mesh, 4*d.* per square yard.

R. RICHARDSON, 21, Tonbridge Place, New Road, London.

GARDEN NETS, FISHING NETS, SHEEP NETS, AND RABBIT NETS, made by Machinery, and supplied at very low terms. Samples sent free.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide, 1*s.* per yard run—admits light and excludes cold; thick Canvas Tarpauling, 1*s.* per square yard; thick Canvas Waxed Sheeting, 1*s.* per square yard, may be had various widths. These Canvases are excellent for roofing Sheds and Outhouses, as they are quite waterproof.—R. RICHARDSON, 21, Tonbridge Place, Judd Street, New Road, London. N.B. Waterproof Capes, large size, 3*s.*; Police Capes, 18*s.* and 24*s.* per dozen; Driving Aprons, Capes, and Coats of India Rubber, Horse's Loin Cloths, Waggon and Cart Covers, Sacks, &c.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

FREE ADVICE TO THE NERVOUS and Novel Observations on Nervousness franked, if one stamp is sent. The same benevolence, and not love of gain, which for 20 years has induced the Rev. Dr. WILLIS MOSELEY to give advice FREE to the Nervous, brings him daily to London, 18, Bloomsbury Street, Bedford Square, from 11 to 3, when the Nervous may have his advice Free and be cured for the cost only of the means of cure. Of 30,000 applicants 50 are not known uncured who have followed his advice. Apply or write. Means of cure sent to all parts.

FREEDOM FROM COUGH IN TEN MINUTES is insured by DR. LOCOCK'S PULMONIC WAFERS. From Mr. J. W. Bowden, bookseller, Market Place, Gainsborough.—"Several persons in this neighbourhood, who have been afflicted with apparently incurable asthmas and coughs for a series of years, have found relief only in the use of Dr. Locock's Wafers." These wafers give instant relief and a rapid cure of asthma, coughs, and all disorders of the breath and lungs. To singers and public speakers they are invaluable for clearing and strengthening the voice. They have a pleasant taste. Price 1*s.* 1½*d.*, 2*s.* 9*d.* and 11*s.* per box. Sold by all medicine vendors.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1*s.* 1½*d.* per box.—Observe that "THOMAS PROUT" is on the Government stamp.

BLAIR'S GOUT AND RHEUMATIC PILLS Price 1*s.* 1½*d.* and 2*s.* 9*d.* per box.—Mr. William Courtney, of Barton Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp.

HOLLOWAY'S PILLS A PROMPT AND CERTAIN CURE FOR BILIOUS AND LIVER COMPLAINTS.—Mrs. Mary Cook, of Mayling's Green, near Romford, had been suffering for some years from bile, sick headaches, and a severe liver complaint, for which she tried almost every medicine usually taken for such complaints, but could obtain no relief whatever, she then had recourse to Holloway's Pills, and so wonderful was the effect of this inestimable medicine, that in a very short time she has been completely cured by their use, and now enjoys better health than ever. Mr. Yull, Druggist, Romford, can testify to the truth of this statement.—Sold by all Vendors of Medicines, and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

PARR'S LIFE PILLS.

THE English public have, by the test of experience, become satisfied that PARR'S LIFE PILLS are composed of simple but powerfully curative ingredients. They are so mild and excellent in their action that a child may take them. For Bilious Disorders, Liver Complaints, Indigestion, Costiveness, Sick Headache, Depression of Spirits, Pains in the Back, Gravel, and Lumbago, PARR'S LIFE PILLS will be found a safe and admirable remedy. Invalids should make an immediate trial of this excellent, long-tried, and successful medicine.

TO LADIES.

PARR'S LIFE PILLS are especially efficacious in all the variety of ailments incidental to the fair sex. Ladies, even of the most delicate constitutions, will find them particularly beneficial both before and after confinement; and, for general use in schools, they cannot be too strongly recommended. They mildly and speedily remove all skin eruptions, sallowness of complexion, nervous irritability, sick headache, depression of spirits, irregularity, or general derangement of the system.

Observe the signature of the proprietors, "T. ROBERTS & Co., Crane Court, Fleet Street, London," on the directions. Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable chemists and medicine vendors in town and country. Full directions are given with each box.

☞ Be sure to ask for PARR'S LIFE PILLS.

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge.
ESTABLISHED A.D. 1700.

TEN THOUSANDTH STOVES.

THE TENTH THOUSAND OF THE PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, AND CO., 46, King William Street, London Bridge; and may be obtained of most Ironmongers.

The IMPROVED PATENT VENTILATING STOVE, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded post free.

FLAVEL'S PRIZE KITCHENER.

THESE RANGES are strongly recommended for their simplicity of construction and their economy and cleanliness in use. The top forms a Hot-plate, and the open fire removes many of the objections which are felt to close Ranges. They are made in all sizes, from 3 feet to 18 feet in width, suitable for large or small establishments. They are admirably adapted for the Cure of Smoky Chimneys.

London agency removed to Wigmore Street, from 92, Jermyn Street, Piccadilly.

BENHAM & SONS, 19, Wigmore Street, London.
And in the Hardware Court of the Crystal Palace, Sydenham.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,
2dly,—From those purchases being made exclusively for cash.

PAPIER MACHÉ AND IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

New oval Papier Maché Trays, per set of three	...	...	from 20*s.* to 10 guineas.
Ditto, Iron ditto	...	...	from 13*s.* to 4 guineas.
Convex shape, ditto.	...	...	from 7*s.* 6*d.*

Round and Gothic Waiters, Cake and Bread Baskets equally low.

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are now ON SHOW in one of his TEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Establishment the largest and most remarkable in the kingdom, viz. from 12*s.* 6*d.* (two lights) to 16*l.*

LAMPS OF ALL SORTS AND PATTERNS.—The largest, as well as the choicest, assortment in existence of FRENCH and ENGLISH MODERATEUR, PALMER'S, CAMPHINE, ARGAND, SOLAR, and other LAMPS, with all the latest improvements, and of the newest and most *recherché* patterns, in ormolu, Bohemian, and plain glass, or papier-mâché, is at WILLIAM S. BURTON'S, and they are arranged in one large room, so that patterns, sizes, and sorts can be instantly selected.

Real French Colza Oil, 4*s.* 6*d.* per gallon.
Palmer's Candles, 9*d.*, 9½*d.*, and 10*d.* per lb.

DISH COVERS AND HOT-WATER DISHES in every material, in great variety, and of the newest and most *recherché* patterns. Tin Dish Covers, 6*s.* 6*d.* the set of six; Block Tin, 12*s.* 3*d.* to 28*s.* 9*d.* the set of six; elegant modern patterns, 34*s.* 0*d.* to 58*s.* 6*d.* the set; Britannia Metal, with or without silver-plated handles, 76*s.* 6*d.* to 110*s.* 6*d.* the set; Sheffield Plated, 10*l.* to 16*l.* 10*s.* the set; Block Tin Hot-water Dishes, with wells for gravy, 12*s.* to 30*s.*; Britannia Metal, 22*s.* to 77*s.*; Electro-plated, on Nickel, full size, 11*l.* 11*s.*

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

39, OXFORD STREET (corner of Newman Street); Nos. 1, 2, and 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

GRANITE.—ENTRANCE GATE PILLARS, COPINGS, and every kind of Yard and Stable Pitching; Field and Garden Rollers, Stack Pillars and Caps, Cattle Troughs, Window Sills, and at prices reduced by railway carriage.

Apply to H. SWIFT, Brent Moor, Ivy Bridge, South Devon.

Specimens to be seen at the Wharf, Globe Bridge, Globe Road, Mile End, London.

Monuments according to design and estimate.—Agents wanted.

TO ROADMAKERS, BRICKLAYERS, AND NURSERY GARDENERS.

THE BURIAL BOARD for the Parish of Boston, in the County of Lincoln, are prepared to receive Tenders:—

1st, For the construction of the several Roads, Walks, and Drains in the new Cemetery of the said parish of Boston.

2d, For constructing a Circular Tunnel, and building the Parapet Walls and Pillars, &c., in front of the Entrance Lodge of the proposed Cemetery.

3d, For the supply of Trees, Shrubs, and Plants for the said Cemetery.

Plans and Specifications, with a detailed Estimate of quantities for the several contracts, may be seen at the Office of Mr. SIMPSON, Solicitor, Boston, of whom further information may be obtained. Tenders, sealed and endorsed "Burial Board Tender," are to be sent to Mr. B. S. SIMPSON, on or before Monday, November 6. The Board do not bind themselves to accept the lowest or any Tender. (By Order of the Board.)

Boston, October 23. B. S. SIMPSON, Clerk.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 11*s.* per ton; ditto, delivered 5 miles, 16*s.* per ton. Loam and Peat at moderate prices.—KENNARD BROTHERS, Swan Place, Old Kent Road, London.

VALUABLE FREEHOLD NURSERY GROUNDS, ETC., FULFORD ROAD, YORK.

TO BE SOLD, by private contract, the long-established and flourishing NURSERY PREMISES of the late Mr. George Clarkson, situate on the banks of the Ouse, York, comprising about 14 acres of first-rate Nursery Ground, well stocked with Forest and Fruit Trees, Shrubs, &c., and having a substantial DWELLING-HOUSE, SHOPS, and GREENHOUSE, and other requisite Out-buildings attached. The purchaser will have the option of taking the whole or part thereof, and the Stock on liberal terms. Immediate possession can be given, and plans and particulars may be had on application to Mr. LUKE THOMPSON, Solicitor, York.

TO BE SOLD CHEAP, STRONG-BUILT GREENHOUSES, 12 feet long 8 feet wide, 15*l.*; 16 by 10, 20*l.*; 18 by 10, 25*l.*; 20 by 12, 35*l.*; 23 by 12 40*l.* Plans and particulars of Mr. SMITH, 1, Lower Road, near Islington Green. Window Blinds, Sashes, Doors, &c., from 6*d.* per foot. Stout Horticultural Glass at 2½*d.* per foot. Orders to all parts.

CHELMSFORD, ESSEX.

TO BE LET, on Lease, a highly-productive and well-stocked NURSERY GARDEN of about 2 acres, close to the town, with excellent Fruit Walls; Pump, and Reservoir of Water; the erection of a Forcing-house, Pit, and two Sheds. The Nursery Stock now on the ground to be taken by valuation. The rent will be unusually moderate.—Apply to VALPY & STOKES, Auctioneers, Chelmsford, Essex.

TO BE LET, in Birkenhead, rent 20*l.* per annum, a SHOP, in which a Seedsman (lately deceased) has carried on a profitable business since 1847. Immediate possession can be given, and little more required from an incoming tenant than a fair price for fixtures and stock on hand.—For particulars apply to Mr. PATERSON, Solicitor, 30, Castle Street, Liverpool.

TO BE LET, by tender, a FARM on HAFODUNOS ESTATE, North Wales, comprising 328 acres, great portion of which has been thoroughly drained, sub-soiled, and highly improved, and the remainder is now being similarly treated. The House will be altered and additional buildings erected to suit the tenant. Hafodunos is 9 miles from Abergele, 6 from Llanrwst, 10 from Conway, and 13 from Denbigh.—Application to inspect the farm to be made to Mr. SCOON, Bailiff, Hafodunos, by Llanrwst, and further particulars may be obtained from Mr. PALIN, Christleton, near Chester, to whom offers in writing are to be made.

MONMOUTHSHIRE.

TO BE LET, for a term of years, and entered upon at Lady-day next, the FARM of LLANVAIR GRANGE. It consists of 164 acres of rich productive Land, of which 4 acres are in Orchard, 76 in Meadow and Pasture, and 84 are Arable. There is a comfortable Farm-house and Garden, Dairy and Cheeseroom, and ample Farm Buildings on the Farm. It is within a short distance of the Pontypool Iron Works; there is a station on the Newport and Hereford Railway close by. At the Iron Works there is a constant demand for every kind of Farm produce. The proprietor at Llanvair Grange will direct some one to show the Farm; and for particulars apply to Mr. JOHN MORTON, Morningside, Nailsworth, Gloucestershire.

TWO FARMS,

A FEW MILES FROM THE CITY OF CHESTER.

TO BE LET, by Tender, an excellent DAIRY FARM, containing 150a. 2r. 14p., called Rushall Hall, situate in the parish of Tattenhall, in the county of Chester, two miles from Tattenhall Station on the Chester and Crewe Railway, in the occupation of Mr. George Robinson. A great portion of the Farm has been thoroughly drained, and a portion of the Grass Land boned; and it is contemplated to complete the draining and boning of the Farm the ensuing winter. The House is commodious and will be put into thorough repair. The present Farm Buildings will be taken down, and an entire new set o buildings suitable to the Farm erected. Possession of the House on the 12th of May, and of the Lands on the 2d of February next.

Also an excellent DAIRY FARM, containing 156a. 2r. 23p. At present a part of the above Farm is in the occupation of Mr. George Robinson, on which has this year been erected a commodious House, suitable for a highly-respectable family, and the Buildings and Premises arranged with every attention to comfort and convenience. A great portion of the Land has been drained and boned, and the whole that is required will be completed the ensuing winter. Immediate possession may be had of the House, Buildings, and Garden; and of the Land on the 2d of February next.

John Ennion, of Hatton Heath, near to the Turnpike, will show the Farms where the road branches to Tattenhall, will show the Farms, and particulars had of Mr. JOHN PALIN, Christleton, near Chester, or at the Office of JOHN PALIN & SON, Westminster Buildings, Newgate Street, Chester, where a Map of the Property may be seen, and offers in writing sent.

TO BE SOLD, WHITE CHINESE, OR SWAN GEESE, very handsome for ponds, and prolific and very early breeders.—Mr. P. DUTTON, Delamere Rectory, Chester.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

DRIED PLANTS FOR SALE.

TO BE SOLD, a very valuable and extensive GENERAL HERBARIUM, partly arranged, and included in six neat, well made deal cabinets, adapted for the foundation or nucleus of a botanical collection, and suitable for any Public Museum or private collector who is beginning the pursuit. It is the property of a gentleman who had expended much money upon it, but who, having left England altogether, is willing to dispose of it at a small price. To save trouble, the lowest price that will be taken is 35*l.* The Plants are all in the best possible state, and include many of those sent home by recent travellers and botanical collectors.—Apply (in the first place), by letter only, to Mr. PAMPLIN, 45, Frith Street, Soho Square, London

Sales by Auction.

ORCHIDS, STOVE, AND GREENHOUSE PLANTS.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 31st October, at 12 for 1 o'clock, a Collection of Orchids, including good Plants of Aerides roseum superbum, A. crispum, A. Odoratum purpureum, Vanda tricolor, Saccolabium retusium, S. Blumei major, Paphinia cristata, Trichopilia suavis, a new Cattleya, &c. Also a parcel from India, including many plants of Vanda Roxburghi; some imported plants from La Guayra, and 50 lots of Stove and Greenhouse Plants, many of which are fine specimens.—May be viewed on the morning of sale, and catalogues had.

RARE AND NEW PLANTS.

MR. J. STEVENS will include in the Sale at his Great Room, 38, King Street, Covent Garden, on TUESDAY, the 31st October, a consignment recently received from Mr. R. W. Plant, including six specimens of the very rare LODOICEA SECHELLAREM, or double Cocoa Nut of the Sechelles, in good condition; 6 specimens of the curious and remarkable plant STANGERIA PARADOXA; 7 specimens of a new species of Ansellia, and some other rare Orchids from the Zulu country, South Africa.—May be viewed on the morning of sale, and Catalogues had.

CAMELLIAS, RHODODENDRONS, AZALEAS, DEUTZIA GRACILIS, ETC.

A THIRD CONSIGNMENT FROM MR. JOS. BAUMAN, OF GHENT, FOR ABSOLUTE SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, Nov. 3, at 12 for 1 o'clock, 600 Camellias, 250 Deutzia Gracilis, 150 Kalmia Glauca, 250 new Hardy Ghent Rhododendrons, 200 Azalea Indica, 180 new ditto, 60 Yellow Rhododendrons, 25 Ghent Azaleas, 500 Gladiolus Gandavensis, and other Bulbs.—May be viewed the morning of Sale and Catalogues had.

TO GENTLEMEN, AMATEURS, FLORISTS, & OTHERS.

MR. J. WILLMER will submit by Auction, at the Mart, Bartholomew Lane, on WEDNESDAY, Nov. 8th, at 12 o'clock precisely, without reserve, a choice and valuable collection of TULIPS, comprising all the leading flowers of the day, the property of Mr. WILLMER, of Sunbury Nursery.—Catalogues at the Mart, and of the Auctioneer, Sunbury, Middlesex.

TO MARKET GARDENERS, NURSERYMEN, & OTHERS.

MR. W. T. ATWOOD will Sell by Auction, on the Ground, near the Church, Mortlake, Surrey, on TUESDAY, October 31, at 1 o'clock, about 4000 Roots of Linnæus and Mitchell's Royal Albert RHUBARB, four years of age, and in excellent condition for Forcing or Transplanting, and may be seen at any time till day of Sale at the enclosed site for the New Burial Ground, in the Wharple Way, near the Church, Mortlake. —Catalogues to be had at the office of the Auctioneer, Mortlake, Surrey.

BATTERSEA FIELDS.

To GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are directed by Mr. Fisher, to submit to an unreserved Sale by Auction, on the premises, Claremont Nursery, near the Duchess of York, Battersea Fields (on TUESDAY, November 7th, 1854) at Eleven o'clock, in consequence of the ground being required for the Battersea New Park, the whole of the valuable STOCK of EVERGREENS, consisting of very fine Arbor vitæ, Laurustinus, Hollies, Box Aucubas, Euonymus, Common Laurels, Fine Yews, Rhododendrons, Lilacs, Roses, Daphnes, &c. Also Fruit and Forest Trees, with a quantity of Box edging, &c.

May be viewed prior to the Sale.—Catalogues may be had on the premises, 21, New Street, Battersea Fields; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

CONSIGNMENT FROM GHENT FOR ABSOLUTE SALE.

MESSRS. PROTHEROE AND MORRIS are instructed by Mons. A. Van Geert, to Sell by Auction at the Mart, Bartholomew Lane, on FRIDAY, November 3, at 12 o'clock, 300 Double Camellias, 1 to 4 feet; and 200 Indian Azaleas, beautifully set with bloom buds; 250 Lilium Lancifolium Rubrum; 1000 Gladiolus Gandavensis; 50 Rhododendron Arboreum; with 8 magnificent Sweet Bays, &c. On view the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NOBLEMEN, GENTLEMEN, BUILDERS, & OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the administrators of the late Mr. Joseph Fairbairn, to Sell by Auction, on the premises, the Clapham Nurseries, on TUESDAY, November 14, and following days, at 11 o'clock each day, the whole of the valuable NURSERY STOCK, consisting of fine Evergreens, Ornamental Trees, and Deciduous Shrubs, of which particulars will appear in future advertisements.—May be viewed one week prior to the sale; Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

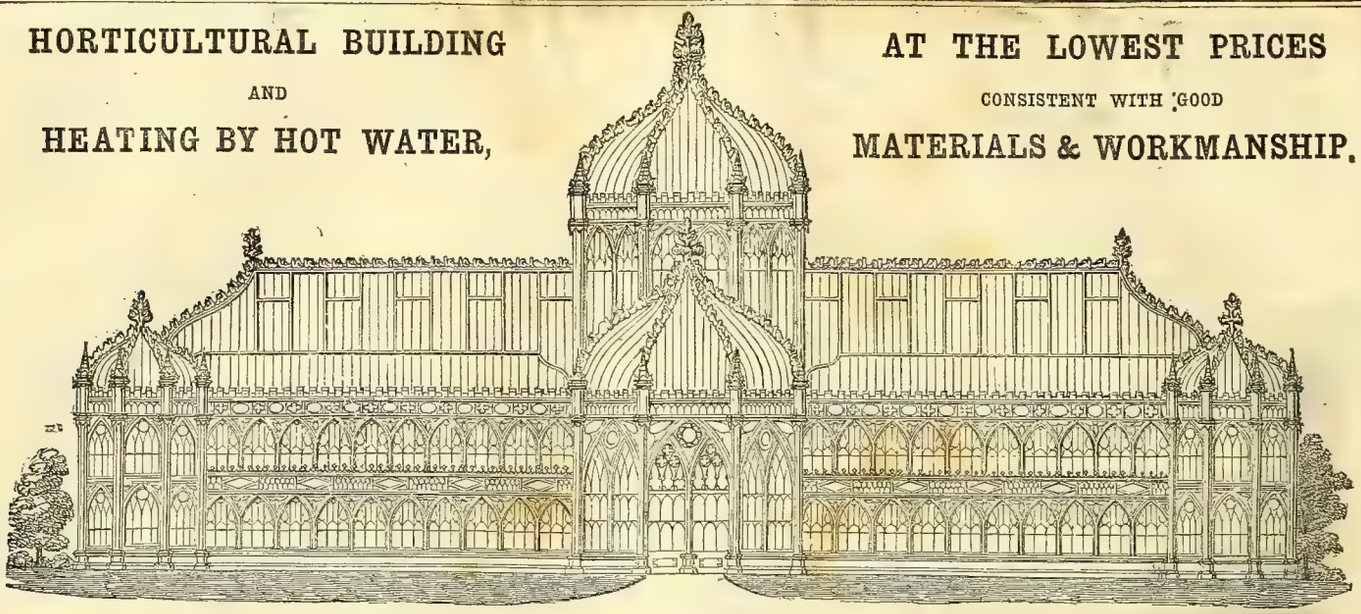
Watts, of Stoke Newington, to Sell by Auction, without reserve, on the premises, on MONDAY, October 30, and three following days at 11 o'clock each day, the whole of the valuable Nursery Stock, consisting of an immense quantity of American Plants, Ornamental and Fruit Trees, Evergreens, and Deciduous Shrubs, comprising 85,000 Rhododendrons, 5000 Ghent Azaleas. 2000 Limes, 1200 Thorns, 1000 Poplars, Planes, Elms, Laburnums, Chesnuts, &c., Standard and Dwarf Trained Peach, Nectarine, Apricot, Apple, Pear, Plum, Cherry, Gooseberries, and Currants; Standard Damsons; 1200 fine Mulberries, &c.; 5000 Arbor-vitæ, 6000 Hollies, 3 feet; 4000 Box, 7000 Aucubas, 3000 Euonymus, Perpetual and Common Laurels, Lilacs, Roses, Daphnes, Yucca Filamentosa, &c.; also Greenhouse Plants, including 200 fine Double Camellias, 50 very fine specimen Indian Azaleas, Heaths, Epacris, &c.; together with Greenhouses, 2 and 3-light Boxes, Gold and Silver Fish in Ponds, an excellent Horse, two capital Carts, Wheelbarrows, Garden Tools, a quantity of Box-edging, and sundry effects.—May be viewed one week prior to the Sale. Catalogues may be obtained (6*d.* each, returnable to purchasers) on the premises of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.



GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

FINE SPECIMEN PLANTS.

J. AND J. FRASER beg to invite attention to their magnificent Collection of large AZALEAS, HEATHS, and other Plants, which were never in such good condition as at the present time. This is an excellent opportunity for buyers as (on account of not having sufficient room) the plants will be offered at very low prices.

The Nursery, Lea Bridge Road, Essex.—Nov. 4.

WILLIAMS' EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON have been appointed Agents by Mr. Davis, of Malvern, for the sale of the above-named magnificent CLIMBING ROSE. Good established plants, 3*s.* 6*d.* each. Usual discount to the trade. For particulars purchasers are referred to their own and Mr. Davis' advertisements in *Gardeners' Chronicle* of October 7, page 643.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

CARNATIONS, PICOTEES, PANSIES, ETC.

JOHN SCHOFIELD AND SON have now ready strong plants of all the approved CARNATIONS, PICOTEES, PINKS, and PANSIES, as follows:—25 pair of Carnations and Picotees, 1*l.* 1*s.*; 25 pair of Pinks, 15*s.*; 25 Pansies, 1*l.* 1*s.* A Descriptive Catalogue of the above, &c., is ready; also a few packets of Pansy and Hollyhock Seed carefully selected from the finest sorts, 2*s.* 6*d.* per packet.—Knowsthorpe, near Leeds, Yorkshire.

DUTCH HYACINTHS, for Forcing, single and double, at 4*s.* per dozen. Also Narcissi, Crocuses, Tulips, Irises, Jonquils, Anemones, and Ranunculuses, priced Catalogues of which will be forwarded by post, from ARTHUR COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall.

Also Double Roman and Paper White Narcissus, the most beautiful and fragrant of all the Narcissi, 4*s.* per dozen.

BATH NURSERY AND SEED ESTABLISHMENT.

JAMES GRIFFIN begs to announce that his annual importation of Hyacinths and other Dutch Bulbs have arrived in excellent condition, and comprise all the best and most useful varieties.

J. G. has an immense stock of all the choicest kinds of Pinks, at 6*s.*, 9*s.*, and 12*s.* per dozen pairs.

Autirrhinum Seed saved from a first-rate collection, 1*s.* per packet.

Weston Road, and 2, New Bond Street, Bath.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

ROSE NURSERIES, HERTFORD.

E. P. FRANCIS' List of ROSES, containing all the new varieties worth cultivating, with a stock of 5000 dwarfs in 150 sorts, most successfully grown on the Manetti Stock, is now ready for delivery, and will be forwarded to any amateur, gratis, on application.

THE PLANTING SEASON.

WM. URQUHART AND SONS, Dundee, respectfully intimate that their PRICED LIST may now be had on application.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER'S descriptive List of the above splendid flowers, containing hints on their culture, and observations on exhibiting, &c., is now ready, and may be had on application, by forwarding one postage stamp.—Saffron Walden Nursery, November 4.

TULIPS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to inform the AMATEURS OF TULIPS that his CATALOGUE is ready, and will be forwarded by post on application. He is happy to say that from the superior growth of last spring, he has been enabled to make a considerable reduction in the prices.

HYACINTHS AND DUTCH BULBS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that he has received his HYACINTHS AND DUTCH BULBS, in excellent condition, and that they are much finer than usual. He begs to say he has a few bulbs of Calochortus luteus, and Lilium Thompsonianum still for sale.—His CATALOGUE of BULBS, &c., will be forwarded on application.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Baghshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

SAMUEL WALTERS, Helperton and Trowbridge Nurseries, Wilts, offers the following:—

ROSES, perpetual blooming, on 4 to 6-inch stems, clean, of unusual fine growth, well adapted for potting, to force, or to form beds at once. The following at 1s. each, or 9s. per dozen:—Baronne Hallez, Amandine, Jaune d'Arc, Madame Peppin, Madame Annie, Standard Marengo, La Reine, Reine des Fleurs, Robin Hood, Duchesse de Montpensier, Geant des Battailles Caroline de Sansal, Augustine Mouchelet, De Arnal, Baronne Privost, Lady Alice Peel, Duchess of Sutherland, Sedonie, Souvenir de la Malmaison, Mrs. Bosanquet, &c.

CHOICE CLIMBING ROSES 6s. per dozen.

HOLLYHOCKS at 1s. each, or 9s. per dozen:—Magnum Bonum, Mr. C. Baron, Spectabilis, Enchantress, Lady Braybrooke, Rosy Queen, Elegant, Comet, Ovid, Model of Perfection, Queen, Vivid, Conspicua, Rosa Alba, Bicolor, Obscura, Sulphurea, Perfecta, and Bella Donna:

Also New and Choice GERANIUMS 21s. per dozen.

FANCY GERANIUMS, 6s. to 9s. per dozen.

RARE CONIFERÆ.

ALEX. PONTEY, NURSERYMAN, Plymouth Nursery, Plymouth, begs to inform Gentlemen wishing to add to their Arboretums, that he can supply the following. Most of the kinds are planted in his Arboretum. He can warrant them hardy.

ALEX. PONTEY particularly calls attention to the THUJIOPSIS BOREALIS, which has proved quite hardy, and one of the grandest Coniferæ in cultivation. My specimen plants are now 3 feet high, and show their true character. Lists and prices will be forwarded on application.

N.B. A. P. can offer an extra-sized Libocedrus Chilensis about 6 feet high—splendid specimen.

All orders of 2l. and upwards are delivered carriage free to London, Hull, and Newcastle-on-Tyne, as well as to any Railway Station within 150 miles of the Nursery. Communications by Steamers and Railway to all parts of England, Ireland, and Scotland, as well as the Continent. Post-office orders to be made payable to YOUELL & Co.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

J. IVERY AND SON, NURSERYMEN, &c., Dorking and Reigate, Surrey, feel much pleasure in saying that plants of their two beautiful AZALEAS, CRITERION and ADMIRATION, may now be had from the undermentioned Nurserymen, true to name.

J. I. and SON wish to call attention to this list, as spurious varieties are offered:—

Barnes, Wm., Camberwell
*Bass & Brown, Sudbury
*Cattell, John, Westerham
*Cunningham & Fraser, Edinburgh
Dicksons, Messrs., Edinburgh
Dixon, E. P., Hull
*Epps, Jas., Maidstone
*Fisher & Holmes, Sheffield
Glendinning, R., Turnham Gn.
Henderson, Arthur & Co., Pine Apple Place
*Ivery, Wm., Peckham
*Jackman, George, Woking
Jackson & Son, Kingston
Lane & Son, Berkhampstead
*Lee, Chas. and Jas., Hammersmith
Low, Hugh & Co., Clapton
Meillez, M., Lille (France)
Parker, Robt., Hornsey Road
*Paul, A. & Son, Cheshunt
Perkins, E., Leamington
Rollisson, Wm. & Sons, Tooting
Turner, Chas., Slough
*Veitch, Jas., junr., Chelsea
*Walton, H., Edge End, Marsden
*Wood & Ingram, Huntingdon
Wood, Wm. & Son, Maresfield

Additional names to this list will appear in rotation as orders are received.

J. I. & SON also beg to say that plants of their fine hardy CRIMSON RHODODENDRON may be had from the above-named Nurserymen, marked (*), and also from the undermentioned:—

Bunyard, Jas. & Son, Maidstone
Cripps, Thos., Tunbridge Wells
Donald, Robt., Woking
Moore & Son, Birmingham

For particulars and description of this and the Azaleas, refer to *Gardeners' Chronicle* for September 16th, and two following weeks. A remittance or reference is respectfully requested from unknown correspondents.—Reigate, Nov. 4.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to recommend to the attention of Gentlemen and others engaged in Planting, the following plants from his general Stock, they are in fine healthy condition. The American Plants annually exhibited at the Royal Botanic Gardens, Regent's Park, are supplied from this establishment.

RHODODENDRONS.—The following is a selection of the most admired scarlet, rose, and high-coloured varieties in cultivation; are perfectly hardy, and bloom for the most part during the month of June.

Blandyanum, fine rosy crimson ... ... 5s. to 7s. 6d. each.
Lady Eleanor Cathcart, vermilion rose and dark crimson spots ... ... 21s. 0d. "
Lady Wenlock, bright crimson ... ... 21s. 0d. "
Atrosanguineum, dark scarlet... ... ... 10s. 6d. "
Alaric, dark purplish crimson ... ... 7s. 6d. "
Omer Pasha, dark crimson, new ... ... 10s. 6d. "
Juba, crimson, intensely marked ... ... 10s. 6d. "
Lefevreanum, crimson, tinged with purple ... ... 10s. 6d. "
Attila, dark crimson ... ... 7s. 6d. "
The Grand Arab, fine glowing crimson ... ... 7s. 6d. "
Brayanum, crimson ... ... 10s. 6d. "
Nobleanum bicolor, crimson, white eye ... ... 7s. 6d. "
Vandyke, light crimson... ... ... 10s. 6d. "
Blatteum, dark purplish red ... ... 7s. 6d. "
Rubens, light rose ... ... 10s. 6d. "
The Duke of Norfolk, clear rose, fine ... ... 10s. 6d. "
Celebrandum, dark crimson purple ... ... 10s. 6d. "
Rembrandt, fine crimson ... ... 10s. 6d. "
Congestum roseum, fine rose, well marked ... ... 21s. 0d. "
Roseum novum, clear rose ... ... 10s. 6d. "
Leopardi, rosy purple, and very much marked ... 5s. 0d. "
Floribundum coccineum, fine ... ... 10s. 6d. "
Erectum, good crimson ... ... 7s. 6d. "
Towardianum, large rose, fine... ... ... 10s. 6d. "

For planting extensively, no kinds of Rhododendrons are better calculated for a display than the varieties of the noble Catawbiense; they are all perfectly hardy, producing fine trusses of blooms of various hues—scarlet, rose, purple, white, and spotted white. The list below contains the leading kinds:—

Catawbiense, good bushy plants, 50s. to 63s. per 100.
" larger, 1½ to 2 feet, 12s. to 18s. per doz.
" seedlings, fine bushy plants, 12s., 18s. to 24s. per doz.

Catawbiense bicolor
" splendens
Album elegans
" grandiflorum
Cæleste
Cyaneum
Candidum
Delicatissimum
Egregium
Everestianum
Finibriatum
Mirandum
Lindsayanum
Gloriosum
Sherwoodianum
Bouquet de Flore
Melanthauma
Pictum
Roseum elegans
Victoria
Maculatum nigrum
" purpureum
Macranthum
Nivaticum
Perspicuum

Good strong well established bushy plants, 30s. to 42s. per doz. Larger plants can be supplied at a corresponding advance of price.

STANDARD RHODODENDRONS.—Of these, without doubt we possess the largest stock of really good kinds. Nothing can be more imposing when in bloom than a handsome standard. We have them 3 feet to 5 feet stems, and handsome symmetrical heads. The price of such would range from 42s. to 105s. each.

Rhododendron ponticum, good plants, 10s. 6d. per 100; larger, 1 to 1½ to 2 feet, 12s. 6d., 15s. to 25s. per 100. This is especially worthy the attention of planters; it will thrive in any soil, and in the most severe weather; is never injured by hares or rabbits. Unquestionably it is by far the best shrub for under cover.

KALMIA LATIFOLIA, good bushy plants, 60s. per 100; larger, 12s., 18s. to 24s. per dozen.

HARDY HEATHS, in 20 fine, named, varieties, many of them well suited to form edgings for larger clumps, 35s. to 42s. per 100.

HARDY AZALEAS.—A good assortment, if left to our selection, suitable for extensive planting, 1 to 1½ and 2 feet, 3l. 3s. per 100. The very best selected Ghent and other varieties, 18s. to 30s. per dozen. These produce flowers of all colours—scarlet, rich orange yellow, rose, and white.

STANDARD ROSES, of the most approved Perpetual and Bourbon varieties, 3 to 4½ feet stems, 18s. per dozen.

PINUS Douglasi, handsome seedling plants, 3 to 4 and 6 feet.
" insignis; we strongly recommend our stock of this justly admired Fir, all of which are from seed, 2 to 3, 4, & 5 ft.
" cembra, 3 to 4 and 5 feet.—Pinus excelsa, 3 to 6 feet.
" macrocarpa, 2 to 3 feet.
" Lambertiana, very handsome, 3 to 4 feet.

Araucaria imbricata, splendid formed specimens, 2 to 4 feet.
Cedrus deodara, of all heights, from 1 to 8 feet. We have a large quantity about 4 to 6 feet.
" Africana, 3 to 4 feet.
" Lebanon, handsome grown specimens, 3 to 6 feet.
Cryptomeria japonica, 3 to 12 ft.—Libocedrus chiliensis, 2 to 3 ft.
Fitzroya Patagonica, 2 feet.
Cupressus Goveniana, 3 to 4 feet.
" Lambertiana, 3 to 4 and 5 to 6 feet.
Irish Junipers, 4 to 5 feet.—Irish Yews, 4 to 8 feet.

The above-named Coniferous Plants have been frequently transplanted, are perfect specimens, and have never been grown in pots. Prices will be forwarded on application.

J. W. begs respectfully to solicit an inspection of his stock, from those who are engaged in planting. A Catalogue, containing full descriptions of his celebrated Collection of Rhododendrons, as exhibited by him at the Royal Botanic Gardens, Regent's Park, can be obtained by inclosing two Postage Stamps.

TO GENTLEMEN ENGAGED IN PLANTING.

JAMES GRAHAM, successor to Messrs. Silverlock and Son, respectfully invites attention to his stock of hardy Ornamental Trees and Shrubs, fine large transplanted Forest Trees, Trained Peaches, and Nectarines on walls, Apricots, Plums, Apples, Pears, Cherries, &c.; Figs, Gooseberries, Currants, Strawberries, &c.; Grape Vines from eyes, Archangel Mats, Mushroom Spawn, Dutch Bulbs and Seeds, improved Sion-house Cucumber Seed, 2s. per packet. N.B. Gardens and Pleasure Grounds laid out and planted.—Northgate Nursery, Chichester.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2d. stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

EARLY MONARCH RHUBARB.—The earliest and best variety ever offered to the public.

J. F. Wood, Esq., F.H.S., Editor of the "Midland Florist and Suburban Horticulturist," says—"I am highly delighted with the Early Monarch, and can confidently recommend it as the very best early Rhubarb grown. . . The foliage also is peculiar and very beautiful. . . For colour, size, and precocity, it is most assuredly worthy of very extensive cultivation; it is a decided acquisition."—Roots, 2s. 6d. each, or 24s. per dozen.

Also CRIMSON KING, very early, good size, fine flavour, and crimson colour, 5s. per root, or six for 24s.

Apply to Mr. JOHN BAILEY, Shooter's Hill, Longton, Staffordshire.

BARCHARD'S SEEDLING APPLE.—This beautiful Apple was raised from seed by Mr. Higgs, upwards of 20 years gardener to Mrs. Barchard, by whose kind permission he now begs to offer it to the Nobility and Gentry. It has been twice shown to Mr. Thompson, and also cut up at the Horticultural Society's Rooms, Regent Street, where it was highly approved of, and considered to be of first-rate quality; in proof of which Mr. Thompson's opinion of it is given:—

"BARCHARD'S SEEDLING.—Fruit received from Joseph Barchard, Esq., in whose garden it was raised, and fruited for the first time in the present season. Fruit middle size, roundish oblong, obtusely angular; eye rather deeply sunken, surrounded with projecting folds; stalk short, not deeply inserted; skin dark shining red next the sun, streaked towards the shaded side, which is of a pale orange tinge; flesh yellowish white, tender, with a rich brisk sugary flavour. This sort is worthy of cultivation.—ROBERT THOMPSON, Sept. 22, 1852."

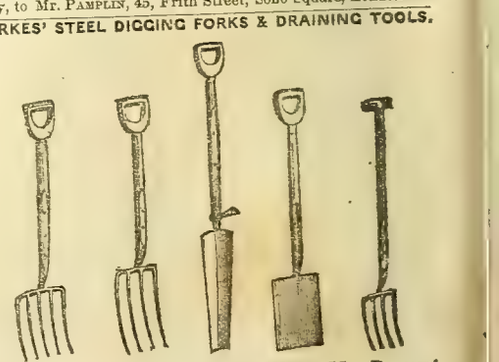
It is also described as first-rate quality in the Catalogue of New Fruit in the Horticultural Journal of October 1, 1853, vol. viii., where a full description of it is given. The whole of the stock is in the hands of Mr. Dancer, of the Fulham Nursery. Strong one-year old plants, 5s. each; extra strong plants, two years old, 7s. 6d. each.

All Post Office Orders directed to Mr. MATHEW HIGGS, Putney Heath, payable on the Putney Post Office, will be promptly attended to, and good strong plants immediately forwarded.

DRIED PLANTS FOR SALE.

TO BE SOLD, a very valuable and extensive GENERAL HERBARIUM, partly arranged, and included in six neat, well made deal cabinets, adapted for the foundation or nucleus of a botanical collection, and suitable for any Public Museum or private collector who is beginning the pursuit. It is the property of a gentleman who had expended much money upon it, but who, having left England altogether, is willing to dispose of it at a small price. To save trouble, the lowest price that will be taken is 35l. The Plants are all in the best possible state, and include many of those sent home by recent travellers and botanical collectors.—Apply (in the first place), by letter only, to Mr. PAMPLIN, 45, Frith Street, Soho Square, London

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

NEW CLIMBING HYBRID PERPETUAL ROSE, THE "DUCHESS OF NORFOLK."—Colour, Vivid Crimson. To be sent out for the first time about the end of October.

WILLIAM WOOD AND SON beg to refer to their advertisement in the *Gardeners' Chronicle* of September 30, page 627. Standards, half-standards, or dwarfs will be supplied at 10*s.* 6*d.* each, with the usual allowance to the trade.

N.B. When six plants or more are ordered by the trade, a very considerable reduction will be made beyond the usual discount, particulars of which may be had on application.

A Drawing of the above may be had for 6 Postage Stamps.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

GEORGE JACKMAN begs to announce that he has just published a new and complete CATALOGUE of his Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.

Woking Nursery, 1½ mile from Woking Station, South Western Railway, where all Trains stop, and where capital conveyances may be had.—November 4.

NICHOLSON STRAWBERRIES REDUCED IN PRICE.

WILLIAM NICHOLSON is now sending out strong well-rooted Plants of his four new and distinct Strawberries, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy; RUBY, ditto, a great bearer, and forces well; CAPTAIN COOK, market fruit, large, and a great bearer; FILLBASKET, ditto, 6*s.* per 100, box included. Most of the old and new sorts can be supplied.

*** See Mr. J. W. KINMONT'S remarks on the above Strawberries, printed in No. 31, 1854, page 501, of this Paper.

Post-office Orders, payable at Yarm, Yorkshire, or a cash remittance required with the order.

Egglescliffe, near Yarm, Oct. 28, 1854.

OMER PACHA STRAWBERRY.

WILLIAM JAMES WARD has still to spare a few more well-rooted plants of the above excellent Strawberry. Testimonials of the highest order. See advertisement in the *Gardeners' Chronicle*, August 26; also in the Descriptive List of New Fruits in the "Florist and Fruitist," Sept. Number, accompanied with a woodcut.

Prospect Hill, Reading. Nov 4. 1854.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50*s.*; 50, 30*s.*; and 25, 16*s.* Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5*s.* per 100.

Manor Farm, Deptford, November 4.

THE PERPETUAL TREE VIOLET, or DOUBLE VIOLA ARBOREA.—The original grower of this, the true variety of the above beautiful Violet, now offers it to the public; it has surpassed all others, and now stands without an equal for its size of flowers, fragrance, and perpetual blooming; and as a plant for the Conservatory or Greenhouse, nothing can equal it. Large plants, 6*s.* per dozen; smaller ditto, 3*s.*

DOUBLE WHITE TREE VIOLET.—This is also a fine variety, and resembles the other in many respects, with the exception of its colour. The stock of this is small, in consequence of the great demand for it last season; parties requiring plants should not delay their orders. 6*s.* per dozen.

THE RUSSIAN SUPERB VIOLET.—One of the finest of single Violets, large blooms, with long stems, and most delightful fragrance; will bloom well through the season if sheltered from the heavy rains and severe frosts during the dead of winter. Plants 3*s.* per dozen.

A TREATISE on the best and most effectual mode of cultivating the VIOLET, post free for 12 stamps, or sent gratis with all orders above 5*s.*

GIANT SCARLET BROMPTON STOCK plants are now ready for planting out; the spikes of flower are very large, (measuring from 18 to 24 inches in length) and so fragrant that they are admired by all who have seen them. Fine strong plants, 6*d.* per dozen, or 4*s.* per 100.

STRAWBERRY PLANTS.—Good strong plants of the following superb varieties can be supplied:—Nimrod, 10*s.* per 100; Prince of Wales, 10*s.* do.; Ajax, 5*s.* do.; Ruby, 5*s.*; Myatt's Eleanor, 3*s.* do.; British Queen (true), 3*s.* do.; Black Prince, 3*s.* do.; Cremont's Perpetual, 3*s.* do.; Victoria, 5*s.* do.; Surprize, 3*s.* do.; and a great number of other good old varieties, at 3*s.* per 100.

POLYANTHUS SEED, saved from the best laced varieties, 1*s.* per packet.

ANTIRRHINUM SEED, all saved from the best named varieties, 1*s.* per packet.

EXTRA FINE SWEET WILLIAM SEED, saved from all the best and most beautiful varieties, 1*s.* per packet.

VERY SUPERIOR WELL RIPENED HOLLYHOCK SEED, 1*s.* per packet.

LORD KEYNON'S FAVOURITE CUCUMBER is the best and most productive for winter cultivation ever grown, requiring less heat than any other of the kind. It is a very handsome fruit and free setter. Good old seed of the above true variety may be had, price 2*s.* 6*d.* per packet.

The Violets and Seeds will be sent postage free, but the Strawberry Plants and Stocks will be sent by hamper, package free.

Any of the above will be forwarded on receipt of Post Office Order, or Penny Postage Stamps, for the amount by

EDWARD TILEY, Nurseryman, Seedsman, & Florist,
14, Abbey Churchyard, Bath, Somersetshire.

TO THE AGRICULTURISTS OF ENGLAND.

HARRADINE'S "NE PLUS ULTRA" WHEAT.—A single ear of this wonderful Wheat, which was purchased five years ago of a soldier on tramp, who brought it from some distant country, was sown in 1849; the produce of this was again sown in 1850, and also in 1851, when it yielded at the rate of 19 coombs, 1 bushel, and 1 peck per acre. This induced me to continue its cultivation. A sheaf and a quantity of corn will be shown on Messrs. Garratts' Stand in the Agricultural Department of the Crystal Palace, by which its quality and general character may be seen.

The following Gentlemen kindly lent me portions of their land last season, to test the producing quality of the Wheat, and up to this year not one kernel has been sold for seed. The quantity sown on all the varieties of soil has in no instance exceeded 4 pecks per acre. On land of Mr. Wasdale, in the parish of Woodhurst, this Wheat was sown after Tartarian Oats, Clover, Seeds, Peas, and Tares (some being sown in February, and equally productive). On land in the occupation of Mr. Gadsby, in the parish of Godmanchester, 1 acre, the yield of which has been 30 per cent. over his own Wheat, grown in the same field, and has been tested by several Agriculturists in the neighbourhood. On land in my own possession, in Needingworth and other places (both Fen and Highland), it has been sown after Wheat, Clover, Barley, Beans, Oats, and Fallow, and in every instance has been most productive.

I am prepared to part with a limited quantity, which can be had on application to me, at 25*s.* a bushel. All orders to be accompanied by a remittance.

JOHN THANG HARRADINE, Needingworth, St. Ives, Huntingdonshire.

CRIMSON PERFECTION RHUBARB.

ROBERT SALT, of Longton, Staffordshire, begs to inform the Gentry and Nurserymen that this splendid variety of Rhubarb is now ready for distribution, and shall feel happy to serve parties who may favour him with their orders.

R. S. begs to state that it is the most splendid, early, and prolific variety ever offered to the public. Orders addressed to ROBERT SALT, Longton; Messrs. Hurst and M'Mullen, 6, Leadenhall Street, London; Messrs. Burgess and Kent, Penkhull; Messrs. Francis and Arthur Dickson, Eastgate Street, Chester; Mr. Wood, Nurseryman, Nottingham, will have immediate attention. Price 7*s.* 6*d.* per root, three for one guinea, and six for 2*l.* A liberal discount allowed to the Trade. A Post-office Order from unknown correspondents.

THE LARGEST AND CHEAPEST ESTABLISHMENT IN ENGLAND for GERANIUMS (show and fancy), FRENCH GERANIUMS, FUCHSIAS, VERBENAS, FAIRY ROSES, CHRYSANTHEMUMS, HELIOTROPES, CINERARIAS, CALCEOLARIAS, PRIMULAS, and other soft-wooded plants, is the Floral Nursery, Acton Road, Turnham Green, near London. More than 250,000 plants are there cultivated annually.

For further particulars, see Advertisement in last week's *Chronicle*. Catalogues forwarded to all parts gratis.

Every possible exertion will be made to give the most perfect satisfaction to all who may favour this Establishment with their patronage. None but thoroughly established Plants will be sent out, and full reliance may be placed on prompt attention and fair dealing.

The Trade will be liberally dealt with. Provincial Nurserymen and Florists will do well to try this Establishment.

Terms cash or a satisfactory reference.

JOHN WESTWOOD, PROPRIETOR.

SUPERB DOUBLE HOLLYHOCKS.

JOSEPH BUTLER, Gardener to R. Hills, Esq., Colne Park, near Halstead, Essex, begs to announce that he has now ready for sending out a large stock of extra strong plants of nearly all the varieties yet sent out; also some superb new varieties of J. B.'s own raising.—Descriptive Catalogues will be sent post free on the receipt of a postage stamp; also Seed saved from J. B.'s superb collection; 150 Seeds mixed for 12 postage stamps. Collections, consisting of well contrasting colours, at 6*s.*, 10*s.*, 15*s.*, and 25*s.* per dozen; if left to J. B.'s own selection good double contrasting colours for Borders, not named, 4*s.* per dozen. A remittance is solicited from unknown correspondents. Post Office orders, payable at Halstead, Essex.

DOWLING'S NEW PLUMS.—These admirable varieties were raised by Mr. Henry Dowling, Woolston Laune, near Southampton, and are again offered for sale, viz.:—

ANGELINA BURDETT PLUM, each	...	...	...	5*s.*
BLACK GAGE	„	...	...	5
STANDARD OF ENGLAND	„	...	...	5

These varieties are particularly recommended for productiveness and excellent flavour, producing an abundance of fruit in a dwarf state in the open ground. Strong Dwarf and Standard Plants now ready at Woolston Laune, or Mr. CHARLES TURNER'S, Royal Nursery, Slough, near Windsor.

N.B. A very great reduction to the trade by taking 6 or 12 of each. Terms on application.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, begs to announce that the following New Plants are now ready for sending out by them, viz.:—

HELIOTROPIUM "BEAUTY OF THE BOUDOIR."
CHRYSANTHEMUM "ANNIE HENDERSON."
GERANIUM "PRETTY POLLY," hybrid bedding variety.
ACHIMENES HENDERSONII.

FANCY GERANIUMS.

Cloth of Silver | Evening Star | Crystal Beauty

CINERARIAS.

Mrs. Rogers | Fascination
Mrs. Gerard Leigh | Prince of Prussia

And the New RHODODENDRONS of Assam and Bhootan.

Full particulars of the above will be seen on reference to their Autumn Catalogue, just published, which will be forwarded post free on application.—November 4.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Their new descriptive Fruit Catalogues, Ornamental Trees and Shrubs, American Plants, choice Rhododendrons, Roses, &c., can be had on application.

Pine-apple Place, Edgeware Road, London.

TO THE SEED TRADE.

BEAUTIFUL NEW CALIFORNIAN ANNUALS.

MESSRS. VEITCH AND SON are now prepared to supply SEEDS of the following recent introductions which were sent them by Mr. Wm. Lobb, and are at present solely in their own possession. They are certainly three lovely additions to our hardy Annuals, and cannot fail to give general satisfaction.

ESCHOLTZIA TENUIFOLIA.

This lovely dwarf Annual is peculiarly adapted for forming masses, or for Edgings to beds. It is of a delicate clear straw colour, of neat compact habit, about 9 inches in height; its foliage being small and producing its flowers in abundance at the same time, renders it very attractive.

It was exhibited at the last July Chiswick Show, and had the FIRST CLASS CERTIFICATE awarded it.

Dr. Lindley in the report of this show, in the *Gardeners' Chronicle*, of July 15th, describes it as—"The charming Esch. tenuifolia, quite different from the old species, dwarfer and neater."

It is figured in Curtis's "Botanical Magazine," Oct. 1854.

LEPTOSIPHON AUREUM.

This very pretty little plant is of a BRIGHT GOLDEN COLOUR, dwarf compact habit, is VERY SHOWY, and has a BEAUTIFUL EFFECT in small beds.

It is also well adapted for growing in pots or boxes for GREENHOUSE DECORATION.

It is a Californian species, and is altogether distinct and VERY SUPERIOR to Leptosiphon luteum.

WHITLAVIA GRANDIFLORA.

This very fine thing has LARGE DARK VIOLET bell-shaped flowers, which are produced in abundance.

It is figured in the October number of Curtis's "Botanical Magazine," and the following is what Sir William Hooker says of it:—

"This BEAUTIFUL ANNUAL has ATTRACTED the ATTENTION of ALL LOVERS of Horticulture at the Chiswick Exhibitions of the present summer (1854), having been sent by the Messrs. Veitch, from their Nurseries at Exeter, and King's Road, Chelsea. The seeds had been the year before sent home from California by Mr. William Lobb.

Dr. Lindley, in his notices of new plants in the *Gardeners' Chronicle*, of Oct. 21, describes it "AS THE GEM OF THE SEASON IN THE CLASS OF HARDY ANNUALS."

It was exhibited at Chiswick in July last, and had a first class Certificate awarded it.

Prices of the above will be forwarded to the trade on application.

Nurseries, Exeter and Chelsea, Nov. 4.

CHATERS' SEEDLING PANSY, PICOTEE.

J. CHATER AND SON beg to announce that they intend sending out after the 20th October, their SEEDLING PANSY named PICOTEE, in strong plants, 5*s.* each. Pure white ground, beautifully edged with azure blue; eye large, fine form and substance. The margin of this flower resembles a fine Picotee.

Also Hollyhock Seed, from the best sorts, in packets containing 200 Seeds, 1*s.* 6*d.*; 400 Seeds, 2*s.* 6*d.*

Fine Plants of splendid Sweetwilliam, 1*s.* 6*d.* per dozen; 10*s.* per 100.

Choice Pansy Seed, 1*s.* to 2*s.* 6*d.* per packet.

A catalogue of the best Hollyhocks, Pansies, Roses, and Pinks, can be had on application to J. CHATER & SON, Nurseries, Haverhill, Suffolk.

JOHN CATTELL, Westerham, Kent, begs to inform the public that his Descriptive Priced CATALOGUES of his extensive collection of NURSERY STOCK for the current season, are now ready, and may be had on application, enclosing a penny stamp for each, excepting Catalogue No. 10, which will require two penny stamps.

CATALOGUE No. 6.—GRAPE VINES, STRAWBERRIES, RASPBERRIES, &c.
„ No. 8.—ROSES.
„ No. 9.—FRUIT TREES.
„ No. 10.—HARDY ORNAMENTAL TREES AND SHRUBS, CONIFERÆ, AMERICAN PLANTS, CLIMBERS, &c.
„ No. 11.—FOREST TREES, &c.

The Gardeners' Chronicle.

MONDAY, NOVEMBER 4, 1854.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Nov. 7—Horticultural ..... 2 P.M.

IT may be as well to remind our readers that the next meeting of the Horticultural Society will be held next Tuesday, in Regent Street, at 2 o'clock. Subjects of exhibition must be delivered not later than 11 A.M.

MR. THOMAS WICKSTEED, in his report to the Metropolitan Commissioners of Sewers, makes the following statement respecting one of the schemes for saving the sewage water of the metropolis for manure. "The main pipage required will be equal to 1236 miles, varying in diameter from 38 inches to 12 inches. The steam power required will be equal to 16,152 horses, working under a pressure equal to a column of water of 500 feet. The capital required will amount to nearly 12,000,000*l.* sterling. The quantity of coals required per annum will be about 170,000 tons. The annual cost for coals, labour, stores, and repairs for engines and buildings will amount to 240,000*l.* sterling." This he thinks enough to show that the liquid scheme, even if it could be carried out as proposed, is not feasible. Moreover, "when, in addition to what has been stated, it is borne in mind that the basis upon which the calculation rests is upon the assumption first that the whole of the sewage water could be collected into one central spot; secondly, that 12 38-inch radial pipes could be laid in straight lines from this central point; thirdly, that the circle of 66½ miles in diameter round the metropolis is a flat plain, and that the Surrey hills on the south, and the Middlesex and Hertfordshire Hills on the North, do not exist; fourthly, that a sufficient number of landed proprietors could be found within the proposed extent of district to use so large a quantity of one kind of manure; and as the supply must be constant, to construct covered reservoirs on their lands to hold the supply during such periods as it is not being actually poured upon the land; and unless these to me impossible conditions can be complied with, the estimate for 12,000,000*l.* will be found much too small;—I think the Commissioners will agree with me that such a scheme for the disposal of the sewage water of the metropolis should not be entertained." We venture to think that the projector who does not agree with Mr. WICKSTEED must be very mad indeed.

Mr. WICKSTEED is, however, one of those who think that sewage may be solidified by means of lime; the supernatant fluid, which would be pure, being run off. But when we find that the utmost value which he can himself place upon the solid residuum is 2*l.*, or 2*l.* 2*s.* a ton, we should greatly doubt the wisdom of entering into such a speculation as he advocates.

For ourselves we entertain the conviction that London sewage can never be removed except through the Thames; that it is too worthless a material to afford any adequate return for the cost to be incurred either in purifying, or solidifying, or wasting it. The cost of removal must be defrayed out of rates; and if it is resolved that the Thames shall cease to be a common open sewer for the metropolis, then the sewage must be directed, when it reaches the river, into two main covered aqueducts or culverts, built close inshore along either bank, and carried as far towards the sea as may be expedient; if carried to the Nore, so much the better. People living on the banks of the river might intercept the sewage and apply it to their land if so disposed. Quays might be constructed over the huge culverts so as to conceal them, and

those quays might form admirable wharves where wanted. Blackwall exemplifies our meaning. Where the culverts passed the mouths of docks and similar inlets, some means must be taken to carry the sewage downwards; but difficulties of such a kind would scarcely impede the operations of our modern engineers. The cost of such a scheme would of course be considerable; but not greater than could be defrayed by a small rate levied upon the whole metropolitan district.

In another part of to-day's columns will be found an allusion to the wonderful beauty of a plant called Gynerium argenteum now growing in the garden of the Horticultural Society. This glorious plant is still so little known that it seems desirable to bring it more prominently into notice than has hitherto been done.

In the first volume of Paxton's "Flower Garden" it was spoken of in the following manner:—

"This noble plant, now called the Pampas Grass, in consequence of its inhabiting the vast plains of South America so named, has been introduced within a few years through Mr. Moore, of the Glasnevin Botanic Garden. Although but a Grass, it will probably form one of the most useful objects of garden decoration obtained for many years. In stature it rivals the Bamboo, being described as growing in its native plains several times as high as a man. The leaves are hard, wiry, very rough at the edge, not half an inch broad at the widest part, of a dull grey-green colour, much paler below. They are edged by sharp points or teeth, little less hard than the teeth of a file. The flowers appear in panicles from 1½ to 2½ ft. long, resembling those of the common reed, but of a silvery whiteness, owing to their being covered with long colourless hairs, and themselves consisting of colourless membranous glumes and pales."

To this we have little to add, but that little is important. It is now ascertained beyond all doubt that no amount of frost experienced near London, even although associated with incessant rain, in any degree affects the health of the plant. The specimen in the garden of the Horticultural Society has acquired the following dimensions:—

Height from ground to curve of leaves ...	7 ft.
„ to summit of the plume of flowers ...	11 ft.
Diameter of the tussock	9 ft.
Length of one of the leaves	8 ft.
Number of flower plumes	17
Length of do.	2 ft.

Let the reader conceive such to be the magnitude of one single individual of a reedy grass, whose grey hard narrow leaves curve most gracefully from the centre to the circumference, forming a thin but huge tuft; add to this many slender flower-stems darting into the air, and gracefully poising on their summits a white airy mass of light scales, whose polished surface can only be rivalled by the delicate work of the silversmith; place this a little above the eye among rocky ground, let it be well backed up by some dark foliage, and a faint idea may be formed of the general appearance of the Pampas Grass. Or the annexed cut, representing a young plant, before the form of the tussock was established, may be used as an aid to the imagination.

We believe that the oldest specimen near London is that in the garden of Robert Hutton, Esq., of Putney Park; the next is what our reporter mentions in the collection of the Horticultural Society. At present the plant is very rare; all or nearly all those which we have heard of deriving their origin from a common source, the Glasnevin Botanic Garden, near Dublin, whence they have been liberally given away. No certain means of propagating it has yet been discovered, though we presume that might be effected by tearing to pieces a large tussock; a process to which the fortunate possessors of the plant not unnaturally demur. It is therefore clear that we must look to its seeds, if the plant is to become common, as it should be. But it flowers so late in England that we are not likely to save seeds ourselves, and must trust to its native stations and the activity of travellers.

But here is another difficulty. We are unable to say with certainty where the species grows wild. The Prussian botanist Sellow is reported by Nees v. Esenbeck to have found it at Monte Video, and we know that vast tracts (Pampas) near that city, and in all the adjoining country, are covered with what is familiarly called Pampas Grass. But we have no certainty that the name is applied to one large Grass only, and that our Gynerium is that one. It may be, and probably is, a collective term, including various species; at any rate, Sir Francis Head speaks of the "plain of brown Grass" on the Pampas, which is by no means applicable to a plain of Gynerium. In Miers' travels we have failed to trace it; but in truth writers of books of travel so invariably eschew an index that their works are useless to any except men of great leisure. Dr. Hooker's "Himalayan Journal" is the greatest exception we can call to mind; and a most honourable exception it is. That the Argentine provinces really produce the plant we do not doubt: but we have no means of indicating its whereabouts.

According to the same authority as that already quoted, Dr. Von Martius collected Gynerium argenteum near Rio Janeiro, and in the province of St. Paul. But we have no locality given; it is not a little remarkable that Gardner, who must have been struck by the beauty of so remarkable a plant, is silent as to its existence; the only expression that we can find having a possible allusion to its existence is a statement that "large Grasses" grow on the Corcovado, a well-known mountain at the back of Rio.

In this uncertainty we invite information from all who have any acquaintance with Monte Video or Brazil; for if a precise station can be given in either of these countries, we entertain no doubt that commercial enterprise will soon secure the seed in abundance.

We regret to announce the death, on the 27th inst., in Cornwall Street, Plymouth, of Mr. John Pontey, nurseryman, aged 91 years. The Plymouth Nursery, in King Street, originated with him, and owes its reputation to his perseverance, skill, and enterprise. He leaves behind a feeling of universal regret for the departure of a sincere Christian and truly worthy man.

VEGETABLE PATHOLOGY.—No. XLIV.

195. What is Disease, within the Meaning of the term as used in general by Cultivators? Those readers who have carefully followed up the several particulars relative to the healthy condition of vegetables, which it has been considered necessary to bring forward with a view to show more clearly those changes of structure or condition which are to be included under the denomination of disease, will have already gathered many particulars by the way, both as regards facts and principles, and will in some measure perceive in what cases remedies are hopeless, and in what there may be some prospect of modifying disease where it cannot be wholly removed. It is, however, of great importance, before we consider the diseases themselves to which the vegetable world is subject, that we should first have a clear notion what is meant by disease, for the term is not altogether of precisely the same latitude as when used in the science of medicine. In both cases, indeed, some ideal standard is assumed of healthy condition, and every departure from that standard is regarded as morbid; but in either case the normal standard is not the same.

196. The objects of cultivation, except as regards mere botanical species, are seldom in precisely the same conditions as those under which they occur in free nature. The parts which render them worthy of attention, are sometimes the leaves, sometimes the seeds or fruit, sometimes the bulbs or tubers, and sometimes the young stems; and in almost every case, the tendency of cultivation and the main object which the cultivator has in view, is the abnormal increase of those parts, and at the same time a proportional diminution of others less useful, so far, at least, as such a decrease may be consistent with the main end. In many instances the point is to encourage the development of cellular tissue in some particular part; but in most, at the same time, there is a concurrent end, viz., the increase of the peculiar matters, whether starch, sugar, pectine, &c., which the cells are calculated to contain. Sometimes, as in the case of Lettuce, Celery, or Asparagus, and, indeed, wherever exclusion of light is the proper mean, the efforts of cultivation are in a precisely contrary direction; but more generally, as in culinary roots and tubers and the various kinds of fruit and grain, the point is to increase the nutritive matter as much as possible which the several organs naturally tend to produce, while any peculiar secretions are proportionally diminished. Now it is clear that though these productions of agricultural or horticultural skill are unnatural, they cannot be regarded in the light of disease by the cultivator. To produce these conditions and to improve and increase them as much as possible is the grand point to which his skill is directed, and therefore whatever has a tendency to keep them in check and to reduce them to their natural condition is looked upon as calamitous. A striking instance of what is meant may be derived from consideration of our great agricultural shows. The animals which are there exhibited, so fat that they can scarcely walk, and any moderate exertion would be dangerous if not fatal, are the great objects of admiration and of reward, the main point being to produce a breed which within the shortest time shall produce the greatest weight. Such a condition is in reality one of disease, and which in man would justly be so considered and deplored as highly

disastrous; and yet the farmer, so far from regarding it as calamitous, prides himself in any approach to such monstrous developments, because they are the source of profit.

197. While, however, cultivation has a marked tendency to increase nutritious matters, whether available for the general purposes of vegetation or applicable to the wants of man, in most cases it has a contrary effect as regards the peculiar secretion which particular plants produce, and whose utility to the plants themselves is either obscure or wholly unknown. It is, for instance, a matter well known to those who prepare extracts for the purposes of medicine, that a far larger proportion can be prepared from an equal weight of the wild plants than can from the same plant under cultivation. The cultivator may indeed, as in the case of the Hop, effect the production of more frequent catkins, and improve these by the multiplication of the bracts of which they are composed, and consequently of the quantity of lupuline; and in like manner he will obtain larger spikes, and in consequence an increased production of oil from cultivated Lavender; but where especial organs are not concerned, and the secretion is diffused through the plant, the quantity, and frequently the quality, derived from the cultivated plant will be impaired. In some cases, as in Rhubarb, let the root be increased in size as much as it may by artificial means, the produce will never be equal to that of the wild plant. In these instances, therefore, the tendency of cultivation is to produce an abnormal condition, equally with the former; but inasmuch as no great difference is apparent in the external organs, and vital action is not palpably impaired, though the purposes of cultivation are not completely fulfilled, in our ignorance of the part which these peculiar secretions perform in the general economy, such conditions, if indicative of disease at all, can scarcely be regarded as presenting more than a very feeble type. *M. J. B.*

PROFITS OF PEAR-GROWING.

In a letter inserted in the *Gardeners' Chronicle*, p. 678, your correspondent, "H. T. H., Staplehurst," states that the produce of the Pear tree is of less value than that of the small-fruit tree, and that he would feel obliged by receiving instructions which might be the means of increasing the produce of his Pear trees. Your correspondent cannot be serious in his request. He should have made known the condition of the soil in which the trees are planted, the names of the varieties which he cultivates, probably shy bearers, their age, and system by which they are managed. Without information on these points it is impossible to give him a satisfactory answer. Nevertheless, I may say that if his trees are reared according to the system adopted near London, it would be impossible to give him advice on the subject with any prospect of success. In fact, in our opinion, the fruit trees there are too far gone, and, as it appears to me, they can never afford a produce proportionate to the expense incurred in their cultivation. The grounds on which this opinion is based have been already detailed in a previous communication, and therefore it is not necessary to go over them again.

It is upon the choice of the soil, or, it may be, in plantations of this kind, upon that of a variety sufficiently hardy and vigorous to succeed as a standard; and also upon the choice of a healthy and vigorous stock, reared upon good principles, and subjected to a proper system of pruning, the essential points of which were laid down in a communication last month, that the future success of a plantation of dwarf or tall pyramid Pear trees depends.

In its youth, a Pear tree is subjected to a careful and scientific mode of pruning, the object of which is to preserve the stem straight and upright, the branches at proper distances, and to form a good skeleton. When the tree has arrived at the age of bearing fruit, less pruning is required; and is then confined to regulating the distances of the branches along the stem, and cutting back the shoots to a good eye. These operations are neither difficult nor expensive when the workman is once accustomed to them. In a working day he may easily go over fifty trees.

With regard to the value of produce of a pyramid, treated according to these principles, we shall give an example (taken from among several trees). The very vigorous and fruitful variety of Pear tree, called Triomphe de Jodoigne, raised by the late M. Bouvier, a pupil of Van Mons, occupies in my garden a space of 8 feet square. The tree is from eight to nine years old. For the first four years after planting, the pruning was conducted with the view of forming the branches of the pyramid; and after that period it was performed with the intention of bringing the young tree into a fruiting state.

The first fruits were produced to the number of 15, in 1853. This year the tree has borne 58 fruits, equal in size to the Catillac, but of a longer and more handsome form. In the beginning of May, I judged it advisable to remove from the tree upwards of 200 well-formed young fruits, in order that the remainder might attain their full degree of excellence.

After gathering them, in order to ascertain what this new fruit would fetch in the Brussels market, I gave 10 of the fruit, together with its name, to a fruiterer, who immediately found a purchaser for them at the rate of 50 centimes (about 4½*d.*) a piece. Hence it appears, that a pyramid planted 8 years, and occupying a space of not more than 8 feet square, yields a produce, the value of which is upwards of 1*l.* sterling. Let us suppose that four pyramids occupy a space of 20 feet square, the rent of which, at the utmost, would not exceed 2*s.* a year; and after having been planted and well cultivated for 8 or 10 years, produce altogether 200 fruits, and sell to the fruiterer for 10 centimes (about 1*d.* each), which is the lowest price for a good Pear in the most favourable years; then this produce, of 20 feet square, would be worth about 1*l.*, which would be equal to 400*l.* per hectare (about 161*l.* per acre). Truly, I know of no other product of the earth which will yield this sum.

It is, of course, understood that table fruits are not here sold by measure, or by the sack, like stewing or baking Pears. To obtain the above result, the most hardy and productive varieties must be chosen, and trained according to the best principles.

Now, that neither your correspondent nor the reader may have any doubt respecting the truth of these statements, I take the liberty of saying that I might adduce the testimony of several celebrated horticulturists in your country, Messrs. Veitch and Son, G. Henderson, Standish, Rivers, jun., my friends Booth, of Hamburgh, Hartweg of Weimar, and many other visitors, who may perhaps read these lines.

In conclusion, I invite all English amateurs who may come to Brussels to spend an hour in visiting my gardens, where they will find proof as regards the application of the principles which have formed the subject of our communications. Judging from appearances, which are very fine, the results will be every year more conclusive. Besides, as the system has produced such good results in a climate and soil which much resemble those of England, it appears to me that a trial of it might be made at Staplehurst. If, after experiments made with care and perseverance, *H. T. H.* find that my directions are bad, then he will have a right to say that they have been of no benefit to him.

Mr. *H. T. H.* cites 30 years' experience in the cultivation of fruit trees. In this respect I am his senior, for I planted my first trees more than 40 years ago. By the aid of the formulæ of science, which sum up the experience of ages past, and by reading constantly the phenomena of lovely and bounteous Nature, we get more and more enlightened as to the means of obtaining the greatest amount of her benefits. *De Jonghe, Rue des Visitandines, Brussels, October* 22.

DELAMERE FOREST AND THE CHOPWELL WOODS.

It appears from recent reports and from blue books, that several persons who are supposed to be competent to give the best information on the subject, have been called on to give their opinions on the present condition and future prospects of Delamere Forest, and that those gentlemen most recently appealed to in the matter assert that it is, or at least the far greater portion of it, totally unsuitable for the growth of Oak timber; and some of them affirm that 20 years hence the present crop of Oak will be either dead or in a very advanced stage of decay, an opinion in which they are confirmed by Mr. Lipscombe's statement that he cannot make Oaks grow higher than a table, for when they attain that height they obstinately refuse to get higher, but bend weepingly their umbrella-like heads to the ground.

Now, with all due deference to the experience of Mr. Lipscombe and that of the gentlemen who have been appealed to on the subject, I must be permitted to state that I disagree entirely with their conclusions. I know a good deal about Delamere Forest, having of late been frequently in most parts of it, and a witness of the extremely bad management carried on in it, and indeed so much have I seen that I disapproved of, that I have been unable to refrain (even at the risk of being considered very officious) from drawing the serious attention of many of the late commissioners to the deplorable state into which the forest had fallen from mismanagement, and to the large sums of money which have been wastefully and recklessly squandered in persisting to plant fresh plants under the drip and shade of other trees, where it was literally impossible they could make any progress.

It is not, however, altogether improbable that some of the gentlemen who assert that the forest is unfit for the production of Oak timber may have a longing desire to try their own "luck," or that of some of their friends in the art of growing timber for profitable purposes, provided the Government could only be induced (after having given it a bad character) to dispose of it at a cheap rate, in order to get readily quit of so bad a bargain. In fact, I have been credibly informed that 50*l.* an acre has been offered for it, which of course I suppose included the present crop of so-called stunted and worthless timber that is growing upon it; and at so trifling a sum, it certainly would be a good bargain to whomsoever might invest capital in its purchase.

Had the former and late Commissioners of Woods followed my recommendations and practice, so often tendered to them, they would have escaped the universal public reprobation they have so justly merited by the ruin of the Chopwell Woods and the Forest of Delamere in particular; the credit of their forest management would have been maintained, and a very large amount of the public monies would have been saved to the nation. But no!—my advice and examples of good management were despised; and, what was the "unkindest cut of all," one of the latest of the Commissioners, Lord Seymour even threatened to withraw my poor pension, so angry was he with me for my officiousness in having tendered, by his previous permission, honest advice and important information for the better future management of the department under his control.

But to come to the point, my present object in writing is publicly to deny that the greater part of the forest in question is unfit for the growth of Oak timber. It is said that nine-tenths are unsuitable for that purpose; consequently, according to that report, a very small portion of it should have been planted with Oaks. I have been employed this last summer by Randle Wilbraham, Esq., of Rode Heath, Lawton, Cheshire, to instruct some young woodmen in my system of training forest trees in young plantations and in hedgerows on his estate near Delamere Forest; and also at Lord Skelmersdale's, at Lathom, near Ormskirk, Lancashire, and therefore I know what can and cannot be effected in that forest. By my system of training I mean a preventive system of pruning, or no pruning at all, provided the training is commenced, as it always should be, at the earliest stages of growth; and I publicly challenge any person who has any just pretensions to a practical knowledge of arboriculture to deny or refute the good effects I have produced on stunted umbrella-headed trees, on land as unfit for the production of Oak as it is reported Delamere is. Upon what I have achieved by means of my system I am willing to stake my reputation as a forester. Its good effects may be seen and proved in a small plantation belonging to Mr. Wilbraham on Duddon Heath, within three miles of the forest, adjoining the road from Tarporley to Tarvin. My son, of the grammar school at Tarvin, could point them out. Stunted trees which have only been three years under my care, now (October), exhibit most luxuriant shoots, dark, glossy leaves, and healthy, shining bark, and are from twelve to eighteen feet in height, with proportionate strength of stem, on land equally poor and sandy as Delamere Forest. Such trees contrast strangely with the miserably unhealthy stunted growth of those of a great part of the forest plantations, which are at least double the age of my specimens. In an older plantation near this, on the other side of the road, there are fine Oaks of about 50 years' growth, which show no signs of decay or deterioration, on land as sandy, heathy, and poor as that just described. There are the trees and the land to vouch for the truth of what I have asserted.

I have several times solicited permission from the Commissioners to allow me an opportunity of exhibiting to them personally, in Delamere Forest or elsewhere, the good effects of my practice, for it is no theory; (and this I once more do), being convinced that I could have renovated nearly every unhealthy stunted tree in it, even those which refuse to grow higher than a table. I could also show an example of the excellent effects of my plan in a plantation on the Lathom Estate, the trees on which, from various causes, were in a very stunted, unhealthy condition, in fact deemed past recovery, and they always would have remained so, had they not been scientifically operated upon before they were past recovery. The effects produced, although the means were only applied so late as July last, have been truly magical for so short a time; but what will these trees be? If the instructions I have given be fully understood and followed up for the next two years, they will then exhibit the appearance of those on Duddon Heath plantation, before described. I must beg leave to remark, however, that I ought to be in those plantations in Cheshire, at least to point out particular instances of what can be effected by science and art, as I do not think it fair or right that my practice and system should or could be correctly explained by a second or third person.

It is generally supposed that Oak timber from sandy soils is not so good for ship-building, and some other purposes, as that from stronger soils; neither is it supposed to arrive at so great a bulk. Be that as it may, is it not vastly superior to and more valuable than many other kinds of timber trees usually planted on such soils? If I recollect rightly, I am under the impression that the ancient Forest of merry Sherwood, and other places in Nottinghamshire, renowned for the production of fine Oak timber, consisted chiefly of sandy soils. However that may be, I have certainly seen in numerous instances fine Oaks growing on sandy soils, and even out of the horizontal fissures of sandstone rocks.

It appears from the reports in the Blue-books recently published that the Commissioners have asked the opinions of several persons who have scarcely had any practical experience in forest management; while my experience, which has extended over half a century and more, and which has been so often tendered, has been rejected as worthless, except when I was employed in Dean Forest, and for the first three or four years in the Chopwell Woods.

Irrespective, however, of mismanagement, might not the inferiority of some Oak timber be owing to Quercus pedunculata being solely employed, as I have not found any of the other species, Q. sessiliflora, in the parts of Cheshire and Lancashire, where I have been staying during the past summer: on the other hand, sessiliflora, or knot acorn, abounds in Wales, particularly in the neighbourhood of Powis Castle, and on the banks of the Derwent in Durham, whose timber is noted for its superiority over that from many other parts of England. This, I have observed, is the species generally found in the old indigenous woods; but in almost all planted woods the inferior sort (pedunculata) abounds—a circumstance which I attribute to the latter producing much larger and finer acorns, which naturally cause it to be sought for by collectors for nurserymen, and others who raise Oak plants for sale, &c. All wood-cutters, carpenters, and sawyers, with whom I have conversed on the subject, however, agree that Q. sessiliflora

produces much finer and firmer timber than Q. pedunculata; but, for the reason just stated, Q. pedunculata is preferred by nurserymen and others ignorant of the different qualities of the timbers of the two—hence the propagation of the inferior species is almost universal, and that of the "gnarled unwedgeable Oak" of former times is neglected.

I shall conclude with reiterating my proposition that the miserable Oak plantations in Delamere Forest are susceptible of renovation at a trifling expense by a proper method of treatment; and if no other person can be found capable of performing the operation, I am. *William Billington, Roy, Belmullet, Mayo, Ireland.*

PHŒNOCOMA PROLIFERUM.

This is, perhaps, the most useful of the Everlastings, and also one of the most attractive of hardy greenhouse plants. It is by no means a difficult plant to manage, but somehow the majority of cultivators do no good with it, for a fine specimen of it is rarely seen, except where growers are within the influence of the metropolitan exhibitions. The most probable cause of the many failures experienced with this plant is, that it will not submit to the starving system without losing its bottom leaves; and in order to counteract its naturally somewhat thin and erect habit of growth, it must be perseveringly stopped, or cut back, as may be requisite to secure a close bushy habit.

Beginners should procure well established strong bushy plants, in 5-inch pots, which will afford a fair opportunity of producing handsome specimens, and will be a considerable saving of time compared with obtaining young plants from cuttings. Every care should be exercised, however, to secure well propagated, vigorous, healthy plants, for there are many examples of this plant in nurseries which are only fit for the rubbish heap. In March, the plants should be examined at the root, and if the pot is tolerably well filled with healthy active roots, give a moderate shift, using prime rich fibry peat, broken up into small pieces, not larger than a garden Bean, carefully intermixed with about one-third its bulk of clear sharp silver sand, and some lumpy bits of charcoal. In potting, use plenty of drainage well arranged, and be sure to have the ball, &c., in a proper state as to moisture, and make the fresh soil rather firm in the pot to prevent the water from passing off too freely through it. After potting, place it in the closest part of the greenhouse, or in a pit which can be kept rather warmer than the ordinary greenhouse, and give a very careful supply of water until the roots lay hold of the fresh soil. When growth becomes apparent after potting, the shoots should be cut back as much as may appear necessary to secure a close bushy growth, and after cutting back they should be nicely tied out, keeping them as open as possible, in order to admit light and air to the foliage. Keep the plant near the glass and admit air freely on mild days, for there will be no gain in keeping it close and warm, as this would tend to induce thin weakly growth, but secure a moist growing atmosphere, and draw the syringe lightly over the plant on the afternoons of bright days. When the weather becomes mild and settled remove the plant to a cold frame, which will form the most convenient situation for it in summer, and regulate the admission of air, &c., according to the state of the growth. A thin shade should be thrown over the glass for a few hours on the forenoons of bright sunny days, and the atmosphere should be kept as moist as it conveniently can be. If all goes well, a second shift will be requisite in June, and the plant must not be allowed to suffer for the want of pot room. Observe the same conditions in shifting as recommended above.

When the roots are supposed to have got hold of the fresh soil, which will be easily known by the growth, the main shoots must be stopped or cut back in order to throw strength into the side branches; for if the main shoots are allowed to follow their own course the plant will soon become very thin and bare at the bottom, and this will not be remedied without a free use of the knife and a consequent loss of time. Discontinue shading as early in autumn as it can be safely dispensed with, and expose the plant more freely to air in order to get the wood firm before winter, for the foliage is apt to become foxey unless the wood is moderately well ripened. Towards the end of September, or as soon as damp cloudy weather begins to prevail, remove the plant to the greenhouse, placing it near the glass, and where it will receive a free supply of air on every favourable opportunity, and give water very carefully during the dull season. If the same treatment as recommended for the first season is practised for one or two more years, the plant should be a nice sized specimen for blooming; but if a large specimen is the object the plant should not be allowed to bloom too soon. And in the case of a plant intended for flowering the following season, stopping or cutting back must not be practised later than June, as the young wood must be well matured in order to secure a fine display of blossom. Large thick specimens must all be kept in a rather dry airy situation in winter, and frequently turned round so as to expose all their parts equally to the light and air, but avoid cold north or north-easterly winds. The plant generally opens its flowers about the beginning of June, and it will go on producing a succession of its pretty blossoms until December. But if the object be to keep the specimen in good condition as long as possible, which of course it should be, the plant must never be removed to a close place while in flower, but should be kept in a cool, airy part of the greenhouse, and near the glass, shading from bright sunshine. Also give attention to stopping any shoots which may incline to outgrow the others; and if necessary to keep the bottom well furnished with healthy young wood, the shoots must be cut back, even at the expense of losing a season's bloom. Attention must also be given to shifting as may be necessary to keep the roots properly supplied with pot room, and water must be carefully supplied, especially to large specimens when in a dormant state. *Alpha.*

Home Correspondence.

How to Grow Pears in Perfection.—To do this you must have a Pear tree house. I will describe mine; it is span-roofed, 20 feet wide, 40 feet long, 4 feet high at the sides, and about 10 feet high in the centre. The rafters (which are fixed, for I have no sliding lights), are 4½ inches by 1½, and 20 inches apart. It is glazed with 16-oz. sheet-glass. The roof is supported by Oak posts 5 feet apart let into the ground. Between these I have made my walls with clipped Yews and Arbor-vitæ. I think, however, that the latter like the drip better than the former, as I have no troughs. The variety called in the nurseries the Siberian Arbor-vitæ (Thuja Wareana) is the more compact, and makes the prettiest hedge, but the common or American Arbor-vitæ does very well. The ends are boarded up with half-inch boards; glass would look better; and a door is at each end, over which is a shutter on hinges to let out the heated air in sunny weather. My beds are as follows: In the centre I have one 7 feet wide, and on each side one 4 feet wide, my two paths are each 2½ feet wide; the beds are raised 1 foot, or three courses of brick-work. The soil in the beds was manured and well stirred to about 2 feet in depth previous to planting the trees. In the central bed I planted three rows of pyramidal Pears, on Quince stocks, 3 feet apart, in this way * * * and in the side border I planted dwarf Pears on Quince stocks as bushes, 3 feet apart, two rows in each bed, thus * * * I top dress them with manure in spring, and water them frequently in spring and summer, and once a week with manure water. I thin out the blossom buds, thin out the fruit, and pinch off the shoots when required. The climate is always so delightful when these operations ought to be performed, never oppressive, that I spend much time in what I sometimes call my Pyretum, and I firmly believe that in spring, summer, and autumn, whenever we have a little sunshine the climate of these hedge-houses is the most perfect that can be imagined. The trees grow slowly but healthily, and bear in profusion. The fruit is most beautiful, the skin being fine and delicate, and, as the trees are never shaken by the wind, it hangs a long time, the very late sorts of Pears coming to great perfection. In short, these hedge-houses are the only places to grow Pears in perfection. I have only to add that this way of growing Pears is not my own invention. I learned my lesson from a gentleman whose name is often in your columns. *Hortulanus.*

Cure for Grape Mildew.—Take ¼ lb. of black soft soap, from 3 to 4 ounces of black sulphur, the same quantity of soot and quick lime, and add water sufficient to enable them to be worked with a paint-brush. As soon as the Vines are pruned, paint the wood well over with this mixture, rubbing it well into the rough parts with the brush. I have not seen the least symptoms of mildew since I have used it, either in the houses or out of doors, although we had plenty of it before the application was tried. This, therefore, may be worth the notice of Vine growers in foreign countries, the ingredients employed being cheap. *John Hayes, Farnham, Surrey.*

Hardiness of Conifers and other Plants.—I send a list of Pines, whose hardiness appears to require confirmation. At Hafodunos, 800 feet above the sea, inland, the following are hardy:—Cedrus Deodara, Libani, and atlantica; Pinus Hartwegi, insignis, excelsa, cembroides, muricata, zubuculata, osteospermum, macrocarpus, pitchta, taurica? Ayacahuite, monticolus, Lambertiana, pinsapæ, and cephalonica; Abies Menziesi, Douglasi, Smithi, and Pindrow; Taxus japonica, adpressa, pyramidalis, elegantissima, and foliis aureis; Taxodium sempervirens, Araucaria imbricata, Cryptomeria japonica and Lobbi, Fagus antarctica, Deutzia coccinea, Philadelphus sp. californica from the Horticultural Society, and Sammerdamia. Of the Sikkim Rhododendrons, I only find completely hardy the following: Ciliatum, cinnabarinum, fine scarlet, 1400 feet; glaucum, æruginosum, campylocarpum, niveum; and the three last appear to me the same, probably all niveum; but I got them as named from Mr. Masters. Nothing can be hardier than Berberis Darwini and droserifolia, and they are beautiful. Platycodon sinensis dies down to the root, but comes up strong every spring. Aralia japonica flowered in the open air well with me this year; of course it is not left out in the winter. Fabiana also flowered freely, and it is left out. Cerasus ilicifolia will not stand a severe winter here; Arundinacea falcata is hardy. Can you tell whether it likes wet or dry soil? I have a pot of it growing half its depth in water, and it seems to like it, and grows more rapidly than any other plant I have. Many others that I hope will be hardy I have not yet proved, such as Pinus Jeffreyi, Wellingtonia, Fitz-Roya, Saxe-Gothæa, Skimmia japonica and laureola. Am I right in expecting these to be hardy? I must not forget Ilex dyperena, which is perfectly hardy; opaca and latifolia japonica only in sheltered situations. *Henry W. Sandbach.*

Rheumatism.—Gardeners being very subject to heats and colds often suffer much from rheumatism. Having been much afflicted with it myself I wish to give them the benefit of my experience. Take one raw egg well beaten, ½ a pint of vinegar, 1 ounce of spirits of turpentine, ¼ of an ounce of spirits of wine, and ½ an ounce of camphor, put them into a wine-bottle and shake them well for 10 minutes. In half an hour the mixture will be fit for use, when it should be well rubbed on the parts affected three or four times a day. In several instances this has effected a cure in a few days; but essence of mustard is best for bad cases. This is good for all outward applications in man or beast, green wounds, sprains, bruises, broken-kneed horses, saddle galls, and bit galls. No farmer should be without it. *John Hayes, Farnham.*

The Fluke Potato.—Having seen a good deal in praise of this potato, I have been induced to order a quantity for seed next year, but I am surprised to find what have been sent to me to be white, and very many diseased. Now a short time ago a friend of mine showed me some Kidneys, which he called Flukes, and they were blue. Will you therefore say whether the true Fluke is blue or white, and whether it is early, second early, or late, because on boiling some of those I have got they are quite "livery," and unfit for food. *J. B.* [This variety is white, late, very mealy, and not at all likely to be diseased. We have seen no sign of the affection.]

Wintering Antirrhinums.—The most economical method of wintering named sorts of Antirrhinum is to strike the cuttings under hand-glasses, either on a cutting bed or shady border, as soon as possible after the stock plants have done flowering. When the young plants have got established, pot them singly into 3-inch pots, using for compost two-thirds turfy loam, one-third broken lime rubble, to which should be added a small portion of leaf-mould and a little sharp sand. The plants should then be placed on the dry level bottom of a cool frame, and until the roots have penetrated the fresh mould, the plants should be kept close, and shaded from the effects of the midday sun. After which, except in continued wet weather, the lights should be taken off altogether, and not be again replaced until the autumn rains render such a step desirable. Treated in this way the young plants make considerable growth, and fill the pots with roots before the winter sets in. The most effectual way of protecting the plants from the ravages of slugs and snails is to place them in the frame on inverted pots: this will have the effect of raising the plants nearer the light, and by thus increasing the facilities for drying the frame, the plants will be less liable to be injured by damp. By raising the frame an inch or so from the ground, a constant supply of air in the most unfavourable weather may be admitted. The state of the weather is the only criterion by which to regulate the application of water; in close damp weather, for instance, a fortnight, and sometimes three weeks, may be allowed to elapse with advantage between the waterings. Care should be taken not to scatter the water about or wet the foliage. Let the weather be ever so severe, air never comes amiss to Antirrhinums. The object in placing them in frames is to protect them from rain and snow, but not frost: when sheltered from the two former, any danger resulting from exposure to the latter need not be apprehended; for with plenty of air, and proper care with respect to water, the conditions necessary to the winter preservation of Antirrhinums are complied with. *R. Miles.*

The Late Winter.—The remarks which have been made from time to time in your columns, relative to the effects of the past winter on plants in the open air, in different parts of the kingdom, have led me to make the following, which will, in some measure, tend to show the extreme difference of temperature in Cornwall and other parts of England not far distant. Marica Sabini, from the island of St. Thomas, western Africa, has stood in the open air here for the last four or five years, without any protection whatever. Although it is killed close to the ground every winter, it always grows up again in summer. It is now 18 inches high, and will soon be in bloom. "This Marica," says Dr. Lindley, in "Transactions of the Horticultural Society," "is easily propagated, and will consequently soon become, on account of the beauty of its flowers, one of the finest ornaments of our stoves." Araucaria Braziliana has also stood unprotected without being injured in any way. Some of the plants of this noble Conifer are as much as 21 feet in height. Cantua bicolor, planted in a warm border in front of a greenhouse, merely lost its leaves. Plagianthus Lampeni, Dacrydium Franklini, Ceanothus rigidus, Pittosporum tenuifolium, and Berberis Darwini, were all unhurt. Gnidia simplex and Indigofera decora, though much cut, have since grown well, and both are now beautifully in flower. *Frs. Symons, Carclew, Cornwall, Nov.* 1.

Substitute for Mats.—Get coarse wrappers from the drapers, such as their goods are packed in, about 6*d.* per yard run, 5 feet wide. Paint them with the Bridgewater mineral paint, which may be bought of Mr. Levett Frank, oil and colourman, 44, Borough, London Bridge, at 24*s.* per cwt. Mix it with double boiled oil, at 4*s.* per gallon. Two gallons of boiled oil, and 3*s.* worth of the Bridgewater paint are sufficient for 16 yards run, at 5 feet wide; that is 19*s.* for 16 yards. This will last for many years. The paint must be mixed as thick as you can use it, in order to fill up the pores of the cloth, and when it is painted it is quite as pliable as it was before the paint was put on. The direction for use says two coats, but I only put on one. In the course of a few years' wear it may, perhaps, want a thin coat. Nail

the pieces as you buy them against a wall or paling to paint them on. The paint will dry in 24 hours. Then sew the pieces together, the size of the space you want to cover, with pack-thread dipped in the paint. If to cover a house, work a strong hole with the pack-thread to hang the material by on a large-headed nail. Drive a piece of inch-board about 2 inches wide and about 9 or 12 inches long under the plate, between the brick-work and the plate, about 4 or 5 feet apart, for the cloth to fall on when the roof is uncovered; it requires no drying; it is waterproof, and the direction says fireproof. The best thing for it to fall on would be some pieces of iron screwed on under the plate, with a joint to turn under when not wanted. This, when well prepared, is the cheapest and best covering that can be got. *John Hayes, Farnham.*

Notices of Books.

Catalog der Orchideen-sammlung, &c. (Catalogue of the collection of Orchids belonging to G. W. Schiller, of Ovelgönne, on the Elbe.) Hamburgh: Meissner. 12mo.

This is the best catalogue of garden Orchids which we have seen, and being remarkably well printed, would prove a useful manual for English collectors. The nomenclature adopted is that of Mr. Reichenbach, and we presume may be almost regarded as proceeding from his pen, which gives it a scientific value rarely possessed by garden catalogues. To nurserymen and others it is a good work of reference, enabling them to identify the new German names with the plants already known among us. Thus, upon looking to Warrea in the Catalogue, it will be seen that *W. candida* is now named *Warczewiczella candida* in Germany, and *Warrea graveolens, Köllensteinia Kellneriana.* Unluckily it is not stated under the new genera what the old plants are which they include, and so far the plan is incomplete. We dare say Mr. Schiller will remedy this in his next Catalogue. There is no descriptive matter whatever in the pamphlet; we can, therefore, only guess at the frontispiece representing this gentleman's Orchid-houses, and the tail-piece his own dwelling on the banks of the Elbe.

The Stepping Stone to Animal and Vegetable Physiology (Longmans) serves to show how much more eager than judicious some persons are to cram children with crude and erroneous notions. No class of books demands more skilful exactness than those intended to instruct the young; for false ideas gained in youth are rarely eradicated; we find no such skill in the trifle before us.

A Visit to the Seat of War in the North (Chapman and Hall's Reading for Travellers) is a short guide book to the coasts of the Baltic. It is written with care, and indicates some personal acquaintance with the places described; but it is too concise for a travelling companion, and will be hardly found satisfactory by those who are interested in naval possibilities. It is, however, well suited to the railway carriage, which, we presume, is all that it pretends to.

Frazer's Handbook for Travellers in Ireland, 4th edit. (Dublin, McGlashan) has long ago established itself in public estimation, and only required that the changes in it rendered necessary by the introduction of railways should be effected. This has now been done, with the addition of a good map of Ireland; we therefore anticipate no abatement in the popular favour with which it has been received. We would, however, suggest that it would be still more acceptable if natural history, especially botany, were treated in very much greater detail. Dr. Mackay's sketch is good as far as it goes, but the localities of rare Irish plants should also be given under the names of the places where they occur.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—The little Oxalis Bowei, mentioned in our last report as being beautifully in flower in a low frame in front of the Orchid-house, is still in full blossom, and its round rosy flowers, which we need not state are extremely gay, look as if they would remain in perfection for a month yet to come. This must therefore be regarded as a very valuable plant for early winter flowering.

Among plants in the curvilinear stove was one named Pilea muscosa, which, although by no means striking in appearance, will be found, when closely examined, to be extremely interesting, on account of the symmetrical and beautiful arrangement of its leaves, or rather branches, and minute rosy flower-buds, with which they are thickly covered, and which, before they open, tinge the whole surface of the plant with red. When expanded, the blossoms are white; but, although plentiful, they are small and insignificant. It is in the handsome Lycopod-like branches in which the value of this Pilea consists; and we are sure that all lovers of plants remarkable for fine form or foliage will find this a useful addition to their collections.

In the propagating house a well-grown plant of Clerodendron splendens was just breaking into flower, and along with it were Gesneras zebrina and Hibberti coming on for the decoration of the stoves. Begonia Thwaitesi was also in bloom here; it is a dwarf-growing species, with prettily variegated foliage, which is thickly clothed with purplish red hairs. The yellow-flowered Begonia xanthina was likewise in flower in this house; but the general collection of Begonias kept here for the decoration of the stoves in winter has not yet been brought into blossom.

Of the Potato Yam (Dioscorea Batatas), of which an account appeared at p. 467 of our current year's volume, a few plants have been struck in the propagating house under a hand-glass, and here where they have a little heat all of them have formed young tubers at the axils of the leaves. This effort to produce fresh tubers has not yet been observed either in the plant which is growing out of doors, whose branches have lately been layered, or in that planted under glass in the orchard-house. The progress of the cuttings as well as of the old plants has therefore become a matter of interest, and will be reported on from time to time in our columns.

In the Rose house the plants have thriven uncommonly well during the past summer, and have produced a good crop of flowers, and even now they are well furnished with buds and blossoms. The sorts are chiefly Teas, Chinas, and Bourbons, some of which flower nearly the whole year round; the value of a house of this description may therefore be easily conceived. The colours of the yellow and salmon kinds such as Saffranot, Vicomtesse Decazes, &c., are better now than they were in summer; and what can be more charming in a bouquet than a bud or two of these (when caught in good condition) favourite varieties? The crimson and other Chinas are also most brilliant, and next year when the plants shall have got properly established they may be expected to be much finer than they have been this season. The fault of the place is the absence of sufficient variety in colour, the majority being pale sorts.

Of novelties we observed a good stock of Campanula primulæfolia, which is reported to be rather a pretty variety of Campanula, from the Caucasus, and also a somewhat straggling plant, called Monnina obtusifolia, in flower. The latter is half shrubby, and has blue and yellow blossoms, which if they can be induced to come in sufficient abundance will render the plant useful for greenhouse decoration.

Chrysanthemums have been placed along the sides of the paths of the great conservatory; but with the exception of Hendersoni, which is now in flower, they will not be in full blossom for at least three weeks to come. The plants are beautifully grown, and well furnished with flower buds, so that when they do open their blossoms a fine display may be expected. The large Brugmansias, in the bed, which have lately been pruned and cleaned, promise soon to be again in flower, as do also Cestrum aurantiacum, a valuable conservatory plant, Luculia gratissima; Hedychium Gardnerianum, whose flowering is just over, has been very fine.

In a cool pit were some nice plants of Mignonette coming forward for the shelves of the conservatory and greenhouses; the seeds of this had been sown last August in pans, the plants pricked out into 3-inch pots, and afterwards transferred to 5-inch ones, in which they are to bloom. Various annuals, as Nemophila, Schizanthus, &c., have also been potted off to be grown on for the decoration of these houses.

Out of doors, by far the most striking plant is the Pampas grass, which at present is the admiration of everybody; as well it may, for a more beautiful plant there could not be. It has 17 noble flower stems issuing from among its long drooping foliage, each surmounted with a panicle of silvery inflorescence not less than two feet in length. The effect of these when seen under bright sunlight is truly charming. The plant, which is perfectly hardy, will be found growing on the bank at the entrance to the American garden.

An alteration is being made in the walks which pass the two ends of the summer-house at the top of the broad walk leading from the Duke of Devonshire's gate to the council room. The entrance to the last-named walk next the school-gate has been shut up by planting it with shrubs, while that on the other side of the summer-house has been more opened up by removing a few of the shrubs from that part, and forming rockwork in their place, which will be faced with a narrow belt of grass. The rocks are made of burs joined together with Portland cement, and then washed over with the same and sprinkled with coke-dust. In this way fine lumps of grey rocks, where such are scarce, may be cheaply obtained.

In the fruit room are a few good Glout Morceau Pears, from a west wall, and Beurré Diel, both from a west and east aspect. Those from the east are the largest; but it was stated that this might possibly be owing to the tree there being more vigorous than the other, from not having borne well in former years. Of Hacon's Incomparable there were also fair specimens, as well as some of Van Mons Leon Le Clerc, measuring 10 inches in length and 5½ inches in circumference. This is an excellent melting Pear, which is not even now known so well as it should be. Examples of Beurré Rance also measured 10½ inches in length and 5 inches in circumference. Of Apples we have unfortunately nothing to report this year, the blossoms having been nearly all killed by the frost of the 24th of April; and what fruit has come to maturity is not good, being mostly the produce of a second crop of blossoms.

Poles, near Ware, the Seat of R. Hanbury, Esq.—There is now in flower in the fine collection of Orchids grown at this place a plant of Cattleya labiata, with 15 spikes, and 75 flowers expanded; it is really a wonderful specimen, and we believe unrivalled in the history of Orchid-growing.

FLORICULTURE.

Ranunculuses. — There is a marked difference between the old varieties of this flower and the seedlings which have been raised during the last few years. The tubers of the former are generally less robust and plump; the foliage is often weaker, and the flowers are almost always inferior in size and substance of petal to those of newly-raised seedlings. The art of hybridising has been wonderfully successful with the Ranunculus, and some new beauties are annually produced. Unless the old kinds are very striking and unlike the modern varieties, the amateur is recommended to make his bed of new sorts. His success will be more certain, and the healthy and vigorous growth of the roots more satisfactory. A packet of carefully selected seed, purchased of a well known cultivator, will repay all the attention bestowed in raising it; but this task should be undertaken by one who has had some general experience in the growth of the flower. Three seasons must pass before all the seedlings can be expected to exhibit their character, and even then the quality they will finally assume cannot always be ascertained. Some of the finest sorts will at first be semi-double, and time is consequently required to test their real excellence. Raising from seed, therefore, is not the course to be pursued by those who are growing Ranunculuses for the first time; and although I hope to be able to assist in this interesting pursuit on a future occasion, it will be more requisite now to point out the best mode of getting a collection of well-known and established flowers. Without wishing in the slightest degree to question the integrity of seedsmen and florists, I feel it necessary to caution amateurs on the subject of purchasing Ranunculuses, as good kinds are expensive, and a failure is therefore very provoking. A very fine show may, indeed, be secured by one or two hundred mixed roots, which may be purchased at very small cost; and where a cheap bed is an object, or where the amateur fears to run a greater risk until he has acquired experience, mixtures may be recommended. But if you intend to raise a bed which shall excite the rivalry of your neighbours, and enable you to compete at a floricultural exhibition, you must be content to pay for flowers of a higher character, which are warranted true to name, and which may therefore be expected to repay you for your expense and care. Get them from the grower, if you can, for in changing hands seeds and roots often change names, and discredit the seller and vex the buyer. There are some celebrated growers of Ranunculuses who have devoted their energies especially to this root, and without mentioning their names, I recommend you to apply to them. You may select from their catalogues, and may rely on their sending you sound tubers. Indeed, if you state the size of your bed, you may leave the selection to them, as they are acquainted with the varieties whose combination will produce the happiest results. Another plan should be mentioned as suitable for those who may not be able or willing to incur much expense: get a dozen first-rate roots, and placing them in different parts of the bed, fill up the spaces with common ones. If you are obliged yourself to select, you must bear in mind that roots may be true to name, and yet in themselves useless. The great difficulty to be overcome in growing the Ranunculus is encountered after the bloom is passed away, and the roots will be either good or bad the following year, as they are then treated. On this subject very much might be said. The criterion by which a healthy root is known, is the plumpness of the forked portions, and the fine velvety texture of the crown; especially the latter. The tuber itself may be small and shrivelled, and yet the crown will indicate a sound condition; while, on the other hand, a plumpness of the tuber is of no service if the crown is dull, and instead of becoming bright when rubbed by the hand or on the coat, crumbles away. Like the Dahlia, the tuber of the Ranunculus will be quite healthy in itself, even where all the young buds or eyes are destroyed; it may even live some time in the ground; but vain will be the expectation of seeing a green shoot! When the substance of the tuber is well filled, and the crown is glossy, success may be confidently expected, as far as the roots themselves are concerned. It should be remembered that the silkiness of the crown, although always present in some degree, increases as the growing season advances. The Turban Ranunculus makes a very splendid show, and I wonder it is not more grown in large gardens, as beds of it, each filled with flowers of one colour, would have a most imposing effect. The various kinds of Turbans may be purchased for 3*s.* or 4*s.* a hundred. As an early flower, it is worthy notice. I have had yellow Turbans off bloom and ready to be removed by the second week in June, in time for filling the beds with other plants. The Ranunculus may be taken up without injury as soon as the flower is withered, if the mould is allowed to adhere to it, and all the roots thus removed are put into the ground in a place secured from rain. They will then gradually become fully matured, and may be cleared away in July. This latter circumstance removes the objection of the beds being occupied too long to allow their being afterwards filled with flowering plants. Half-a-dozen beds on a Grass-plot would present a gorgeous sight in May and June. *S.*

Verbenas: *C T.* Your new kind called "Wonderful" is a beautiful rich plum-coloured variety, with a bold white eye; pips and truss large, and well shaped. A very striking variety, which must necessarily be a favourite both for pot culture and for beds.

Miscellaneous.

The Chestnut (Castanea vesca), celebrated amongst European trees for the enormous size it will attain, is already mentioned in the Bible. Theophrastus and Athenæus give it the name of Eubœan nut, from the island of Eubœa, now Negroponte, where it was peculiarly abundant. Pliny says that Chestnuts first came from Sardi, the ancient capital of Lydia, and not far from the modern Smyrna. Gelenus, who was a Lydian, confirms that origin, and says that they were also called *balani leuceni*, from Leucene, situated on Mount Ida. Other writers, ancient and modern, give various Eastern countries as the native stations of the Chestnut, and even Giovanni Targioni-Tozzetti, our author's grandfather, believed them to be introduced only into Italy; but not only have the extensive Chestnut woods in the Apuan Alps and other parts of the Apennines, mentioned by Bertoloni, every appearance of being really indigenous; but further evidence that woods of this tree existed in Tuscany from very remote times, may be found in the number of places which have derived their names from them, such as Castagna, Castagnaia, Castagneta, &c. We may indeed safely give as the native country of the wild Chestnut, the south of Europe, from Spain to the Caucasus. It does not extend to East India. The larger fruited varieties which we import for eating, and which are generally distinguished in France and Italy under the name of marrons or marrone, were probably those which were first introduced from the East by the Romans. Pliny enumerates eight different varieties. Micheli has 49, most of which, however, from his own specimens, are, as in the case of the other fruits mentioned in his manuscript, founded upon distinctions too slight to be really available for their separation. *Journal of the Horticultural Society.*

Sale of Rare Plants.—The plants to which we drew attention last week, at p. 692, were sold by Mr. Stevens for the following prices:—Of the six double Cocoa Nuts of the Seychelle Islands, one fetched 10*l.*, another 5*l.*, and a third 3*l.*; the others, which were dead, brought from 10*s.* to 12*s.* each for their shells. The singular Stangeria paradoxa realised from 12*s.* to 2*l.* 4*s.* each. One plant of the reported new Ansellia from the Zulu country fetched 4*l.*, a second 3*l.*, and a third 2*l.* 10*s.*; the rest fetched from 1*l.* 3*s.* to 2*l.* per lot.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Flowers have now become scarce out of doors, and will be more valued here in consequence; and every exertion should be used to keep this house well furnished during the winter months. It is not so important, however, at this season that only handsome well-grown specimens should be introduced, as it is when flowers are more abundant elsewhere, and almost any gay-looking plant, however common, will be very acceptable in winter. But the use of such things is only tolerable where accommodation is insufficient to grow a proper quantity of our best winter flowering plants, and where there is a necessity for resorting to the use of common things, every exertion should be used to secure neat, trim, well-flowered specimens. For as this class of plants is generally looked upon as being only valuable while in flower, it is a very common practice to bestow but little attention upon them in the way of staking, &c., before placing them in the conservatory. Let Japan Lilies that have done flowering be removed to where they can be kept dry; a cool vinery, where they will have plenty of light and air, will be a suitable place for them until the foliage decays, &c.; for, although these fine plants are hardy, and submit to almost any treatment, those who grow them in perfection are very careful to well ripen the bulbs in autumn. Cold Pits.—Get straw shutters prepared for covering the frames containing the half hardy stock. These, if well made, are somewhat expensive in the first instance, but they are, perhaps, the cheapest in the end of anything that can be used for this purpose, and are also very efficient and certainly do not cause so much breakage of glass nor litter as mats. Expose the stock here freely to air on every favourable opportunity, in order to check growth and get the wood firm, in which state it will be much less liable to suffer from damp, &c., than if kept close and coddled with too much warmth and moisture. Except for plants in full growth, very little water will be wanted at the root; but look over the stock frequently, withholding water until it is absolutely wanted, and then give a moderate soaking, which is the safe way of avoiding either extreme. Heaths, &c., that are subject to the attacks of mildew must be carefully watched, and dusted with sulphur immediately the enemy is perceived; and if greenfly makes its appearance, apply tobacco smoke without loss of time; but these pests will not be much trouble except where the plants are kept too close or otherwise improperly treated. A few of the tree Violets and Carnations, if they are wanted in flower at once, may be removed to a pit or house where there is a gentle moist heat, supplying them with plenty of weak manure water at the roots. Orchids.—Many of these will have completed their season's growth by this time, and when this is the case they should be removed to the coolest and driest end of the house, in order to avoid further excitement, which would be most injurious at this stage. Also gradually lessen the supply of water at the root. Those in free growth will, however, require to be kept warm and moist, but the syringe must be used very sparingly, and a sufficiently high temperature maintained during the day, to allow of giving a little fresh air, for the young growths of most of them are soon injured by a damp stagnant atmosphere. Let those in flower be well cared for, placing them where they will neither be liable to suffer from damp nor the want of sufficient moisture in the atmosphere. If any of the specimens are infested with insects take the earliest opportunity of getting them thoroughly cleaned. Also tie up large specimens, and spare no pains to do this in the neatest and most effective manner.

FORCING DEPARTMENT.

Pineries.—Where the bottom-heat is obtained from fermenting materials, any addition of fresh tan, or whatever else is used, that may be deemed necessary to maintain the proper heat for the winter, should be made at once, so as to avoid having to disturb the plants after winterly weather sets in. In adding fresh fermenting matter, see to having this in a rather dry state and to having it well intermixed with the old, which will prevent excessive fermentation at the first, and cause the heat to be more regular and enduring. While the plants are being passed through hand, any of the young stock that may appear to want more pot-room should be examined and shifted, so as to avoid the necessity of having to disturb the bed again during the winter. Do not make the tan or plunging material too firm about the pots until it can be seen how the fermentation goes on; for it will be easier to firm the tan about the pots when it can safely be done than to raise the plants in the event of the heat becoming too strong. The aim should be to secure a steady bottom temperature of 80° or 85°, and the roots should not be subjected to a higher temperature than this during the winter season. Plants in pits, where the heat has to be maintained by dung linings, cannot be kept growing after this season without drawing and very much injuring them. The linings should be kept sufficiently strong, however, to allow of giving air pretty freely every fine day without lowering the temperature too much, and a little fresh air should be admitted constantly, except in case of frost. Stock that is considered to have completed its growth, and is in course of preparation for showing fruit directly after Christmas, should be kept dry, maintaining a sufficiently high temperature to allow of giving air freely on fine days. The bottom-heat for these need not exceed 80° while the object is merely to ripen the growth, and the soil about the roots can hardly be kept too dry. Vineries.—If not already done, get the outside borders of all the houses covered with something to throw off the wet and retain what of the summer heat remains in the ground; for it is very bad policy to defer this until it is hardly worth doing, which is the case when it is put off till after severe weather sets in. Look over former directions, and keep ripe fruit dry and airy. If the Vines have been infested with black thrips, look sharply after these pests, and give the house one or two good smokings, for it is of the utmost importance towards the fruit keeping well that the foliage should be preserved in health as long as possible, and if the thrips are destroyed now there will be no more trouble from them this season. Figs.—The second crop will now be over in most cases, but where the wood for bearing next year is not properly ripened the trees should be carefully attended to until the wood is in such a state as to offer a fair prospect of a crop next season. Keep the shoots thin, removing every bit which is not likely to be retained for bearing, and endeavour to maintain a rather warm airy atmosphere, and let the plants be rather dry at the root. Those in pots or tubs must not, however, be allowed to get too dry until the wood is well matured. Where the wood is ripe, &c., get the trees thoroughly cleaned, and keep them cool and airy, but do not expose them to frost.

FLOWER GARDEN AND SHRUBBERIES.

Those who purpose making additions to their collection of Roses should do so at once, as there will be a better chance of obtaining good plants now than after the nursery stock has been repeatedly picked. And the present season is also very favourable for planting all but tender sorts, which had better be kept under glass until next May, but these should be procured at once, and if they can be placed in a gentle heat through the winter, they will grow freely, and furnish cuttings which will root just as freely as a Verbena. In preparing ground for Roses let it be trenched at least 2 feet deep, and well incorporate a very heavy dressing of manure with the soil to the full depth. It is hardly possible to make the soil too rich for any kind of Rose, particularly the autumn-blooming kinds, and 4 or 6 inches of good rotten farm-yard dung will not be too much where the soil is naturally rather light and poor. Large headed standards that have done bloomiag for the season should be cut back pretty freely, to lessen the chance of their being injured by heavy gales of wind. Continue to clear the beds of their summer occupants as these become unsightly, and after trenching or doing whatever can be done to save time at next planting out season get them furnished for the spring. Also look over the herbaceous borders, and make any projected alterations there, taking up and dividing any of the coarse growing kinds that may be inclined to encroach too much upon their neighbours. The modern system of gardening is fast driving this class of plants out of cultivation; but many of them are really beautiful, and if they were more largely grown our gardens would not have that naked appearance in spring which is too often seen. Sweep and roll Grass frequently, and keep gravel walks hard and smooth by frequent rollings.

HARDY FRUIT AND KITCHEN GARDEN.

Beyond transplanting and root pruning, or planting fresh trees, there will be but little here requiring immediate attention, and advantage should be taken of any leisure time to get these operations forwarded as expeditiously as possible, while both the season and the weather are favourable for such work. Let there be no lack of attention in the fruit room at present, for fruit requires more care during the first few weeks after gathering than all the season afterwards. Keep the room cool, giving sufficient air to carry off damp, and remove tainted fruits directly they are perceived. We may now expect sharp frost at any time, and all necessary preparations should be made at once, such as having a good stock of the most forward Lettuce and Endive where they can be protected in case of need. Celery should now be earthed up pretty close, choosing the first dry day when the ground is in a rather dry state for the operation. If not already done, take up and store Carrots, Beet, &c. These are best stored in sand or soil in the root-house, or where they can be conveniently got at, and not exposed to the weather. Cauliflower in head, if not wanted for use, may be pulled and hung up, with the head downwards, in an open shed where it will keep good for weeks, and will be out of the way of injury from frost unless this should be very severe. Turn the refuse heap, and well soak it with manure-water to hasten decomposition, and get it ready for wheeling upon the ground when frosty mornings occur.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Nov. 2, 1854, as observed at the Horticultural Gardens.

Oct. and Nov.	Month's Age	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth. 1 foot deep.	Of the Earth. 2 feet deep.	Wind.	Rain.

Satur. 11	51.3	37.5	43.4	12	1.02	2	4	3	—	1	7	4	1

The highest temperature during the above period occurred on the 5th, 1852, and 6th, 1834—therm. 63 deg.; and the lowest on the 11th, 1829—therm. -1 deg.

Notices to Correspondents.

Araucaria and Deodar: *W H B.* We would recommend you to raise *low* mounds for them.‡

Aspects for Fruit-trees: *R G T.* To the answer given at p. 648 we can only add that we do not know what Mr. Rivers would consider the appropriate aspect for fruit trees.¶

Brugmansia sanguinea: *J L.* It is a hardy greenhouse or rather conservatory plant; yours is doubtless kept too warm and moist, which is the cause of its not thriving.‡

Insects: *Cobham.* Your insect is the pupa of a beetle, which is frequently found in brown Sugar from the West Indies. *J. C.—G H.* The grub you mention has not reached us.

Jerusalem Artichokes: *Q Q.* The flowering of a bed of this plant with you is as you state, "a very unusual occurrence, and a mark of the peculiarity of the late season."

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* 1136 and 1040, are indeterminable without full-grown leaves and acorns; 1011 and 1045, Carpinus Betulus; 1007, Carpinus orientalis.—*Milne Graden.* Your "Indian Potato" is the Apios tuberosa, or Saa-gaa-ban, of which you will find an account at p. 165 of our volume for 1849.‡—*Lightcliffe.* Pernettya mucronata.‡

Nymphæa Elegans: *A H.* says—"This pale blue Water Lily is figured in tab. 4604 of the *Botanical Magazine:*" with an intimation that, being a New Mexican plant, it was likely to prove hardy under our waters. He will, therefore, be obliged by some of our correspondents informing him "what experience there now exists upon that point."

Rain Gauge: *Rain.* To calculate inches of depth, in measuring rain-fall with a measuring glass, graduated to cubic inches, you must first ascertain the area which the mouth of the funnel, or other receiver presents. Then divide the number of cubic inches of rain by the area, in inches, of the mouth of the receiver; the quotient will be the depth of rain. For example, supposing that exactly within the edges of the receiver is a horizontal area of 100 square inches, and that you measured 110 cubic inches of rain-fall; then 110 divided by 100=1.1 inch, or a depth of rain on a horizontal surface equal to 1 1-10th inch. If you had only one cubic inch of rain; 1 divided by 100=.01, or 100th part of an inch of rain.¶

Sour Milk: *R D.* We never heard that the smell of flowers would turn milk sour.

Strawberries: *A Lady* will be obliged by the gentleman who received six plants of the Nimrod Strawberry from Mr. Pince, of Exeter, in pots, informing her whether he removed them from the pots and planted them in the open ground, or inserted the pots in the ground without disturbing the roots?

Trade Memoranda: *J H.* We know nothing of the parties named by you: nor is there much in what you say. Never forget the maxim *Caveat emptor.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT SOWING.—The undersigned beg to call attention to their WHEAT MANURE, which has been successfully used during the last two seasons, and which they are prepared to deliver at 6l. per ton, free to Railway.
They are also Sole Agents for the sale of PEAT MOSS CHARCOAL, which is a valuable deodoriser and distributor of ammoniacal matter.—English and Foreign Linseed and Rape Cakes, Guano, Superphosphate of Lime, Salt, Bones, and all other Manures of known value on sale.
Apply to MARK FOTHERGILL & Co., 204, Upper Thames Street.
